VOLVME CX.

JAN TO JVNE 1916.

THE BVILDER

AN : ILLUSTRATED : WEEKLY MAGAZINE : FOR : THE ARCHITECT : ENGINEER : ARCHÆOLOGIST : CONSTRUCTOR : SANITARY - REFORMER : AND ART-LOVER.

"EVERY man's proper mansion-house, and home, being the theater of his hospitality, the seate of selfe-fruition, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kind of private princedome, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned."

"Architecture can want no commendation, where there are noble men, or noble mindes."—SIR HENRY WOTTON.

"OUR English word To BUILD is the Anglo-Saxon Bŷlðan, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."—DIVERSIONS OF PURLEY.

"ALWAYS be ready to speak your mind, and a base man will avoid you."—WILLIAM BLAKE.

THE BUILDER

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

VOL. CX.—No. 3805. JANUARY 7, 1916.

THE PRESENT AND FUTURE.

THE year which is past has been in every way an abnormal one, and, looking backwards, we feel that the wonder is not that our national industries have been disturbed and dislocated, but that they have not suffered more from the effects of the tremendous conflict now being waged over the greater part of the Old World. That industry has not been more affected is due to the efficiency of our sea power and the fact that the Allied nations now facing Germany and Austria are convinced of the necessity and righteousness of the war and of the inevitable triumph which will bring it to an end, leaving to the nations of Europe a lasting peace such as its peoples have not known since the days of the Roman Empire. Whatever Europe may go through in its period of trial, it is certain that generations yet unborn will be freer, happier, and more prosperous because of a settlement only to be reached through war; while it will seem to them an epic period, marked by deeds of heroism and high endeavour. Commercially, what may be called the United States of Europe are in process of formation in the stress and unrest of war, which, while it has served to define and accentuate all that is best in nationality, also emphasises the advantage of united efforts and the existence of common interests. The present war is likely to mark the death of the old system of armed tyranny and the beginning of a new era of better understanding of the wants of humanity, and of the organisation by which these wants can be most effectively met.

Every profession and trade has contributed its quota to the armed forces of the country, and many sections of the working classes have enjoyed the greatest prosperity they have ever had—a circumstance which will have its effect on social problems in the future and must strongly affect the industry of building. High wages, an improved standard of living, coupled with the fuller knowledge which those who have served side by side in the trenches will have of one another, are bound to break down the barriers which separate class from class, and to bring in their train a recognition of the necessity for better accommodation for the dwellers on the land. The war has, in fact, accelerated housing reform by spreading the conviction that slums in country and town alike must be done away with. The greatest socialists among the working classes will have learnt, by actual example, that the upper classes are willing to face danger, hardship, and death for the nation, while they in turn will recognise that the workers of the land who have made the same sacrifices have an inalienable and natural claim to demand that the conditions of life of the workers should be made good and healthy ones. Our commercial horizon will be enlarged, and there are signs that those in authority are taking measures to cope with the new situation by dealing more sympathetically with commercial wants and interests than they have hitherto done, and a fuller volume of trade will do much towards making good the losses of war, while it will serve to give comfortable employment to a greater proportion of the population than heretofore.

Experts have predicted that we shall go through three stages after the war; firstly, a period of serious dislocation of trade, causing much unemployment and lasting for several months; secondly, a period of great trade activity, lasting for some years; and, lastly, a long period of trade depression. As to the first, it will largely depend on the rate at which demobilisation takes place, and the preparation, or want of preparation, which is now made for the coming of peace. If, as has been wisely urged in many quarters, housing and other necessary building schemes which have been kept back by the war are prepared and thought out, the building industry can absorb a great deal of labour directly it is released, while similar preparation in commercial fields will enable us to avail ourselves of the orders which will be ours if we are ready in connection with the restoration of the devastated districts in Europe. In fact, wise organisation will enable us to escape the danger of the Caudine Forks which may lie between us and the period of commercial prosperity which will inevitably follow.

It is to be hoped that our manufacturers will have learnt by experience, and will not, as they have frequently done in the past, lose markets by a failure to study the wants and habits of foreign peoples, and, if we cannot escape the recurrent periods of boom and depression which seem to mark modern industrial development, the wise co-operation between groups of industries can very largely modify their incidence, rendering it less acute. But every agency, public and private, will be needed to make up the housing deficiency and to provide the new factories and works which will be necessitated on the advent of peace, and legislation may be necessary to sweep away some of the artificial barriers which have restricted the output of capital in building enterprises.

In view of the enormous changes which are likely to take place, one factor ought to be borne in mind. In the past fifty years we have seen schools built which are now regarded as being unsuitable for modern teaching, hospitals constructed which do not commend themselves to modern science, and railway bridges built too small to permit the use of the most efficient rolling stock. The development of our towns has been so enormous and so little anticipated that both roads and buildings have been constructed which we should like to see altered and enlarged, but which we cannot afford to destroy.

We are at every turn hampered by the results of the deeds of the generations which preceded ours. Warned by past experience we may bear the future sufficiently in mind, and not allow our successors to suffer for our own want of imagination. Recently in drawing attention to the existence of slums in Scotch towns an authority regretted that the leasehold system was almost unknown in Scotland, because, while English slums disappeared automatically, the slums of Scotch towns remain, as they were solidly built. We think there is room in many districts, not for jerry-building, but for buildings meant to last for a limited period only, because future requirements may differ largely from our own, and we believe that this should be borne in mind and provided for in the building by-laws of specified areas and districts.

We have dwelt on the future largely to the exclusion of the immediate past, since, with the exception of the final stage of the Board of Trade Competition, the competition held for the Replanning of Central Bradford, and a few other projects the carrying out of which is postponed for the term of the war, building has been confined to a number of commercial premises and private works owing to the withholding of the usual grants and the shortage of labour in the building trades due to enlistment and the various munition and other works necessary to the prosecution of the war. All that can be done at present is to make every preparation for the resumption of full activities in building and its attendant industries, as it must be one of the first great callings to be needed by the community with the return to normal conditions, which we trust may not be very long delayed.

FLANDERS AND BRABANT.

PHILIP the Bold, Duke of Burgundy, acquired a wedding portion already enriched by architecture when late in the fourteenth century he annexed the province of Flanders through matrimony. When this inheritance again passed, on the marriage of Mary, the beautiful child of Charles the Bold, to Maximilian of Hapsburg, after the lapse of the fifteenth century, its architectural splendour had become considerably increased in the hey-day of mediæval art. Architecture and all the decorative arts, and a wonderful school of painting, illustrated both the splendour of the province and of the dynasty. The glories of Flanders culminated in the birth of Charles V., afterwards Emperor, at Ghent in 1500, paled in the miseries of the Spanish Terror at Antwerp in 1566, under his son, Philip II., and passed away gradually, with their designation as the Spanish and Austrian Netherlands, to enter modern times with a measure of revival in the modern Kingdom of Belgium.

The Town Halls of Flanders and Brabant belonging to the fifteenth century form a most significant group of monuments. They bear witness to the vigorous independence and wealth of their municipalities, as well as to the power of Gothic architecture in the civil sphere. Their historic witness to sturdy civic life, as well as to that of artistic and intellectual power, compares remarkably with that of the cities of the Duchies and Republics of Northern Italy at this same period of the Cinquecento; they lay respectively at the northern and southern limits of the Holy Roman Empire, with the integrity and polity of which they were both more or less concerned, but of which neither supplied a constituent. Until the primacy passed to France in the succeeding era the Flemings and the Florentines, among the European peoples, led the movements of intellectualism and art. The Renaissance illuminated both alternately and in combination; it may be said that the poles of its revolution lay in Flanders and Tuscany, and it is certain that their arts and sciences have more permanent importance than the furtive political *jeu de paume* between the Emperor and the Pope which fills the historian's perspective.

The Netherlands are but reminiscent of the discomforts of Erasmus at Louvain, though the influence of his intellect diffused itself throughout Europe; they still, however, retain amidst their original associations some of the works of the primitive and Early Flemish painters, though most are gathered into galleries at Brussels and Antwerp, and a representative sprinkling gives interest to many foreign collections; but the architectural art of the Flemings is necessarily rooted in the soil. It is in Flanders and Brabant only that pilgrimage can be paid, and, so long as the exigencies of modern civilisation permit, the architect will derive from these provinces the still vital inspiration of the civic splendour in their unrivalled group of mediæval monuments. Bruges, Ghent, Brussels, Louvain, Ypres, and Courtrai furnish a list of Town Halls and Courts of Justice as consistent in their epoch of the fifteenth century as they are varied in character. The Hôtels de Ville of Louvain and Ghent resemble one another in type, but the variety of all in the group is very marked—the scale is always magnificent, dominating the city as the cathedral does in England; the mass is powerful and concentrated in outline, the detail rich within and without; and the towers and belfries piquant and original in form. This wealth of spontaneous freshness, which does not sink into the exaggerated originality of the Renaissance, and the characteristic municipal type, which is never suggestive of the ecclesiastical tradition, as in the secular Gothic of our own land, have afforded especial profit to the English architectural student, who has discerned in these buildings, not only a new virility in Gothic design, but a correspondence to the claims which our modern development of municipal life have imposed upon him.

English civic architecture of the nineteenth century seemed to lie outside the natural bed of the stream of the Gothic Revival. Ecclesiastical life and art, in the accepted nature of things, appeared to transcend that of the commercial market-place and the ideals divided in architectural expression. Arguments with which the vituperative Pugin assailed the habitual Classic architecture did not attach to buildings of secular purpose with any sticking quality; he was more effective in attacking the use of "Pagan" forms for places of Christian worship than in abusing the grandeur of Hardwick's entrance to Euston Station. It is not to be wondered at that the clergy responded more readily than the laity to the Gothic movement, and a dual architectural ideal was for a time accepted. Sir William Tite, the architect of the Royal Exchange, was as content in his day to adopt a Gothic style for the Scotch Church in Regent-square as the Liverpool Cathedral Committee in ours, with belated zeal, has been to stipulate for a Gothic glorification of the city of St. George's Hall. The wealth and increase of ecclesiastical art at home, compared with secular remains, afforded a natural fount for students, and was more easy of translation into practical purposes of a similar nature than of use for civil purposes. Domestic architecture, which in England hankers after Romanticism, employed Gothic from the earliest dawn of the Revival and enjoyed an imagined association with Norman and Plantagenet ancestors in the use of their ornaments and battlements. It was the competition for the Houses of Parliament, the most important edifice in England of the nineteenth century, which first induced the application of serious Gothic to a great secular purpose. The success of the group is really accidental through the reaction of the enforced dignity of the plan upon the mixed elements of the elevation and by aid of the robe of tracery and petty detail which uniformly enriches each of the very diverse elevations. But the source of interest was in its relation to Henry VII.'s Chapel near by, and the building, with all its assumed slavery to historic guise, is without any real English precedent. This is not perhaps to us a matter of regretful comment; it is rather a welcome, because undesigned—evidence of the essential strength of the character of our age in asserting itself through such an elaborate mask. By the time that the New Palace at Westminster was completed Tudor Gothic was thoroughly played out as material for Revival. The patriotic glamour of its peculiarly English phase of Gothic did not avail long; no public building, even of minor importance, was attempted by any leader of the school, and it was left to Sir James Pennethorne, an accomplished Classicist like Barry, to sing the swan-song of modern Perpendicular in building the Record Office on a retired site in Fetter-lane. The subsequent extensions to the important frontage in Chancery-lane by the official architects of the Office of Works, of course, do nothing to redeem the failure of this final experiment in Tudor.

But the devouring energy of the Gothic movement was not to be contented with a monopoly of ecclesiastical or a predominating influence in domestic architecture. The competitions at Manchester—first for the Assize Courts and soon afterwards for the Town Hall—revealed a widening outlook, and a survey of the series of municipal buildings belonging to the era of the Law Courts competition proves not only the defeat of the Italian School of Sir William Tite, but the advent of Continental elements into the civil architecture of the Gothic Revival. If France at this period was contributing new life to our ecclesiastical work, Flanders was inspiring the architects of our civil buildings by its suitably magnificent types. There was a competitive stress between the appeal of such examples of what was proudly known as the universal Classic style, as the Town Halls at Halifax and Leeds and the new expression of Gothic in the municipal buildings at Manchester, Chester, and Northampton. With freedom and adaptability came originality. The opportunity was taken advantage of for secular Gothic towers and Campaniles of a non-ecclesiastical type, for which the Clock Tower at Westminster was not a sufficient inspiration, and we can appreciate the eagerness with which the belfries of Flanders were seized upon, digested, and re-embodied as entirely direct expressions of civic power.

To this epoch belongs the design by Sir Gilbert Scott for the Town Hall at Hamburg, which is reminiscent in its composition of the Great Cloth Hall at Ypres. The design undoubtedly had great influence and probably attracted attention to its prototype. Ypres illustrates mediæval secular architecture on a scale which is unrivalled on the Continent, and embodies elements of dignity more usually attributed to Classic. It has a grand tower, centrally placed, rising from the plane of an immense length of elevation, rendered effective by the symmetrical repetition of traceried windows in the middle story and by a continuous parapet cornice. Gothic without buttresses and with a severe economy of pinnacles was a new and welcome phase which quickly caught the public mind and introduced a much wanted motive of rhythmical breadth into the practice of Gothic. Massive grandeur as at Bruges, richness concentrated as at Ghent and Louvain, and emphasised with a symmetrically-placed tower as at Brussels, all illustrate the wealth of the architectural lessons of the Low Countries to English architects competing for the erection of Hôtels de Ville for the flourishing commercial centres of England.

The tale of examples could be extended with a corresponding list of resultant designs. The requirement at home, the precedent abroad, and the enthusiastic designer were coincident, and we thus possess at home abundant concrete illustration of a real and modern architectural indebtedness to our Belgian ally.

The charms of Flanders have not exhausted themselves with the fading of the activity of the Gothic Revival. It is now strangely impossible to imagine a Gothic design winning an important municipal competition; the whirligig of time is so rapid that, while a generation ago nothing but a mediæval County Council Hall could have been a proper pendant for the Houses of Parliament, to us the idea is weirdly belated. But near by is New Scotland-yard—if not Flemish, yet of the Low Countries in its suggestion and waterside charm. The brickwork revival, with which its lamented architect was associated and which happily has not wholly spent itself, is founded both indirectly through its ancient English prototypes and directly through the sketch-books of tourist architects upon the simple fronts which abound in the streets of Flanders. Bruges, Malines, and Ghent are all near at hand, and a short holiday is sufficient to replenish a sketch-book and provide a stock of easily-applied and charming treatments for economical school blocks and of the quaintnesses for which the public have been trained to ask. The lofty churches and famous steeples, such as Antwerp and Malines, have character of their own which perhaps have not directly fed the pencil of the designer, but which are most dear to the artist. Their contents, as a rule, exceed in interest that of the buildings. There is wonderful mediæval woodwork at St. Sauveur, Bruges, and St. Martin, Ypres; Renaissance marble screens, metalwork, and enamelling, as in the tombs of Charles and Mary at Notre-Dame, Bruges—a church which also contains the marble Madonna of Michelangelo. The pulpits are world-famous, and rival one another in realistic fantasy, and, besides, are masterpieces both of technical achievement in sculpture and construction in wood and marble. The sober interests of an archæological parade around the choir of an English cathedral have no comparison with the artistic excitements of the tour round churches like St. Bavon, Ghent, or St. Sauveur, Bruges. The wealth of mediæval painting at the former is represented by Van Eyck's Paradise Triptych, and the masterly Renaissance screens and organ at the latter are memorable and typical of the wealth of the Spanish era. The glories of the later school of Rubens and the grandeur of scale of the Renaissance churches of the seventeenth and eighteenth centuries belong, of course, to Antwerp, Malines, and Ghent, and probably rise to every artist's mind instinctively as first in especial recollection.

The potent influence which the municipal buildings of Flanders have exercised over our own architecture in recent years was ephemeral, but the many charms of Flemish art remain powerful, varied, and constant. The surge of war is now over the provinces, destroying and sparing in its unreasoning fits of fury, making dreadful history upon its buildings under our eyes. These monuments have been the artistic inheritance of European civilisation as a whole, but as a whole it has manifestly lacked the power to prevent their danger or destruction. The success of the Allied Armies, the speedy reoccupation of Flanders and Brabant, and their restoration to their rightful ownership afford the only hope for the preservation of what remains to us of their marvellous buildings and works of art, and its early achievement is the prayer of all lovers of the unique inheritance of these provinces.

NOTES.

A Fortunate Discovery. SOME two years ago the Society of Dilettanti presented to various institutions spare copies of steel plates from the folio volumes in which they had from 1769 to 1840 published the results of the Ionian expeditions sent out by the Society; but, having disposed of their stores, they came upon a parcel which contained original drawings of architectural subjects, together with proof engravings from nearly sixty plates. As these were supposed to be plates from published volumes, the Society offered them to the Royal Institute of British Architects, and the plates and engravings were exhibited in the rooms of the Institute in 1913. While they were on exhibition Professor Lethaby discovered that the plates, though engraved as long ago as 1830, had never been published, and the discovery was communicated to the Society of Dilettanti, a search through whose archives revealed the fact that these drawings, made by the members of the Second Ionian Mission in 1811, were to have been published as a companion volume to Part III. of the "Antiquities of Ionia," which was issued in 1840. The project was apparently delayed by the death of William Wilkins, R.A., who acted as architectural expert to the Society, and was also editor of the work. The plates have been fortunately rediscovered, and are to be issued in book form, Professor Lethaby being the editor. The new volume will be known as Part V., being a supplement to Part III., and will deal with the great temple of Artemis at Magnesia, and with monuments at Myra and other Lycian cities. It will probably be published in February.

The Arrangement of the Victoria and Albert Museum. A LETTER to the *Times* calls attention to the fact that the necessity for moving original and costly specimens of metalwork to secure parts of the museum has made the collections which remain more attractive and of greater educational value, the collections on view not being overweighed with duplicates, triplicates, and trifling originals. The writer says that the range of historical illustration of goldsmiths' and silversmiths' art is wider than hitherto and more in evidence, including Greek work dating from 1500 to 1000 B.C. to mediæval and Renaissance examples. All the objects are reproductions, facsimiles of originals belonging to other countries, which could be replaced if destroyed. The writer very reasonably suggests that, as the object of the South Kensington Museum is an educational one, good copies are of infinitely more value than poorer originals, and that a similar process of revision and rearrangement might profitably be carried out by the authorities during the war. The suggestion is an admirable one, and will, we hope, be considered by the authorities. We might add that the model of Wren's first design for St. Paul's, of which we give photographs in this issue, should be repaired and placed in a suitable position in South Kensington, since it probably has more interest to Englishmen than any architectural exhibit in the Museum, while it can only be examined with difficulty in its present obscure position.

Inspectors of Munitions. WE notice that questions have been asked in Parliament as to the qualification of those engaged by the Government to act as inspectors of munitions, and that considerable astonishment and some dissatisfaction were expressed at the result of the inquiry. It is not to be wondered at perhaps that the Government were unable to agree to lay down any hard-and-fast line on this question. There is a sense in which it may be said that the greater part of our national efforts are being carried on by amateurs or by men hastily trained for this special work. It is obvious that the Government must have a free hand to avail themselves of the services of teachable men, whatever their antecedents may have been. But we think we are right in saying that in such matters as the inspection of munitions, and the finer and more accurate work connected with their production, it has been found that men of superior education and quickness and delicacy of perception are better in many important respects than those who have spent their lives in the usual routine of mechanical production. If the Government require the services of such men they cannot do better than engage those architects whose work they have stopped by direct administrative action. Architects are accustomed to work to scale and have an appreciation of accuracy, and should, we think, be found more suitable for this work than most other men of equal education.

Stonehenge. THE local Secretary for Wilts of the Society of Antiquities writes to the *Times* on the subject of Stonehenge. Any other Government, he says, but an English one would have seized the late opportunity of acquiring it. The writer is probably right as to this, since smaller Druidical monuments in Brittany have the inscription "Property of the State" affixed to them, but we question whether Stonehenge would be safer if it were so protected. Under the present law we believe the stones cannot be removed or used as in past ages for building material, and it hardly seems if this is so that they are exposed to any other dangers than those of time and the effects of weather. There are no mouldings or carvings to be damaged, and the worst that can happen is that a few may scratch their initials on one of the monoliths. We are naturally glad that it is not within the power of anyone to use them as building material as they were used in former centuries, but we think it may in this case be possible to carry antiquarian zeal and enthusiasm somewhat too far.

LEON BATTISTA ALBERTI AT RIMINI.

The little town of Rimini* on the Adriatic, one of the five towns of the ancient "Pentapolis Maritama," is open, brisk, and healthful to the traveller, offering a pleasant contrast at some seasons to the more marshy climate of Ravenna, and recalling the liveliness of Treviso or Pavia. Like its sister towns of Fano, Pesaro, Sinigallia, and Ancona, it is of Roman foundation, and, while its massive arch of Augustus is of capital importance as a relic, it also possesses the rare privilege of a well-preserved Roman bridge, spanning the River Marecchia on the north side of the town. Bridge and arch are in association, but at opposite ends of the Via Augusto, so that we have, in effect, a veritable Roman way.

In its Cathedral of San Francesco, however, Rimini possesses another monument of much greater significance in the history of Art. It is in the centre of the town, and can be approached direct, but the force of contrast is greater if one turns aside to it from the principal street and spies it suddenly at an angle, looking for all the world like a third Roman fragment, but grander and more impressive than either of the others. Here we are in the heart of the Rimini of the early and middle *Quattrocento*, which belonged body and soul to the fiercely vivid family of the Malatesta. Their house, the Castel' Malatesta, is to be found on the walls at the west of the town, but modern military necessities have obscured its original purpose; it is San Francesco, cathedral and monument in one, that is stamped all over with the personality of the greatest of their race—that Sigismondo Pandolfo Malatesta who patronised art and learning, but turned aside at times in a white heat of passion to make the streets of the town run with blood.

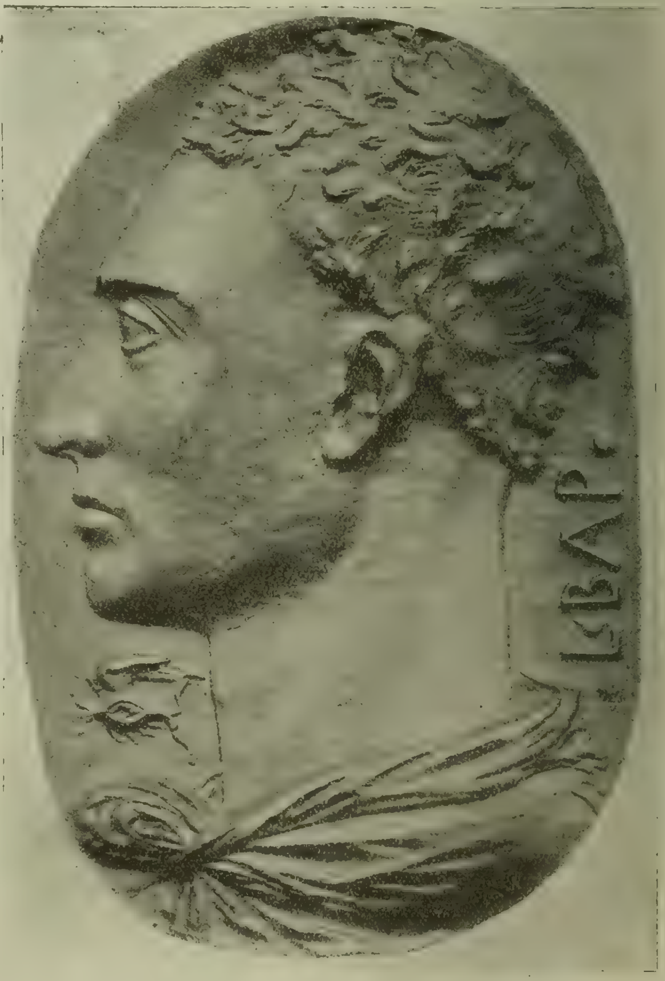
If there is perhaps no association of town and despot more vivid to us than that of Rimini and the Malatesta, immortalised in Dante's vision, there is certainly no happier relic of those fierce times of emperor, pope, and *condottiere* than the barn-like thirteenth-century church, transformed by the genius of Leon Battista Alberti into a notable monument of the Renaissance. Alberti was an outstanding giant in the early time of the new classical outlook, and this church is one of his greatest works. On account of it, and of three other later works—the façade of Sta Maria Novella at Florence, the Palazzo Rucellai at Florence, and the church of Sant' Andrea at Mantua—the scholar of noble family and author of a learned treatise on architecture who was responsible for them is alive to us as an architect combining those rarest of qualifications—large grasp and extreme refinement. Further, if we had to choose one work of them all by which to compare him with his fellows, it would probably be the church at Rimini.

Alberti takes his place in the history of the Italian Renaissance as the third great pioneer in architecture. Born in 1405, twenty-six years after the advent of Brunelleschi, he lived till 1472, or three years before the birth of Michelangelo, and his career thus spanned a most important part of the fifteenth century. He was at his prime in the very middle of that epoch, beginning his work at San Francesco apparently about 1446—the year of Brunelleschi's death and a few years before the birth of the elder Antonio and Giuliano da San Gallo. Bramante was born in 1444, so that, broadly speaking, we see two great periods defining themselves—the first represented by Brunelleschi, Michelozzi, and Alberti; the second by Bramante, the San Gallo, and Cronaca. Yet a third and culminating period is identified with architects to whom the foregoing were leaders, conspicuous among whom were Peruzzi, Sanmichele, Sansovino, Michelangelo, Raphael, and Giulio Romano. With regard to Alberti, in the twenty odd years that elapsed between the rebuilding of San Francesco and the erection of Sant' Andrea at Mantua, the delicate pilaster style which he himself inaugurated at the Palazzo Rucellai had its day and disappeared, its principal exponent being Bernardo Rossellino, whose career ran curiously parallel with that of Alberti, and who may have begun by working under him at Florence. That Rossellino was a man of ability we can see from his authentic buildings at Pienza, though the extent of his influence outside that town is rather a vexed question. With this possible exception, Alberti appears to have founded no direct school,* just as he owed very little to the work of his immediate predecessors.

His most mature work—Sant' Andrea at Mantua, which was uncompleted at his death—may well have exercised a profound influence on later church buildings. The whole conception of the plan and structural form of this great church, which was more than 110 yds. long inside, stamp it as the work of a man who was master of his art, who was accustomed to think in a large way, and who was a constructor as well as a theorist. The broad pier treatment of the Mantuan church, with its recessed chapels and coffered barrel vault over the nave, got right away from the columnar basilican plans produced by Brunelleschi at San Spirito and San Lorenzo at Florence; while its great porch, well over 100 ft. wide, anticipated the mature work of Bramante as well as the soaring creations of Michelangelo. Alberti's line of development was not so much that of the early Christian basilican churches as the more important Roman buildings with their vaulted ceilings carried on massive structure.

Such an output of work as Alberti's, though limited, is sufficient to stamp a man as pre-eminent. Architects can claim him for their confraternity as one of the foremost even in an age of splendid building. Is it more amazing, or less, that we find the man behind this work almost comparable to Leonardo in versatility, of magnificent physical gifts, a profound student of law, music, and mathematics, taking to architecture, in fact, only when his health broke down? We are not really concerned with the answer, since his building work was of such enduring quality. For that we are content to take him as he stands, yet he must be given a prominent place in any survey of the Italian Renaissance in the widest meaning of that great time. In the finest medallion portrait* we have of him, with its nobly-proportioned head, its eager sensitive face, we seem to see one of the most princely personages of any age.

It has been said already that San Francesco at Rimini is a monument as well as a church. This is so in fact, as, besides being constructed in honour of Almighty God, it is a veritable casket containing not only the structural relics of the earlier church, but of all that Sigismondo Malatesta could possibly do to assure future ages of his existence. The exterior, which is of marble, is uncompleted at the east end, but Alberti evidently intended to make an entire building of it. The façade exists, as well as the side walls, 6 ft. thick, which cover the Gothic walls, and are pierced with round-arched openings to suit the earlier windows, the lines of the main entablature and base being continuous, so that the remodelling is no mere elaborate frontispiece and plain building behind, but a homogeneous creation. These openings,



Leon Battista Alberti.

From a cast in the British Museum of the original medal in the Dreyfus Collection.

(By kind permission of Messrs. Duckworth & Co.)

---

* At the time of writing dangerously liable to Austrian attacks by sea or air.

* His connection with Rossellino is a matter of interest. Perhaps Alberti may have designed some buildings which Rossellino carried out. A passage in Vasari seems to suggest as much, though Vasari appears to belittle unduly Alberti's constructive ability.

* There is a cast of this in the British Museum, the original being in the Dreyfus Collection. Mr. G. F. Hill, following Heiss, considers it was probably executed by Alberti himself. (See Hill's "Pisanello"—Duckworth.) The writer's acknowledgments are due to Mr. Hill and to Messrs. Duckworth for the reproduction.

on the south side, contain sarcophagi—a device, whether of patron or designer, which embodies a fine idea and emphasises by a master-stroke the whole meaning of the restored edifice. What, indeed, could be more complete in every sense than this recurring potency of monument thus associated with the structure of the whole? One of the sarcophagi contains the bones of an ancient scholar of renown, brought back reverently from foreign lands by Sigismondo.[*]

The façade conforms to the prevailing type employed, both in earlier and later work in Italy, the ultimate Renaissance version being fully foreshadowed by Alberti at Sta Maria Novella.[†] Here simple straight slopes at the aisle roofs take the place of the scroll-like endings of the Florentine church. The upper structure of the front is incomplete, but the intention of the designer becomes clear if we study the commemorative medal of Matteo de' Pasti, struck in 1450.[‡] Pasti, besides being an accomplished medallist, seems to have been a useful man in other respects. We gather that he and some others acted as assistants or clerks of the works to Alberti, and may have materially assisted him with the execution of the design.[§] The medal was made with such nicety and attention to detail, and is so accurate in its representation of the lower part of the building, that we can safely accept its accuracy for the whole without question. We learn, therefore, that the roofs of the aisles were to be finished with bow-curves, and that the existing recessed imposts of the crowning central feature carried a semicircular arch, and above that a pediment. We should have inferred this finish from the analogies of both Sta Maria Novella and Sant' Andrea. The dome which overtops the pediment in the medal was evidently intended by Alberti over the crossing.

In its general impression the façade as it exists to-day is so big, so simple, and so grand that one hardly realises it is just that of an ordinary Italian church of rather more than average size, with 6 ft. or so tacked on at each side for the thickness of the new walls. In his fine use of the applied columns Alberti may have been working on the idea of the Roman archway in the town,[||] and one can see a reminder of its circular-framed spandrel busts in the stalwart wreaths of the spandrels of the church façade, which are repeated on the sides at about the same level. At any rate, the front is certainly Roman in spirit, with a new importation of thoughtful, caressing, lavish detail. One feels that in England no one could have done such a front but Inigo Jones, perhaps no one in Italy but Alberti. There is, indeed, a similarity in the work of the two men. The wealth of beautiful design in the carving of the podium at San Francesco reminds one of the balustrade reliefs at Pergamos, but the masculine detail of the column caps, the vigour of the mouldings, and the fine treatment of the great doors are characteristic of the English master.

The exterior of San Francesco would alone render it one of the most interesting pieces of work in Italy, but there is also, fortunately, a remodelled interior for which Alberti must be held responsible. Here the problem was difficult, as without entire reconstruction the Gothic character of the original structure was bound to be more insistent. It was allowed to remain of necessity, but was so lavishly classicised that on entering it is at once apparent that one is inside a Renaissance temple and not a mediæval church. The hand of a master is evident, however. By means of a rich and practically continuous line of high railing to the chapels, and a frieze-band above the pointed arches—both associated at the east end with the round-arched opening to the sanctuary—base and horizontality are given to the delicate Renaissance trappings on pier and wall, which are added with infinite skill. Large romanised capitals are inserted at the imposts, but they are tempered by the finely broken-up panelled piers and a wreathed decoration in the spandrels which makes them throb with life. The pilasters on the main piers forming the lower order are completely elegant and full of proportion to their surroundings. The upper pilaster treatment is worthy of Brunelleschi at his best, and one need say no more. There is not only an unswerving sense of scale and a mastery of graceful detail in all this, but the evidence throughout of a large and daring mind.

Noticeable features are the detail of the altar railings, crowded with marble colonnettes—the braggadocio of the donor, whose name is carved large on every arch with the inscription that he, "Sigismondo Malatesta, did this"; while the little side doors with low relief marble medallions and panels are as fine *Quattrocento* work as any existing. The greater part of the carving and sculpture work throughout is of the very finest quality, colour being freely introduced after the manner of the Della Robbia. To quote Symonds:—"Allegorical figures designed with the purity of outline we admire in Botticelli, draperies that Burne-Jones might copy, troops of singing boys in the manner of Donatello, great angels traced upon the stone so delicately that they seem to be rather drawn than sculptured, statuettes in inches, personifications of all arts and sciences alternating with half-bestial shapes of satyrs and sea-children—such are the forms that fill the spaces of the chapel walls, and climb the pilasters, and fret the arches in such abundance that had the whole church been finished as it was designed it would have presented one splendid, though bizarre, effect of incrustation." The work certainly deserves the most careful study for itself, apart from fuller investigation as to authorship. It is said that Ciuffagni and Agostino Antonio di Duccio, of Florence, took an active part in it.[*]

The theory that Alberti himself had no part in the decoration of the interior[†] is a narrow one, and from external evidence alone appears to be quite contrary to fact. Apart from the architectonic grip of the interior, it is clear, from what we know about the man, that he would take ascendancy over others in any design with which he was associated. Between 1446 and 1461 he must have been often, though not constantly, in Rimini, and his fertile brain would have conceived not only such essential design as exists, but the entire remodelled structure. It is, of course, possible that he ultimately intended to cloak completely the Gothic structure of the interior, even to the extent of rounding the pointed arches; and by running a barrel vault through the whole length of the structure, pierced by transepts and a dome at the crossing, make an entire Renaissance church of it. We are certainly told that he made a model, whether or not this showed the construction of the interior.

The church, however, was never completed. Sigismondo Malatesta, who died in 1468, appears to have got into difficulties about it in 1461,[‡] and for some years previous to that date the work evidently proceeded slowly. We are therefore left with a fragment, stamped outside with classic fervour and inside with the spirit of the *Quattrocento*. In the field of mediæval classicism Alberti obtained a different result in the great west front of Sta Maria Novella, but he was Roman in his outlook, though the work in the interior of San Francesco may have influenced the strange and beautiful ecclecticism practised after his day in Lombardy—seen to perfection in the lower part of the Certosa at Pavia, and in Sta Maria della Grazie at Milan. He certainly had his reward in achieving, in Sant' Andrea, Mantua, a greater conception of interior than the Lombard churches ever arrived at. In the Palazzo Rucellai he was working to more rigid conditions, which had been laid down, partly, by his predecessors. The "Tempio della Malatesta" is less bound by stereotyped lines, and if it does not constitute such a great creative whole as Sant' Andrea, enough may have been said to show that it should be a pilgrimage church to the student.

Our portfolios are overhauling the monuments of the past, but so far it has not been the fortune of the writer to have seen any studies of this church. It can only be hoped that if it escapes the havoc of war we shall see, in time, a fine illustrated monograph of it by a British student. THEODORE FYFE.

[⁂ Some of the photographs which we give in connection with this article were taken by Mr. Fyfe.—ED.]

◆

THE LONDON CHURCHES OF WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

IT was fortunate that the Great Fire of London did not occur at an earlier date, for, instead of the world-famed group of Renaissance churches built by a great genius, we might have had a number of tentative hybrid efforts like the church of St. Katherine Cree, which, though interesting historically and archæologically, would have been in no sense so great a contribution to our architectural history, and probably would not have been marked by the sense of proportion and dignity which distinguishes the "Gothic" churches of St. Michael, Cornhill, St. Mary, Aldermanbury, and the spire and tower of St. Dunstan-in-the-East, poor as those works are beside the Renaissance churches of Wren. Great epochs in architectural history are frequently short-lived, and, although the scholarship of the Renaissance was better understood in later ages than in the time of Wren, we feel as we examine the work of even those men who came under the immediate influence of the master that the incomparable mastery of form and mass possessed by him was feebly echoed in the work of Gibb, Vanbrugh, Archer, and the lesser men who followed. Wren possessed a magnificent sanity of mental outlook, of which we find little evidence in such churches as St George's-in-the-East, St. Anne, Limehouse, or St. Paul, Deptford; while St. Martin-in-the-Fields, St. Giles-in-the-Fields, and St. Mary-le-Strand form an intermediate group finer than what was to follow, but less poetic and resourceful than the work which had preceded them.

Wren, like other of the great men of architectural history, was not uniformly successful, and, while he gave us the steeples of St. Mary-le-Bow and St. Bride, combined them with dull and tame interiors; yet there is hardly a church which he built which either from the beauty of its interior design or external treatment

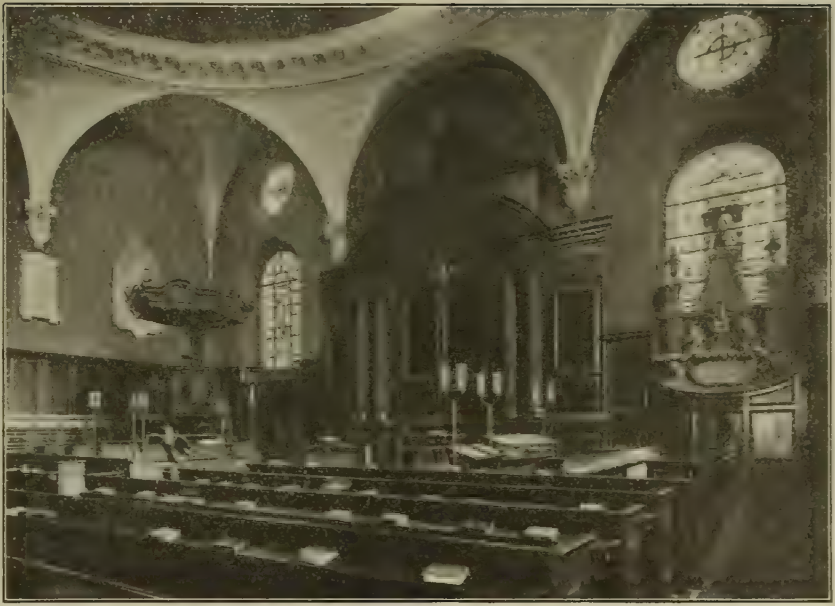
St. Mary Abchurch.



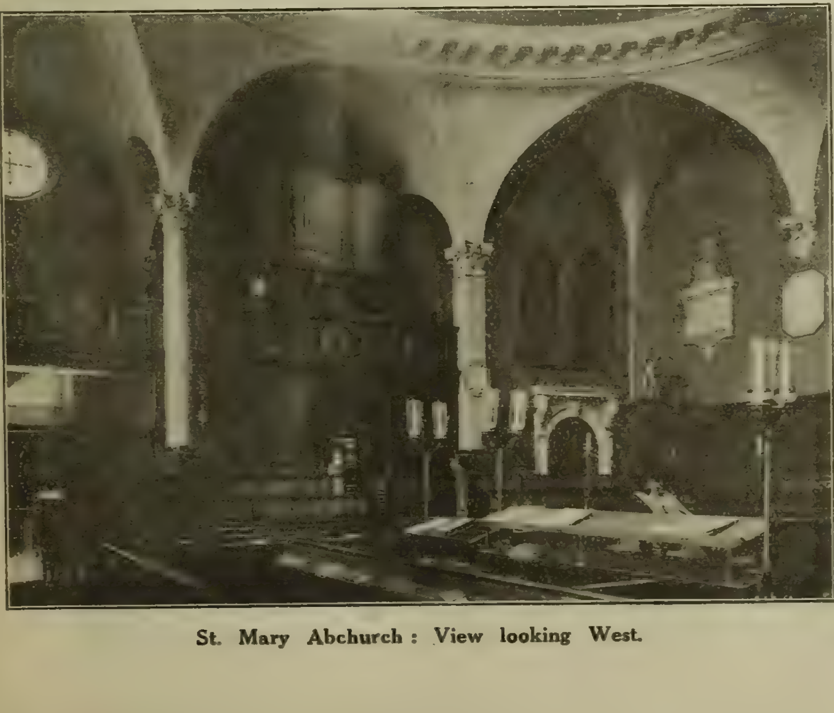
St. Mary Abchurch: View looking East.

does not charm the lover of architecture and appeal to the instinct of beauty which most of us possess. No great architect in this or any other country so fully considered economy of materials and construction; we feel he might have been constrained by an economical employer, whereas his work is the outcome of a nature at once gifted and modest, one who seems to have felt it his duty to obtain the best possible result in the simplest and most economical manner, in striking contrast to many of his foreign contemporaries, who freely divorced themselves from practical requirements in their indulgence of their æsthetic conceptions. Occasional lapses from a standard of good taste are what only can be expected from one who acquired his architectural knowledge late in life, and who gave us the astonishing variety displayed in Wren's erections. Hidden away among masses of houses, in cramped positions and restricted sites among narrow lanes, the greatest of English architects always contrived what has given to a city more immense than he ever dreamed of its abiding charm and interest. So the churches of London form museums where we can study the story of the English Renaissance, sanctified by the memorials of the dead who in their generation have helped to build up the nation of to-day, and it is to be hoped that their stones will remain monuments too precious to be sacrificed for improvements or for commercial gain. We shall, in the following months, give a short description of each church, illustrated by sketch plans, showing the surroundings, sketches of the towers and steeples, and, as far as possible, by photographs of the interiors or in some cases of portions of external or internal detail.

No. I.—St. Mary Abchurch.

The church of St. Mary Abchurch is situated in Abchurch-lane, near to its southern end in Cannon-street, and closely surrounded by adjoining buildings except on the side which faces Abchurch-yard, which was originally the burying-ground of the church, its boundaries being still marked by posts.

The advowson of the rectory of the former church belonged in ancient times to St. Mary Overy, Southwark, but at a later date was bestowed by Queen Elizabeth on the Master and Fellows of Corpus Christi College, Cambridge, in whose gift the living has since remained. After the Fire the neighbouring church of St. Lawrence Poultney was not rebuilt, and its parish was united with that of St. Mary Abchurch.

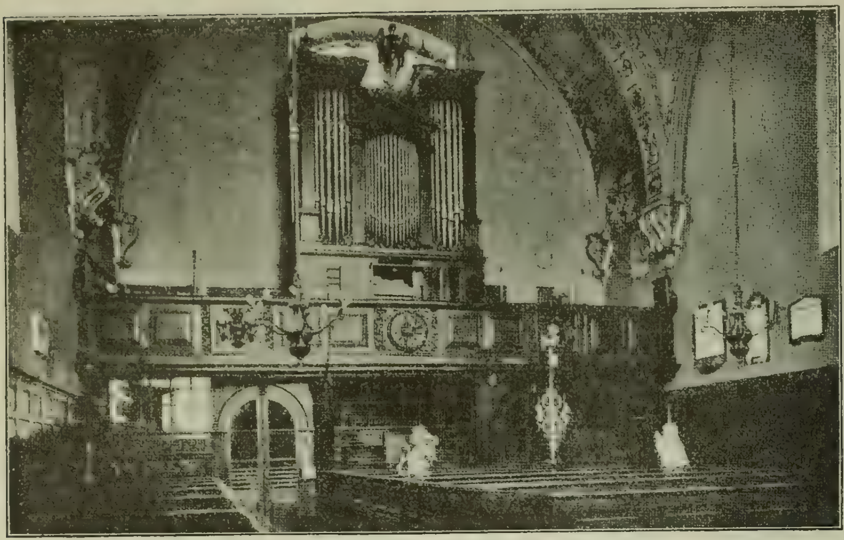


St. Mary Abchurch: View looking West.

The present church was rebuilt by Wren in 1686, and is among the smaller City churches, covering a space of a little over 60 ft. in each direction. The external treatment is simple, no attempt being made to obtain architectural effect or even symmetry, everything but the tower which closes the narrow vista of Sherborne-lane being absolutely utilitarian in character. The tower, with its curious ogee roof surmounted by a spire, is not among Wren's happiest efforts; but, on the other hand, the interior is one of the richest and most beautiful of London churches. The organ gallery, altar-piece, pulpit, pews, and door-cases are unusually rich and beautiful examples of design, and there is much admirable carved work by Grinling Gibbons. The font, which stands beneath the gallery, is surmounted by a carved oak cover with figures of the four evangelists; the pews in the westernmost of the centre block display the City arms, and the Corporation pews against the west end have elaborate sword rests. The high pews along the north and south walls are an unusual and picturesque feature. Among many monuments is one to Sir Patience Ward, a noted politician and Member for the City of London in the Convention Parliament of 1688-89, while another elaborate monument is that of Edward Sherwood.

The dome was painted by Sir John Thornhill, and its dark colour, combined with the deep red walls and painted glass, somewhat detract from the effect of an interior which would bear ampler lighting and a more subdued scheme of decoration. The treatment of the interior, with its dome resting on plaster pendentives, is extremely happy; the whole giving an idea of spaciousness and warm richness which render it one of the most successful of Wren's interior designs.

The manner in which the internal setting out is effected is very characteristic of the period, forming a middle stage between the irregularity of mediæval days and the exact accuracy of a later date. Wren, as in most of his smaller churches, showed his disregard of right angles. None of the outer walls, which probably mark former boundaries, are at right angles to one another. Nor is the central space reduced to a square, and, in addition, the dome is not centrally spaced between the north and south walls, so that the pendentives have unequal projections. The angle of the tower is marked by a pilaster, the corresponding support being formed, as at St. Swithin, by a single free-standing column, the windows cut into the bays between the pendentives without regard for exact centre lines. But the most unfortunate feature is the treatment of the pendentives next each angle, which form an awkward mitre where they intersect



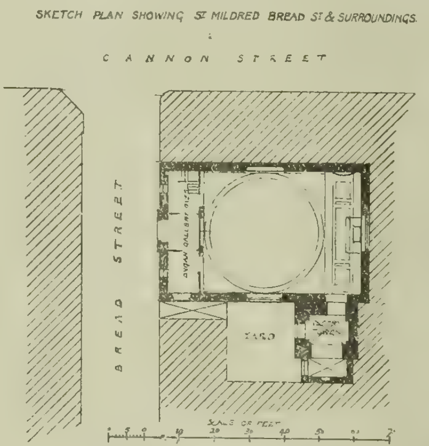
St. Mildred, Bread-Street: View looking West.

causing distortion from many points of view, which are minor defects in a conception of great beauty and imagination.

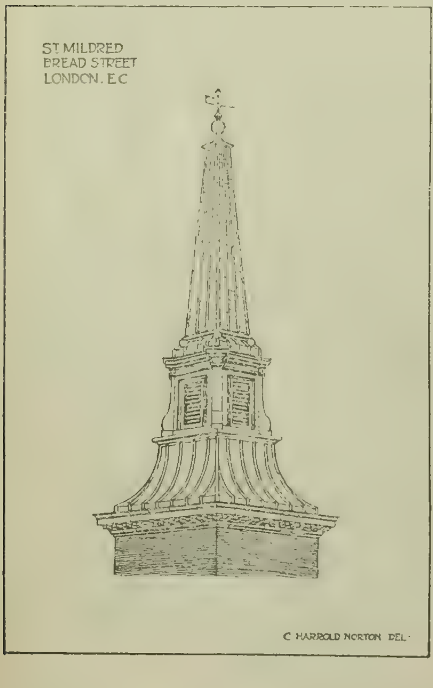
No. II.—St. Mildred, Bread-Street.

The church of St. Mildred, Bread-street, with St. Mary Abchurch and St. Swithin, form a group in which a dome or lantern covers most of the area of the church, while in a second group, to which St. Mary-at-Hill, St. Martin, Ludgate, and St. Anne's and St. Agnes, Aldersgate, belong, the plan consists of four columns with a centre feature consisting of a dome or groined crossing. St. Stephen, Walbrook, stands alone, as in it the same idea is carried out on a much more extensive scale.

St. Mildred is hemmed in by lofty buildings, which, in conjunction with the narrowness of Bread-street, prevent its slender lead-covered steeple, set back over the vestry, from being visible except from the upper parts of adjoining buildings. The front to Bread-street, though symmetrical and architectural, possesses no special points of interest. The interior is one of the most beautiful of all Wren's churches, and, if it shows less invention than St. Mary Abchurch, is characterised by greater refinement and finish. The rectangular plan is divided into three compartments, a central domed space resting on pendentives, and a bay at either end covered by an arched and panelled ceiling. In the centre of each face was a segmental headed window, three of which remain, that in the north wall having been blocked up; the east window opening is filled with stained glass, presented by the Rector, the Rev. Canon Adam Glendenning Nash, M.A., and his brother, Prebendary J. Glendenning Nash, and representing the Ascension. The window is excellent in character, and a refreshing contrast to many of the windows which destroy the harmony and character of Wren's other churches.



St. Mildred, Bread-Street.



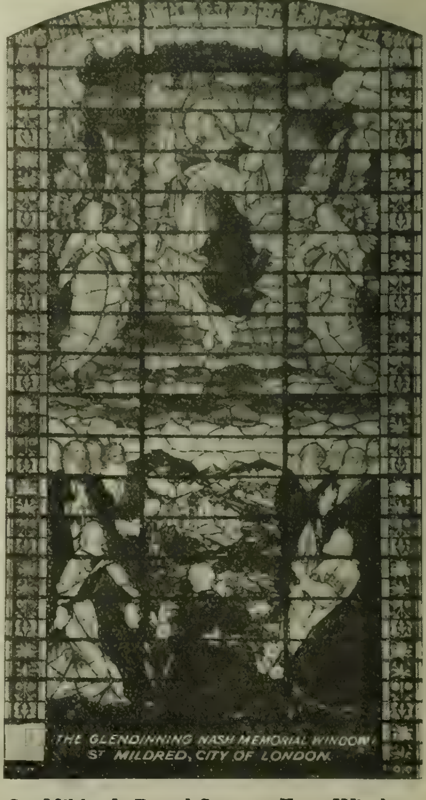
The pews remain in their original condition, and with the pulpit and organ gallery are among the finest examples of contemporary woodwork. Unlike many of the City churches, while the fabric has been carefully preserved, nothing has been done which destroys or obliterates the beauty of the design. It is frequently suggested by many writers that various City churches, especially St. Stephen, Walbrook, were "studies for St. Paul's," but consideration of the different nature of the problem set will make this seem an impossibility. Wren's churches are simple and small, depending for the most part on arrangements of single columns; while St. Paul's, like most great buildings, is a composition of piers, vaults, and structural domes. The justly famed interior of St. Stephen, Walbrook, would rather remind us in plan of some of the Spanish and Eastern mosques than any other ecclesiastical structure known to us, and the suggestions made recall the efforts of imagination which see in the vistas of a forest the prototype of the Gothic church rather than the deductions of balanced reason. The vestry contains an exceptionally valuable and beautiful Communion plate, dating back to Edward VI., Elizabeth, and Charles I., and with the very exquisite white marble font and oaken altar-table was fortunately preserved when the former church was burnt down.

The rectory was originally in the gift of the prior and convent of St. Mary Overy, Southwark; but since the days of Henry VIII. the patronage has been in private hands, and in the seventeenth century the advowson was in the gift of the Crispe family, one of whom, Sir Nicholas Crispe, who was knighted for his loyalty after the Restoration, presented the church with Communion flagons and font in Charles I.'s reign. The parish was united with that of St. Margaret, Friday-street, which was not rebuilt after the Fire. The present church of St. Mildred was rebuilt and opened in 1683.

WREN'S FIRST DESIGN FOR ST. PAUL'S.

The success of the greatest men is usually chequered by failures which seem, to them, more important than to a posterity which is ignorant or forgetful of their aims. The works of Wren are the glory of the London which we know and are proud of; but what London might have been had his magnificent plan for its lay-out been accepted we can only partially picture, and the Cathedral Church of St. Paul, which may well be termed the crown and culmination of English architectural achievement, is a success built over the grave of the most cherished hopes and ideals of a great architect. In the glory of what is we fail to imagine adequately what might have been had the opposition of the Commissioners of St. Paul's and Court prejudice been overcome. Only Wren's model remains, together with a few engravings and illustrations, and when the numerous alterations and divergencies from the accepted scheme are remembered, and allowance is made for the fact that the drawings of Wren's age are tentative diagrams, we may be partially able to realise what Wren's favourite design would have gained in the process of execution.

The magnificent and poetic *motif* of a dome ringed round with a number of smaller ones, and the beauty of the geometrical plan, more than counterbalance the skill of the manner in which Wren translated a mediæval plan into a Renaissance equivalent. No effects of light, shade, and form in the existing building could have compared with the variety given by the succession of dome and arched opening of the first design. Wren's genius was, by opposition, deflected into a channel in which it lost its full

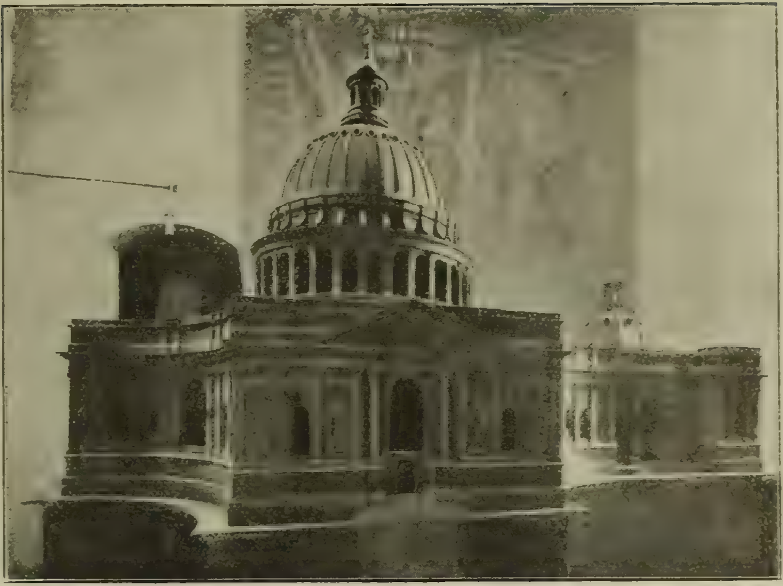


THE GLENDINNING NASH MEMORIAL WINDOW, ST MILDRED, CITY OF LONDON.

St. Mildred, Bread-Street: East Window.

force by restriction of opportunity, with the result that the ingenious devices by which such difficulties as the thrust of the vaults, the discordance between interior and exterior were met, not to mention the structure of the internal and external dome, have become a battle-ground between those who somewhat importunately urge that architecture should be "clothed construction" and others who do not preface a logical defence by the admission that it is preferable to avoid any such expedients without loss of architectural effect. In short, while there is no necessity for an internal and external feature to correspond, we may reasonably be glad that it is possible to make them do so, and in Wren's favourite design this correspondence would have been an exceedingly close one. Many of the criticisms made by those who judge of the scheme from drawings are dispelled by a study of Wren's model. The great dome is set back almost at an equal distance from all faces of the church except the west extension—which may be described as a narthex rather than a nave—and would have been given its full effect. Fergusson alludes to the concave curves which connect nave, transepts, and choir as being disturbing to the repose and quiet grandeur of the building; but the treatment is seen to be justified by the model. The objection to the treatment of the elevation by "plastering it with a series of gigantic and useless Corinthian pilasters" is a criticism which might be applied to the present Cathedral, as well as to many of the great works of ancient Rome and the Renaissance masters, and is hardly germane to the matter under discussion. The point about which most doubt may reasonably be expressed is as to the effect of the second external dome which "surmounts the nave"; but this might have justified itself in actual execution, while it cannot be considered an essential feature of the design which would have been actually carried out, any more than the extraordinary features of the "Warrant" design were. Other critics regret the absence of the campaniles of the first design, but they might well have been developed from the plan in execution, being as much suggested by the plan as by that of the executed design. In fact, if we judge by the difference between the "approved draughts" and actual buildings of the time a great mass of the criticism levelled at this design becomes meaningless, while the broad contention that Wren's judgment in this and other matters would have been justified by results appears to become a reasonable hypothesis. The most practical criticism of the plan, that it was in some ways ill-adapted for its purpose, as the high altar could only be seen from about half the area of the church, is a more serious one, though less so than would have been the case either in past or subsequent ages of the history of the church. The criticism of the exterior treatment of the rejected design, with its one Order and attic, is based, first, on the omission to recognise that whatever may be lost in the substitution of a single Order for the two in the existing building, the former is a logical expression of the interior, while the other is not; and, secondly, in the failure to recognise that the suggested treatment is only a groundwork on which Wren would have worked, probably with a result which would have defied criticism. The criticism that the dome of the rejected design would have been overwhelming in effect raises the question of what our aim should be in the design of a domical church. In Sta Sophia the dome, with its two semi-domes, constitutes the church, yet we do not say it is overwhelming. To a large extent the dome in Wren's first design constitutes the Cathedral, everything else being grouped round it and subordinated to it. It is not a central feature so much as the church itself, and, being so, it may reasonably and properly dominate the whole group to an extent which would be inappropriate in the case of the present dome, which may be termed a central feature marking the crossing. Wren's design in reality forms an intermediate stage between buildings of the type of St. Paul's and St. Peter's, in which the dome is the most important feature, and structures like the Pantheon and Sta Sophia, in which the dome constitutes the building itself, so that criticism which may apply to the typical historical Cathedral of the West becomes inapplicable, and we have to free ourselves from the memory of mediæval precedent before we can judge of the result dispassionately. Lovers of the Renaissance are frequently more influenced by the Gothic traditions in matters of form than they think—a fact which colours our opinions on ecclesiastical architecture.

Apart from this criticism, authorities have generally been in agreement in their recognition



Wren's Model for St. Paul's (First Design).

Wren's First Design for St. Paul's.

that the internal effects of the rejected scheme would have surpassed those of the present Cathedral. It was, in fact, a completer break with mediævalism, and rested on the fuller adoption of the principle of the dome instead of that of the vault as the dominating *motif*. The existing building is a vaulted church with a central dome—a Renaissance version of Ely; while the rejected design departed as far from existing precedents as Wren's City churches do from their mediæval prototypes. Despite the criticisms which have been made by authorities, and with full recognition of the debt we owe to a great genius, we feel that his own individuality pointed the way to the fullest realisation of the full possibilities of the art of architecture employed by a master, and that the epitaph, "Si monumentum requiris circumspice," might have had even greater meaning had it been inscribed in the building of Wren's own choice instead of the existing Cathedral.

◆

HOUSING CONFERENCE AT GLASGOW.

Eight hundred delegates attended the first Scottish National Conference on Housing held in Glasgow on the 3rd inst. under the auspices of the local Labour Party Housing Committee. The Chairman, Mr. William Gallagher, of the Scottish Co-operative Society, characterised the stoppage of the house rent increases as a great victory for working-class solidarity. Dr. Chalmers, Glasgow Medical Officer of Health, said the quickest way to cut down the price of land in the cities was to cut down the height of tenement houses. The time had come when the abolition of the apartment houses should be considered. Councillor Wheatley said the famine in houses in Scotland could be traced in a measure to combines among manufacturers of building materials. Private building enterprise had failed. He outlined a labour scheme for free State house-building grants.

GENERAL NEWS.

Appointment.

Mr. Arthur F. Holden, Deputy City Surveyor and Engineer, Coventry, has been appointed Borough Surveyor and Engineer to the Corporation of Hereford.

Deceased Architect's Estate.

The late Mr. Arthur Rowland Barker, of Grove House, the Green, Southgate, Middlesex, who died on October 26, and was for more than forty years architect and surveyor to the diocese of Winchester, has left estate of the gross value of £27,859.

Collapse of West-End House.

The roof of No. 28, George-street, Hanover-square, a three-story building, fell during a gale a few nights ago, and the whole of the interior of the building down to the ground floor collapsed with the weight of the falling *débris*.

The Surveyors' Institution.

The next ordinary general meeting of the Surveyors' Institution will be held in the Lecture Hall of the Institution on Monday, January 10, when a paper entitled "Some Notes on Reinforced Concrete" will be read by Mr. R. M. Kearns (Fellow). The chair will be taken at five o'clock instead of eight o'clock.

Carpenters' and Joiners' Evening Classes.

A protest against evening classes where carpentry and joinery are taught has been made to the Executive Council of the Amalgamated Society of Carpenters and Joiners by some of the members. They complain that partially-skilled lads and young men use their knowledge gained at these classes to secure work at reduced wages.

The Building Trades, Berlin.

It is stated that the Berlin Chamber of Commerce in its yearly report claims that, except in the building trades, the situation at the end of 1915 is more satisfactory than anybody expected a year ago.

Dominions Offices in the Strand.

We understand that the Governments of New South Wales and South Australia have authorised their respective Agents-General in London to enter into negotiations with the London County Council and the Duchy of Lancaster for the acquisition of a joint lease of certain property in the Strand, near Savoy-street, as a site for Government offices for the two States named. The property referred to adjoins the new offices of the Western Australian Government Agency, and is of an area sufficient to allow of the erection of offices thereon for the accommodation of both the New South Wales and South Australian Agents-General and their staffs.

Art Treasures and Aircraft Raids.

The *Times* understands that the Office of Works recently summoned a conference, which was attended by representatives of the Admiralty and the War Office, and to which the directors of the great museums and art galleries were invited, to consider whether any further steps could be taken to safeguard national monuments against aircraft raids. The naval and military experts present unanimously agreed that no public building could by any structural device be protected against attack by bombs. Steps have, however, been taken to protect as far as possible the chief art treasures of the country. The care of ecclesiastical buildings actually in use was specially excluded from the control of the Office of Works under the Ancient Monuments Consolidation and Amendment Act, and all responsibility devolves on the Dean and Chapter or other ecclesiastical authority.

Steel Huts in the War Zone.

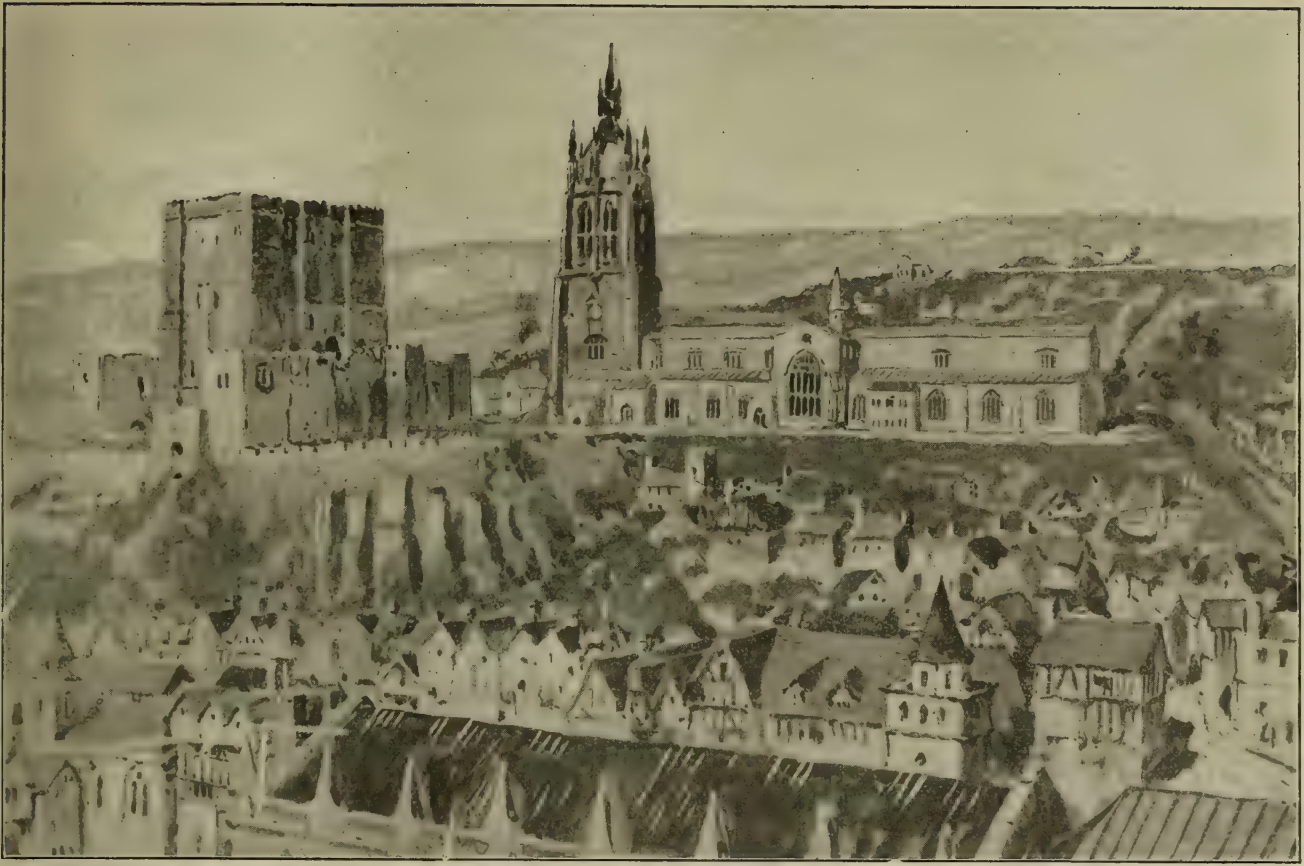
According to American reports the Allied Powers (a report of the British Steel Smelters' Association states) intend to erect vast numbers of portable steel dwelling-houses for the use of the soldiers at the front and also as homes for the inhabitants of territory which has been devastated by the war. It is said that France plans to build 100,000 such dwellings, and other Allied Powers are expected to erect a proportionate number.

Housing Problem, Huddersfield.

The housing problem has become acute at Huddersfield. For some years the rate of building of dwelling-house property has not kept pace with the ordinary increase of population due to the steady growth of industries, and now, in addition to the needs of the other new or expanding industries, provision must be made for the 20,000 or 30,000 workpeople who will be employed by British Dyes, Ltd. The initial efforts of the Huddersfield Corporation to provide working-class dwellings have been almost entirely confined to the substitution of tenement dwellings to make up for the gradual condemnation and closing of the many cellar dwellings. Since the passing of the Housing and Town Planning Act various schemes have been carried out and others have been begun—notably the purchase of the Royds Hall Estate, at Paddock—but their completion has been delayed by the war.

"British Dominions Year-Book."

We have received a copy of the "British Dominions Year-Book, 1916" (1, Royal Exchange-avenue, E.C.), in which we notice several articles of interest, including contributions by Mr. E. Charles Vivian, Mr. Fred T. Jane, Mr. Edgar Crammond, Mr. Edward Salmon, Sir Leo Chiozza Money, Sir Laurence Gomme, Mr. J. Ellis Barker, Mr. H. Massac Buist, Mr. C. G. Grey, Lady St. Helier, and others. Sir Leo Chiozza Money's article shows the opportunity which now presents itself for utilising the resources of the Empire for the benefit of the British people. The "British Dominions Year-Book" is not published in the ordinary way, but will be presented to public and business men and women.



Portion of Model of Old Newcastle.

By Mr. John P. Thorp.

(Presented to the Laing Art Gallery and Museum, Newcastle.)

ILLUSTRATIONS.

Russian Mediæval Architecture.

We give illustrations of one of the historic mediæval churches of Moscow, together with a descriptive article on page 12. The mixture of Asiatic and Byzantine types renders Russian architecture exceedingly interesting, if a little strange to Western standards.

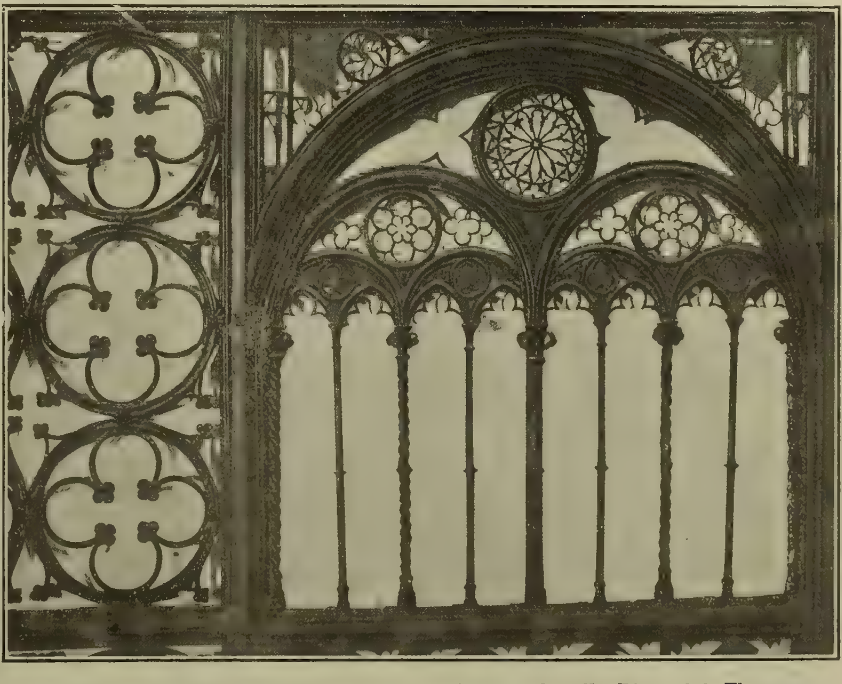
Old Newcastle.

THESE illustrations are from photographs of a portion of a model by Mr. John B. Thorp, of Gray's Inn-road, London, W.C. The model is of Newcastle in the reign of Queen Elizabeth, and shows practically the whole of the town within the city walls. One of the photographs shows the old bridge, and the other the Castle and Cathedral, with the roof of the Customs House in the foreground. The model has been executed to a scale of $\frac{1}{200}$ full size, and has been presented to the Laing Art Gallery and Museum, Newcastle, by Lord Joicey and Mr. John G. Joicey.

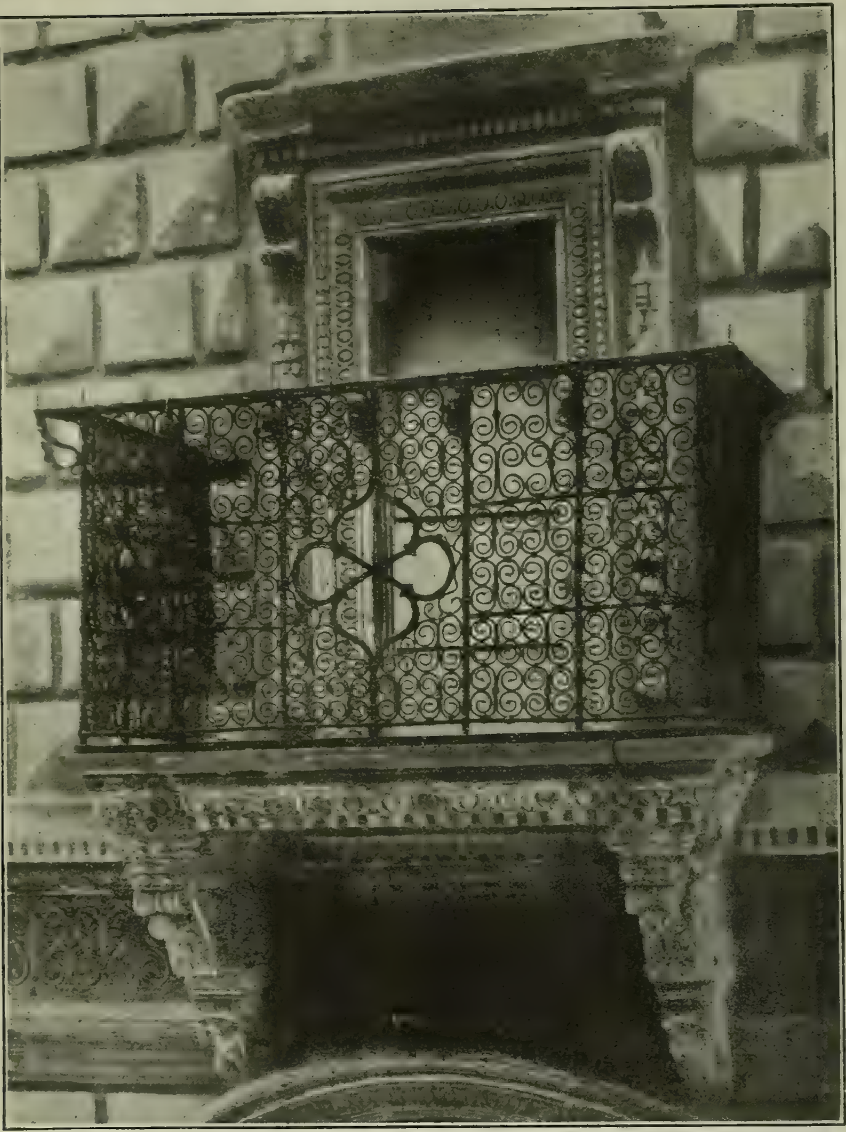
The Emperor Hadrian built the first stone bridge across the Tyne in the year 120. It consisted of stone piers, on which was laid a timber roadway. In 1248 the timber roadway was destroyed by fire and the piers were considerably damaged. The bridge was rebuilt, practically on the same foundations, and finished with stone arches. In 1339 it was very much damaged by floods, and 120 people were drowned. The bridge was covered with houses, as shown in a view dated 1739. The houses not only projected over the bridge, but also encroached upon the roadway. There was only room for goods to go over on packhorses; other modes of transit along the bridge would have been impossible. There were three towers on the bridge—the Gateshead Tower on the south, the Prison Tower near the middle, and the Magazine Tower on the Newcastle side. There was also a chapel on the bridge, mentioned in 1616, called Our Lady's Chapel. The Magazine Gate had a date of 1636 upon it. The bridge, which replaced that of Hadrian, had one great fault: its piers were so wide as to greatly impede the passage of the waters. The bridge originally consisted of twelve arches. When the quays of Newcastle and Gateshead were built three of these were absorbed by the works and the whole body of the waters made to pass through the remaining nine arches.

Old Italian Ironwork.

WE give further illustrations of Italian ironwork, for the greater part of seventeenth and eighteenth century date. Its delicacy and fancy distinguish it from the corresponding work in England and France, while it is usually simpler and less ornate than the work of the Spanish smiths. The want of craftsmanship in smith's work is more needed to-day than in almost any other of the callings connected with building; but, though the revival of



Old Italian Ironwork: Detail of Chancel Screen, Capella Rinuccini, Florence.



Old Italian Ironwork: Balcony, Palazzo Bevilacqua, Bologna. (*See page* 11.)

craftsmanship as a working force appears to be a remote contingency, we have greatly improved on the standards of fifty years ago.

Ocean Marine Insurance Company's Offices.

THE Ocean Marine Insurance Company, Ltd., last year decided to demolish their building in Old Broad-street and to erect the present imposing building. This has been designed by Messrs. Thompson & Walford, of Leadenhall-buildings, E.C., who have given regard to the extreme value of the space here and likewise to the narrowness of the street at this point. It is one of the highest buildings in the City, comprising as it does some ten stories. The façade has Italian granite for the two lowest floors, with bronze enriched openings and Portland stone above.

The building contractors are Messrs. Geo. Trollope & Sons and Colls & Sons, Ltd., Coleman-street, E.C., and the clerk of works is Mr. F. Thomas. The following is a list of subcontractors:—

Steelwork—Messrs. Redpath, Brown, & Co.

Carving—Messrs. H. H. Martyn & Co.

Italian granite and marble—Messrs. J. Whitehead & Sons.

Biancola wall linings and steps—The Art Pavements and Decorations, Ltd.

Lifts—Messrs. Waygood-Otis, Ltd.

Electric light—Mr. F. Geere Howard, who was also responsible for the ventilation.

Electric light fittings—Messrs. Osler and Mr. F. Geere Howard.

Heating—Messrs. Colls & Sons.

Bronze entrances—Messrs. Singer & Co.

Staircase enclosures—The Bromsgrove Guild.

Plaster enrichments—The Bromsgrove Guild and Messrs. Searle & Co.

Casements—The Crittall Company.

Revolving door — Messrs. H. Elliott & Co.

The fire-resisting glass, part of the gun-metal windows, lantern lights, ceiling lights, pavement lights, and stallboard lights were by the Luxfer Company.

Public Trustee Offices, Kingsway.

THIS building occupies a site having frontage to Kingsway, Sardinia-street, and Lincoln's Inn-fields. The elevations are of Portland stone with a granite base to the height of the ground floor window-sills. The plan of the building is in the form of three sides of a square, with a large well for lighting and ventilation in the middle.

In the basement and sub-ground floors are placed the numerous strong-rooms, filing-rooms, storerooms, heating apparatus and pumps, motor-room, etc. The entrance to the building is from Sardinia-street, with subsidiary entrances, which at present are not to be used, in Lincoln's Inn-fields. All the floors except the top floor are practically similar in their arrangement with the principal rooms on the second floor. The whole of the top floor is given over to luncheon-rooms, etc., for the use of the staff. Three passenger lifts are provided, and also small lifts for the quick conveyance of papers, etc. A system of vacuum cleaning pipes has been installed throughout the building.

The purpose for which the building is intended, viz., a block of offices, has been strictly kept in mind in the design and execution of the work. The walls throughout, except in the entrance hall and lavatories, are plastered and distempered. Those of the entrance hall are of "Stuc" material, and the lavatories white glazed bricks. The floors of the rooms are of maple blocks, and those of the corridors and lavatories are of terrazzo. That of the entrance is of marble tiles.

Messrs. Kingerlee, Oxford, carried out the foundation contract, and Messrs. Galbraith Brothers, Camberwell, that for the superstructure. The following is a list of the various subcontractors:—

Wood block flooring—Messrs. Burgess & Co., Liverpool.

Terrazzo—Bell's United Asbestos Company.

"Stuc" work—Mr. H. Tanner.

Marble flooring—Messrs. Anselm Odling & Co.

Steel sashes—Taylor Manufacturing Company, Wolverhampton.

Heating—Messrs. Cannon & Hefford.

Asphalt—French Asphalte Company and Val de Travers Asphalte Company.

Railings—Messrs. Humphries, Jackson, & Ambler.

Wrought-iron grilles and special door furniture—Messrs. Whiteside & Carslake.

Lifts—Messrs. Aldous & Campbell.

Boilers setting—Messrs. Strode & Co.

Granite work—United Stone Firms, Ltd.

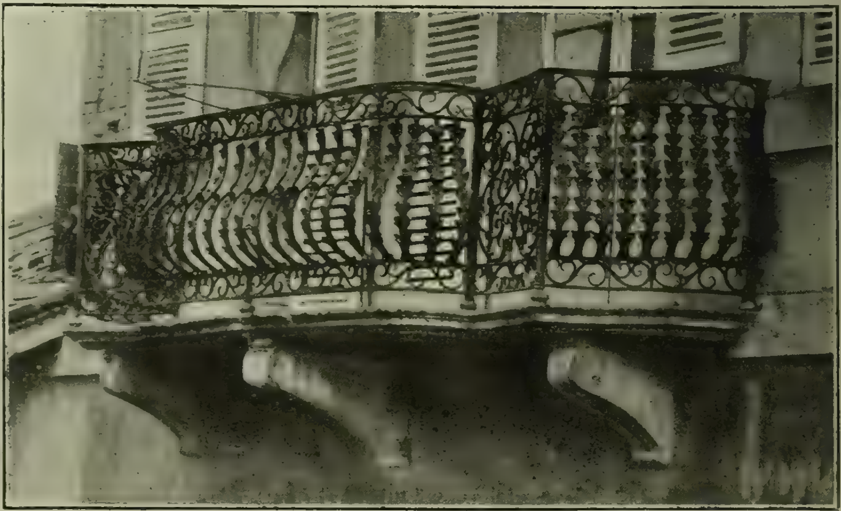
Portland stone—Bath and Portland Stone Firms, Ltd.

Strong-room doors—The Ratner Safe Company.

Vacuum cleaning system — Sturtevant Engineering Company, Ltd.

Metal shelving—Messrs Estler & Co.

The building has been designed by and carried out under the supervision of H.M. Office of Works.



Old Italian Ironwork: A Seventeenth-Century Balcony, Cremona. (*See page* 11.)

New Premises of the Phœnix Assurance Company, Ltd.

THE new premises of the Phœnix Assurance Company occupy a site of about 12,000 sq. ft., with frontages of 37 ft. to Abchurch-lane, 145 ft. to King William-street, and 143 ft. to Sherborne-lane. With so large an extent of frontage the construction of the retaining wall, which was carried out in reinforced concrete, was a matter requiring much time and care. The building itself, which is eight stories in height, including two basements and one story in the roof, is a steel-frame structure, and the floors are on Messrs. Homan & Rodger's system. The staircases throughout are in reinforced concrete, with York stone treads and risers.

The main façade is 78 ft. high. The ground-floor story forms a basement stage, with arched windows and rusticated stonework; the first floor is treated as a pedestal to the Corinthian Order which embraces the second and third floors; while the fourth floor forms an attic above the main cornice. The whole of the front is in Portland stone, worked at Messrs. Trollope & Colls' yard, with the exception of the plinth stones and the central and side entrances in King William-street, all of which are in grey unpolished Aberdeen granite.

The interior of the Phœnix Company's main office, which occupies the central portion of the ground floor, is finished in marble, Piastraccia being used for the wall linings and Campan Vert for the columns and pilasters. This office is dominated by a central feature of octagonal form, which rises through the first floor with an arcaded gallery, and is surmounted by a large dome light, 20 ft. in diameter and 40 ft. above the floor. No little difficulty was experienced in obtaining the necessary supplies of marble, and the building still lacks the marble columns and pilasters in the main office, which have had to be finished temporarily in plaster

The Phœnix Company itself occupies by far the greater portion of the premises; but five floors from sub-basement to second floor on the portion of the site at the corner of Abchurch lane are leased to the National Bank of Egypt, while the three floors above this are available for letting, as are also a good ground floor office with basement at the corner of Sherborne-lane and other offices approached by a side entrance further up that street.

The electrical work was carried out under the direction of Mr. S. G. Castle Russell, the company's consulting engineer. The lighting is by a semi-indirect system from ceiling pendants, which gives a soft and pleasing effect. No desk standards are used. The heating is by hot water. A system of forced ventilation has been provided in the basements, but the whole of the rest of the building is ventilated by fresh-air inlets behind the radiators and exhaust ducts connected with electric fans on the roof. The two artesian wells, installed under the direction of Mr. Albion T. Snell, have borings 450 ft. deep.

The general contractors were Messrs. Trollope & Colls, for whom Mr. Doust acted as foreman on the works. The building was carried out from the designs and under the direction of the architects, the late Mr. J. Macvicar Anderson and his son, Mr. H. L. Anderson, and much valuable assistance in the planning of the premises and in other directions was received from the company's chief surveyor, Mr. Frederick Izant. The quantity surveyors were Messrs. Franklin & Andrews, of No. 25, Ludgate-hill, E.C., and Mr. H. England, of No. 64, Victoria-street, S.W.; and Mr. A. Nisbet has acted as clerk of works.

The following is a list of subcontractors:—

Messrs. Thompson & Walford, Architects. (*See page* 12.)

Granite work—Mr. John Fyfe, Aberdeen.

Marble work and mosaic floors—Messrs. Burte & Co.

Glazed brickwork and faience work—Leeds Fireclay Company.

Stone carving and bronze "Phœnix"—Mr. C. H. Mabey.

Wood and marble carving—Mr. Geo. Hawkings.

Wood block floors—Acme Flooring and Paving Company.

Chimney-pieces and stoves—Messrs. Shuffrey & Co.

Ironmongery—Mr. James Gibbons.

"Koperoid" windows and steel fittings—Crittall Manufacturing Company.

The large central dome in the main hall of the Phœnix office, also the domes in the office of the Bank of Egypt, the windows to light basement in coppered iron, fitted with electro glazed prisms, all the fire-resisting glazing, and the Luxfer Special Pavement Lights were by the Luxfer Company.

Balconettes and stallboard grilles—Messrs. H. H. Martyn & Co.

Lift enclosures and other ornamental metal work—Messrs. H. W. Cashmore & Co. and Mr. W. Shrivell.

Strong-room doors and steel fittings—Milner's Safe Company and Messrs. Chubb & Sons.

Plaster work, plain and decorative—Mr. James Annan and Messrs. H. H. Martyn & Co.

Wall tiling—Messrs. James Annan and Messrs. Martin Van Straaten & Co.

Drainage and sanitary work—Messrs. Trollope & Colls.

Sanitary fittings—Messrs. Dent & Hellyer.

Glazing—Messrs. Alfred Goslett & Co.

Passenger lifts—Messrs. Waygood-Otis.

Electric lighting, bells, and telephones Messrs. Belshaw & Co. and Messrs. Finch & Wheeler.

Electric light fittings—Messrs. Verity's.

Heating and ventilation—Messrs. Strode & Co. and Messrs. James Slater & Co.

Artesian wells—Messrs. Alfred Williams & Co.

Pneumatic tubes—Lamson Pneumatic Tube Company.

Fire hydrants—Messrs. Merryweather & Co.

Drying the building—Turk System Drying Company.

Wren's First Design for St. Paul's.

WREN's first design for St. Paul's is known chiefly by small and inadequate illustrations in architectural text-books, and we have tried from the existing material to give our readers a better idea of the design than can be usually gathered. The magnificent model of it in St. Paul's can neither be adequately seen nor photographed in its present position in the Cathedral. It should be placed in a suitable position in South Kensington Museum and, we may add, repaired. Our views of it show the columns of the portico as they would appear if the missing ones were replaced. We give a descriptive article on page 8.

The Frieze of the Parthenon.

THESE illustrations are the expression of the author's views as to the original state of portions of the Parthenon frieze.

The height of the frieze is but little over 3 ft. About 290 ft. of its length, which decorated the exterior of the cella of the Parthenon, were recovered from the hands of the Turks and brought to England by Lord Elgin in 1803, and sold to the English Government and placed in the British Museum. A large portion is still in its original place on the southern side of the cella. Some portions are in the Acropolis Museum, Athens; and casts of some of the portions not brought away are in the Louvre and in the British Museum.

The relief of the figures is nowhere much above 3 in. The whole would probably have been fairly perfect to-day had it not been for the bombardment by the Turks in the eighteenth century. The director of artillery was, however, on this occasion a German. Kultur then, as now, was manifesting its value.

At the present moment the portions in possession of the British Museum are carefully packed and consigned to the cellars, in order to protect them from any further effects of Kultur.

A restoration on a minute scale (only 3 in. or 4 in. high) was made in 1829 or 1830 by John Henning. Later, the same artist produced the large restoration which is to be seen on the exterior of the Athenæum Club.

This latter includes, I think, the entire ninety-two groups which formed the frieze when complete. There have, in fact, been several restorations made at one time and another. A modern instance is to be seen at Cardiff in the newly-erected Empire Theatre in that city.

A. C. C.

OLD LONDON BRIDGE AND ITS APPROACHES.

THE subject of bridges is an exceedingly interesting one, as they are a type of building which is often impressive because of the element of size and the juxtaposition of water, for the usual purpose of a bridge is to carry a roadway over a ravine or depression, which in most cases means a stream or river. While other great monuments are generally detached from the requirements of utility, bridges are a necessity, and their appropriate design and decoration become an object of the first architectural importance. In former days bridges frequently carried buildings and covered ways, and there seems no reason why this should have fallen into desuetude, certainly as far as covered ways are concerned, for wayfarers need protection from the storms of wind and rain which sweep along water-courses, and the provision of covered ways would add much to the picturesqueness of our great London bridges at a cost which cannot be considered as excessive, seeing the advantage gained.

Probably no structure of ancient and modern days, even the Colossus of Rhodes or the Temple of Diana at Ephesus, has aroused more interest and admiration than Old London Bridge, a drawing of which by the late H. W. Brewer accompanies this issue. Wonderful as it was in reality, the description of it, written by a Roman ecclesiastic, who

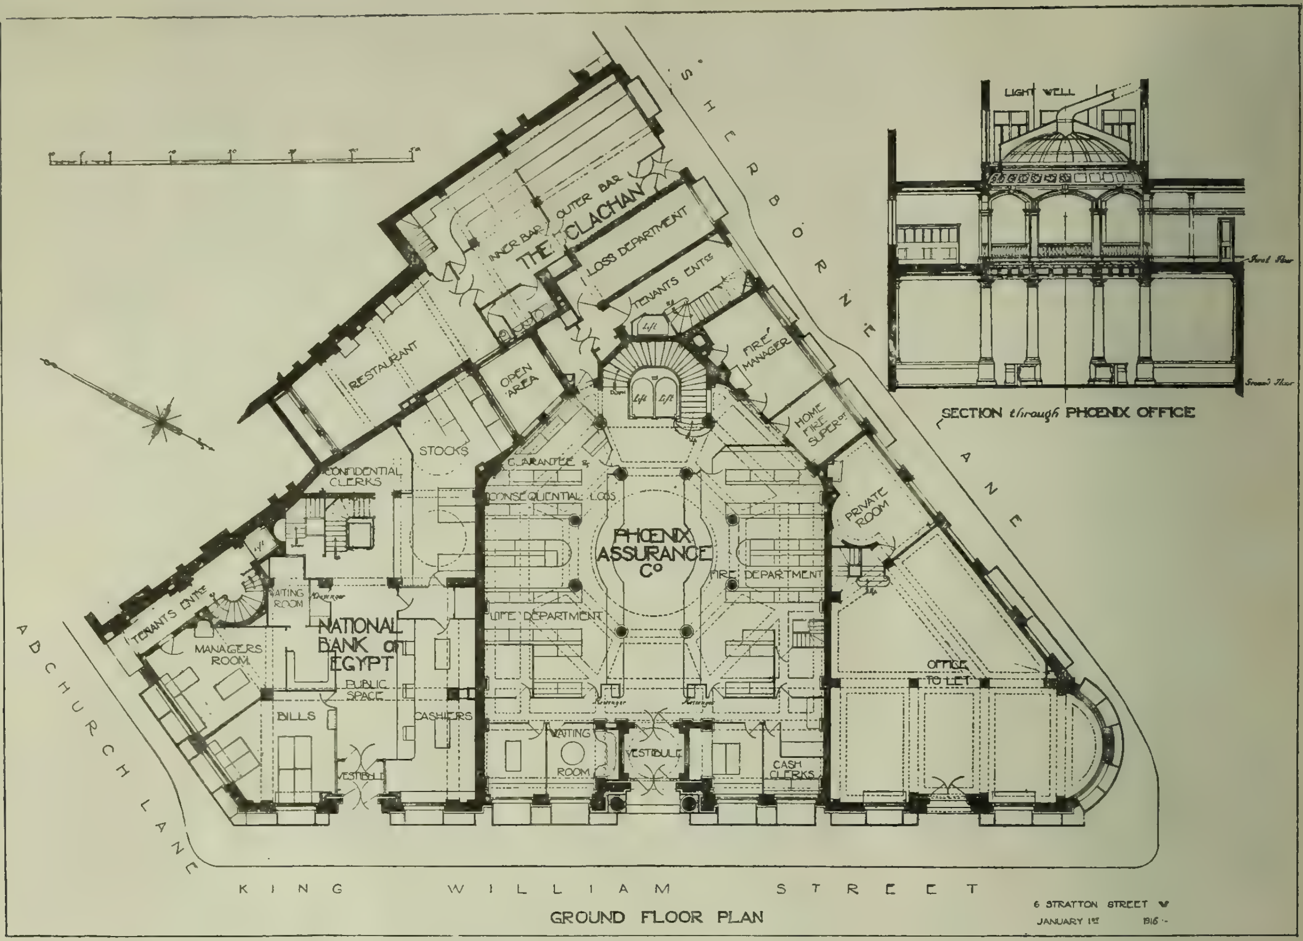
saw it in the sixteenth century, almost equals the marvels related in the voyages of Sir John Mandeville, and we need scarcely say greatly exaggerates its grandeur. Amongst other things he describes the bridge as being a mile long, 100 ft. high, and crowned with palaces and churches. Although, of course, this is an exaggeration, yet it serves to show what a very remarkable impression this edifice must have left upon the mind of the writer, who, be it remembered, had seen the architectural glories of Italy and those of the "Eternal City." It is fortunately possible for us to recall the appearance of the ancient bridge during almost every period of its existence; the great difficulty, however, in making a restoration of it, is to avoid anachronisms, and to be certain that the various buildings shown were all in existence at the same epoch, for the changes and alterations were very frequent, owing in a great measure to the numerous vicissitudes which befell this structure, especially from fire and tempest. The first stone of "Old London Bridge" was laid in the year 1176, and it was completed in 1206. The architect was a parish priest, who is known as Peter of Colechurch. Whatever defects there may have been in the way of construction, however much the architects and engineers of later centuries, and even of the present day, may have sneered at his primitive ideas of engineering science, yet Peter of Colechurch did what probably no man ever did before or since his time—that is, he built a bridge of stone, nearly a thousand feet long, over a great tidal river, which lasted nearly seven centuries. The bridges erected by his eighteenth-century critics in London have all disappeared, and, if we may judge from the experiences of the past few years, there is little to lead us to suppose that any of the bridges erected in our day are likely to last for even one-third of the time. Although in later times the bridge was covered with houses, yet, as originally erected, the only buildings upon it were two gateways, one at either end, and the double chapel erected upon the eastern portion of the centre sterling. Probably no other buildings of any kind were erected until the close of the fifteenth century. From this time, however, the bridge came by degrees to assume the appearance of a street with breaks at intervals. At the middle of the sixteenth century these intervals between the houses were reduced to three. During the fourteenth century a tower with a gateway beneath it stood upon the seventh pier from the Surrey side, and upon this tower the heads of traitors who had been executed for high treason were exposed. In 1577 this tower was taken down, and the heads and limbs of the traitors were removed to the gate at the Southwark end of the bridge. This Southwark gate appears to have been either partly or entirely rebuilt at that period, and the magnificent structure called "Nonesuch House" was erected on the site of the ancient tower. What was the precise object for which "Nonesuch House" was erected, whether it was a Royal palace or was intended as a residence for the Lord Mayor, we are unable to say. It is stated by some writers to have been composed of timber, wrought and carved in the Low Countries, and floated piecemeal up the Thames. To judge from the representations of it, it must have borne a strong resemblance to the timber houses in Hildesheim and other towns in the north of Germany. Between the Southwark gate and "Nonesuch House" stood another very remarkable house, which was adorned with semicircular bow windows and crowned by a battlement. That this building was of considerable importance may be gathered from the fact that its foundation-stone was laid by the Lord Mayor in state in the year 1577. Probably this building served the same purpose as the present Bridge House.

The pier upon which "Nonesuch House" stood was connected with the next pier to the south, not by an arch, but by a drawbridge, and this drawbridge has given rise to much controversy; for, as London Bridge had nineteen piers, some people maintain that it should be described as possessing twenty arches, but others more correctly maintain that a drawbridge could not be reckoned as an arch, and that, therefore, it could only be described as possessing nineteen arches; and this is the view taken in a singular old poem by John Leland, entitled "Kykneion Asma," or the "Song of the Swan," a translation of which is given in the Chronicles of London Bridge, 1827. The passage we refer to is as follows:—

> The streaming river bears us on
> To London's mighty Babylon;
> And that vast bridge, which proudly soars,
> Where Thames through *nineteen arches* roars
> And many a lofty dome on high
> It raises towering to the sky.

The greatest defect of Old London Bridge was the immense obstruction to the water-way, caused by the piers and projecting sterlings. Some idea of this may be gained from the fact that, although the bridge was 926 ft. long at low tide, when the water did not cover the sterlings the "water-way" was reduced to 194 ft., and an inquiry into the dangers attending the navigation of the old bridge shortly before its destruction reveals the fact that, although the water at low tide was 10 ft. deep under the central arch, it was sometimes only 18 in. deep a few yards "below bridge." The fall of water at the ebb of the tide was often as much as 8 ft., and the "full flow" must have been equally great in the opposite direction, so that the river could only have been navigable for large barges within about an hour or so of high tide. The Thames watermen became very expert at what was called "shooting the bridge"—that is, taking a boat down the cataract without either upsetting it or going under water. The term, "shooting the bridge" has remained in common use, although it does not now convey the idea of danger, which it formerly did. Our view represents the bridge at "slack water." The existing ancient views of London Bridge are very numerous; those in the Crace collection have been carefully described in the *Builder* of April 12, 1879, page 390. The earliest is an illumination dated 1419. The most important alteration which London Bridge underwent were in 1759, when the great centre pier was removed and replaced by an arch, and the houses on the bridge were removed. Attached to the approaches of London Bridge were several buildings of considerable interest. At the London end stood the Church of St. Magnus, which was destroyed by the Great Fire in 1666, and was subsequently rebuilt by Wren, and on the opposite side of

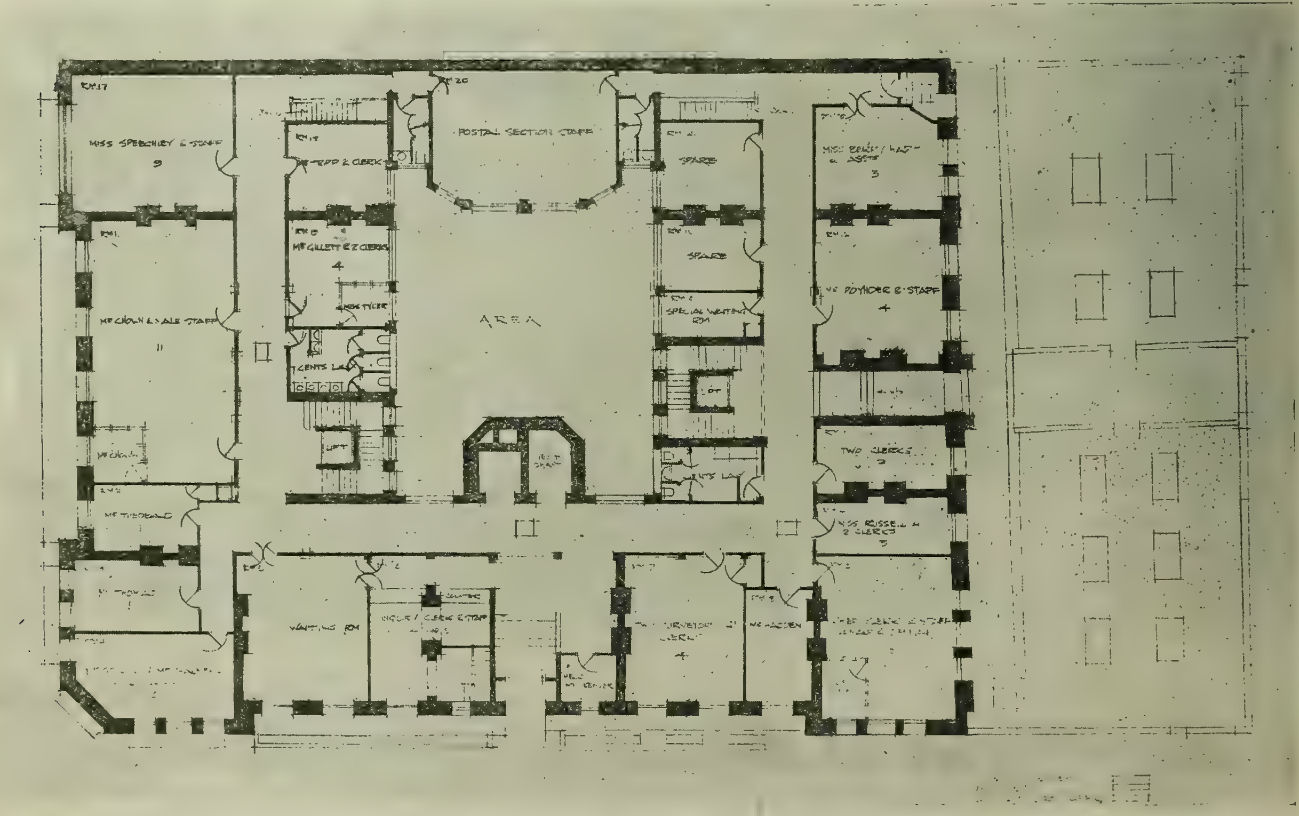


Phœnix Assurance Company's Offices.

The Late J. Macvicar Anderson and Mr. H. L. Anderson, Architects. (*See page* 13.)

the road were erected the first London waterworks; they seem to have possessed a lofty and picturesque tower, and to have dated from about the year 1588. At the Southwark end were the corn-mills, the Priory and Church of St. Mary Overy, and Winchester Palace.

We trust that the days of great architectural bridges are not yet past, and while the introduction and use of steel has rendered the



Offices of the Public Trustee. (*See page* 12.)

By Mr. A. C. Conrade.

combinations possible more difficult to treat architecturally, the use of ferro-concrete in the closing decades of last century may give opportunities of once more reconciling architectural and engineering requirements where the use of masonry bridges is for some reason or other out of the question. But the old bridges of England and the Continent, and the wonderful structures of the Romans, remain to show us what effects of design are possible in bridge building, while the great war of a hundred years ago finds its most fitting commemoration in the magnificent lines and mass of Waterloo Bridge.

Sculptured Drum of Column from Temple of Artemis, Ephesus: Conjectural Restoration. (*See page* 14.)

By Mr. A. C. Conrade.

The Bridge House Trust, which has had so powerful an influence upon London's development, is one of its oldest institutions. It is to-day a great power, and meets some of the pressing necessities of London which, without its aid, would have had to be met from the rates at the expense of other services.

It originated in the rents of the houses on London Bridge, of which there are records as early as 1122, and when in 1176 Peter of Colechurch built Old London Bridge its revenues became considerable. King John decreed that the rents and profits should go towards the repairs and maintenance of the bridge. Henry III. seized the revenues, but the Corporation regained possession, and in 1281 tolls were instituted. About this time private benefactors began to leave legacies for the Bridge House Trust, and, later, its income was further increased by profits from fisheries and water supply. Some idea of the extent of the income can be derived from the record that in 1358 the number of shops on the bridge was 138, and the total rent £160 4s.—in those days a very considerable sum. From a later record, in 1777, a day's toll was from £9 to £10, and the annual toll about £1,500.

The funds were administered by the Warden, who became a most important personage, and, although at first there were serious deficiencies owing to the rapid decay of the bridge and its bad construction, there was soon a surplus sufficient to enable the Trust to lend money for public objects, which it did from early in the sixteenth century. In Elizabeth's reign a standing committee was appointed with a Bridge Master to preside, and this is the authority to-day. The Committee is elected by the Liveries at midsummer.

The Trust erected Westminster Bridge in 1749 and Blackfriars Bridge in 1760. Southwark Bridge followed, and since then the Tower Bridge has been built. London and Blackfriars Bridges have been widened, and the accumulated riches of the Trust are now to be devoted to the much discussed St. Paul's Bridge.

◆

EDINBURGH ARCHITECTURAL ASSOCIATION.

Owing to the fact that the majority of the members are now on military duty, the Associate Section of this Association have had to suspend their syllabus. The senior body, however, arranged their programme for the present session, and amongst other interesting items is included a lecture by Mr. W. T. Oldrieve, F.R.I.B.A., F.S.A.(Scot.), on "A Recent Visit to New Zealand and Some of the South Sea Islands." Several visits have been arranged for, and the annual excursion will be to Perth on Saturday, July 1.

REINFORCED CONCRETE REGULATIONS.

The regulations with respect to the construction of buildings wholly or partly of reinforced concrete and to the use and composition of reinforced concrete in their construction, which were made by the London County Council on July 6, and confirmed on July 13, have been allowed by the Local Government Board, and the Board directed that they should come into operation on January 1. The details of the regulations were published in the *London Gazette* on the 28th ult.

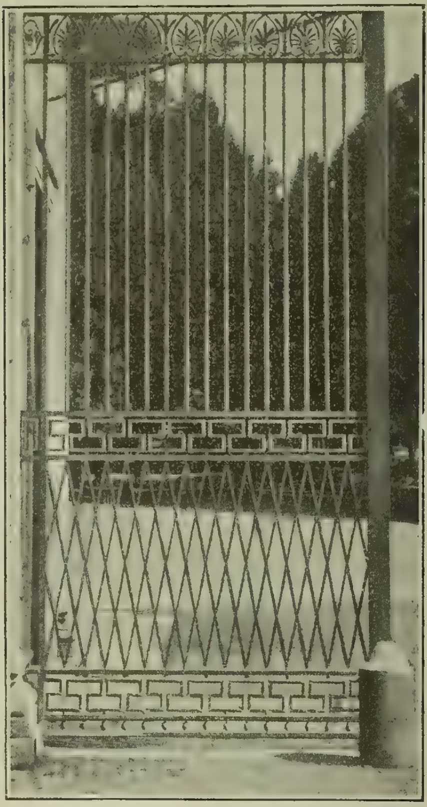
CORRESPONDENCE.

The Housing Problem.

SIR,—Will you permit me to open the new year by inaugurating a discussion in your columns on this important subject?

The normal growth of house building since the Finance Act, 1909, has been interfered with, and most people and all architects and quantity surveyors hope that the speculating builder has been killed without hope of resurrection, and this decay in growth has been emphasised most unwisely since the war. It will, however, have to be faced in the future, and perhaps the new era will be in the direction of erecting extensively garden cities. We should all like to see this enlarged upon. But does this movement really reach the class to be catered for? I suppose everybody agrees that after the war the interest on money will be permanently increased; also the cost of building (along with other commodities) will be raised, not only with wages, but owing to the demand for every class of building material to make good the wastage of war, as well as the decay in the natural growth of buildings since 1909, so that it will be difficult to build a "garden city house," with land, roads, gas, water, and drains, to let at 10s. a week. If a good workman is earning 40s. a week, he is no more justified in living in a house at 10s. a week than another man with £400 a year is in living in a house of £100 rental. But even if he will pay this rent, the man earning 40s. a week need not be looked after. He can save sufficient money to build his own dwelling with the help of his building society. But the casual labourer earning from *nil* to 20s. a week must be housed. It is a duty on citizenship. There are three courses open:—(1) He must pay higher rents to attract capital in preference to investing in War Loans. (2) The Corporation may build; but if Corporations build they should be restricted from letting houses at a rent insufficient to pay interest on the cost, for one must remember that Corporations can borrow money at 2 per cent. less than most private owners, and it is unfairly pauperising people for a Corporation to build houses worth 6s. rent and let them for 4s. They have just as much right to build houses worth £60 rent and let them for £40, and to take the difference from the rates, and legislation should enforce and limit such restrictions as interfering with private trade. Or (3) there must be a drastic alteration in building by-laws, and I think, Sir, that this is the most feasible principle. If you make a survey of the houses in any city or large town which have been built twenty-five or thirty years, these houses are out of date; not only that, but the district is out of date for the class of house. Yet in accordance with the building by-laws these houses are so well built that they will last for another 100 years or more, and it is impossible to ask the owner to scrap them. Still more impossible is it to show him that it is a profitable investment to scrap them and to build something else, as the rent has never been sufficient to pay both interest and a sinking fund. Yet in any other trade they would have been scrapped or remodelled long ago. Then, even if such solidity is necessary, fashions change. Why may I not build a house with rooms 6 ft. 6 in. high if I wish? If I can't let it, I am the loser. If I do let it, it is because someone else wants it.



Old Italian Ironwork: Gateway, Villa Umberta, Rome. (*See page* 11.)

No doubt there will be wastage during the war, but in every previous European War refugees have come to England; many have remained, and have partly made good the casualties and taught us new trades. Everyone wishes the wage-earner to be comfortably housed in a decent dry house (wherever practicable with a bath), but unless he will pay a much higher rent or induce the actual builder to continue the good lesson taught to the munition worker, of doubling his output, it resolves itself either into Corporations building all houses at the cost of the ratepayers, or reducing radically their building restrictions, and, to quote Mr. Nettlefold's seasonable words, "that local authorities should be content and wisely content to encourage others to build houses." W. H. WOOD.

FIFTY YEARS AGO.

Railway Matters.

THE new Farringdon Station of the Metropolitan Railway and the extension line to Finsbury have been opened for traffic. The time occupied in running between Finsbury and the Great Western Railway at Bishop's-road is twenty-two minutes, calling at all the intermediate stations. There are to be four lines of rails on the extension line, two for the Metropolitan line proper, over which the trains now run, and which will be continued to Trinity-square, and there, by a junction with the District Metropolitan line, form a portion of the "Inner Circle" line on the narrow gauge. The other two lines are on the mixed gauge for the accommodation of the Great Western, Great Northern, and Midland Companies' traffic; but the mixed gauge lines are not carried further at present than Aldersgate Station.

FAMOUS CHURCHES OF RUSSIA:

BLAGOVIESHCHENSKI SOBOR IN THE KREML', MOSCOW.

MILLIONS annually flock to Paris, to Rome, and other famous cities of the Continent, but in the past not many have thought it worth their while to pay a visit to the historic towns of Russia. Truly Russia has been neglected. This state of things, however, will pass, and pass quickly. Russia and Britain, having joined hands in the titanic task of upholding the cause of a common humanity, are friends as never before. It is the first step. After this will follow conducted tours and enhanced facilities of communication. Russia will become the fashion and Petrograd popular. But of all the towns in Russia it is safe to say none will claim more interest than Moscow, the famous capital of mediæval Russia.

The almost complete isolation of Russia during the period extending from the fourteenth to the eighteenth century provides the cause of its development along such seemingly narrow yet characteristic lines. Throughout that period, so important in the evolution of modern Russian history, the town of Moscow was the very centre of its existence. She was "Our little Mother Moscow," and only by those who understand the Russian temperament and know how endearing and expressive the language may be made can the full force of such a title be appreciated. To her, as a child to its mother, the people turned in times of trouble and affliction, and at all times for guidance in spiritual things. She was the Mecca of their faith, the favoured dwelling-place of their rulers.

It is true that when St. Petersburg was founded, in the early years of the eighteenth century, Moscow lost her temporal pre-eminence. Peter the Great practically forced the whole fashionable world—the Court and nobility—to take up its abode in his new capital on the banks of the Neva. Moscow henceforth was left behind, and happily left behind, in that stern struggle for progress along Western lines which was inaugurated by the shipwright Tsar. But Moscow has never lost her place in the nation's affections, nor will she ever. Whatever happens, she will never cease to be Holy Moscow, the "Little Mother." She is the most Russian town in Russia, the centre of religious life to the most religious people in the world.

The recollection of her past historic *rôle* has something to do with this; but also there is the underlying feeling that she is representative, as is no other town, of all that is revered in Russian national life.

What Moscow has been to Russia the Kreml' has ever been to Moscow—the centre of its life and interest. For within its ancient walls is the Grand Palace of the Tsars and the Uspenski Sobor (the Cathedral of the Assumption), wherein the Tsars assume the Crown. Moreover, within this ancient citadel on every hand are buildings which recall the glories of its storied past. Most noteworthy perhaps of these are the "Spass na Borou" (Our Saviour in the Wood), the most ancient church in Moscow, and two other cathedrals besides the Uspenski. One of these, dedicated to the Archangel Michael, is the national Valhalla where are buried the Grand-Dukes and Tsars from the time of Ivan "Kalita" (Money-bags) (1341), to Féodor Alexievich (1682), with one exception. The other is the Cathedral of the Annunciation, whose history we are at present to consider.

Of the cathedrals, Blagovieshchenski Sobor is perhaps the most interesting from an architectural point of view. All three stand grouped around the great tower of Ivan Veliki on the Sobornaya Ploshchad—the Cathedral Place—close by the Grand Palace. But the Cathedral of the Annunciation, owing perhaps to the fact that it was nearest to the old palace, the remnants of which still exist incorporated in the fabric of the Terem, was the "Chapel Royal," so to speak. At its font the children of the Royal House were baptized. At the Holy Door before its altar the Tsars were wedded, and within its precincts approached the other sacraments of the Russian Orthodox Church. In fact this cathedral was for five centuries the scene of most semi-State ceremonies in which the Grand-Dukes and Tsars took part.

Although less favoured in some respects than the Uspenski or Archangelski Cathedrals, it is externally of more pleasing aspect and design. Being smaller than either, and less in altitude even than the grandiose modern palace behind it, it appears all the more picturesquely compact in consequence. Its general appearance as seen from the north-east may be gathered from the illustration. It will be observed that it is typically Russian in its general appearance, and is perhaps as good an example as any to be found of this distinctive type. Almost entirely neglected in our text-books and in our schools, there is yet a fund of instruction and interest to be gleaned from the study of this curious type—an admixture of Tatar and Byzantine art.

The remotest date to which we can go back in the history of Blagovieshchenski Sobor is 1291, when a wooden church was erected on this spot, the highest within the Kreml', by Andrew, son of Alexander Nevski, Prince of Novgorod. The foundation of a new church by Vasili Dmitrievich is recorded in 1393, while eleven years later (1404) we are told in the Annals "commenced the subscription for the Church of the Annunciation on the Grand-dukal Court." The walls of this early church were painted in fresco by Andrei Rublev, a Greek Theofan, and a monk Prokhor.

Ivan III., soon after throwing off the Tatar yoke (to which the Russians had been subject for two hundred and forty years and from which they were released in 1480), proposed to erect a new church. Hence, in the summer of 1482, as attested in the Annals, "began to be demolished the church on the Square of the Annunciation, the upper part being pulled down." Thus it would seem evident that the ground floor was left for a time. The annalist mentions particularly that this ground floor was left "for keeping the treasury"—that is all those precious objects and treasures belonging to the church, and also the Sovereign's personal property. The popular name of the "Church of the Tsarian Treasure," by which it was sometimes designated, arose from this custom of storing beneath the churches valuable objects. In those days Russians of wealth were well advised in thus consigning their valuables to the protecting care of the Church. They were for the most part lawless times, and men thought little enough of theft from their neighbour. But theft from the Church was quite another matter. Larceny may have been prevalent, but even the thief would not commit the sin of sacrilege in Russia.

It is noticeable that most references (in guide-books and the like) to the demolishing of this early church speak as if it was a stone church which had been pulled down. By inference they seem to suggest that the original ground floor still remains. But it is altogether more probable that it was of wood, for the annalist goes on to speak of the foundation of a stone church of the Annunciation in the spring of 1484 and of its consecration in 1489. This is substantially the church that yet stands. Architects and craftsmen were procured from the neighbouring principality of Pskov to undertake the work as being more skilful in stonework than the Muscovites.

In the year 1547 it was seriously damaged in the great conflagration which destroyed nearly the whole of Moscow. We are told that such was the intensity of the flames that liquid metal ran along the streets. In all about 1,700 adult "souls" lost their lives. In the Church of the Annunciation, as in many another church, many precious icons were destroyed and the whole edifice threatened.

Ivan IV. (the Terrible) repaired the damage, securing for the purpose the Milanese architect, Aloisio da Carezano, who was then at work in Moscow. He reconstructed the gallery and, in addition, built the four chapels above, adorning the interior of the church with painted icons from Novgorod, Pskov, and other places. He is said, too, to have covered the cupolas with plates of gold, the metal for the purpose having also come from Novgorod. From which it may be gathered that this Tsar, Ivan "Grosnagho," although he fully deserved the name, yet had spasmodic interludes of piety, and was thoroughly Russian in his devotion to the Orthodox Church. There are indeed few churches dating from before his time in Moscow that do not owe some embellishment or renovation to him.

By these additions the outward appearance of the cathedral was much improved, not only by the new chapels with their four additional cupolas, but also by the Renaissance arcading of the gallery. The latter had hitherto been either an open passage-way or perhaps covered in with a superstructure of wood.

Throughout the sixteenth century the Annunciation continued to be the Court church, and it was so until the time of the first Tsar of the Romanov dynasty (Mikhail Féodorovich, 1613–1645). It was this monarch who bestowed upon it the full title of "The Cathedral Church of the Annunciation of the Most Holy Virgin." It was he, too, who had an approach constructed uniting the church with the Royal apartments of the old palace. This improvement, by means of which the Royal Family could pass directly and unobserved from the palace to the choir of the church, was probably included in the restoration which followed the sack of the church by the Poles in 1610.

The Poles occupied the town and put the inhabitants to the sword. It was a time of anarchy following upon the death of Boris Godunov—it was the break between the dynasty of the Ruriks and the Romanovs. The restoration of peace followed, and the election of Tsar Mikhail, to a great extent owing to the efforts of a butcher of Nizhni-Novgorod. He made an eloquent appeal to the people and moved them to something like concerted action. Under the leadership of Prince Pozharski they besieged the town, which eventually fell to them in 1612.

Just two hundred years later the cathedral again suffered considerably. The French invasion of 1812 spared none of the edifices in the Kreml', and the rest of the town was burned by the Russians themselves. The Royal Palace was reduced to ruins, and horses were stabled in the cathedrals. In the words of an officer in the French Army who was there present, "Moscou en grande partie n'offrait plus à nos yeux qu'un amas de ruines."

The cathedral was restored by Nicholas I., and in the reign of the succeeding Tsar, Alexander Nikolaevich, the nine cupolas were re-covered with gilded bronze plates.

In surveying its architectural features we must bear in mind that the long basilican form, so familiar to us in the West, is seldom if ever adopted in Russian churches. In their plan they deviate but little from the square, and are generally small. Blagovieshchenski Sobor is no exception to this rule. It is indeed bijou, and in plan is only slightly oblong.

Its ogive roofing, the novel appearance of which is noticeable in the illustration of the north façade, is typically Muscovite. In the drawing the peculiar setting of the central ridge of the lower range of gables will be noticed. This feature, which also occurs on the south side, is necessitated by the structural features of the interior. The peculiarity would not, of course, be observable from the ground.

But the dominant exterior characteristic of Russian ecclesiastical architecture is undoubtedly the pear-shaped cupola. In some instances the bulbous dome issues from a tapering roof or spire, but is then less pleasing than when, as in the present case, the dome is superimposed upon an elegant slender drum rising from low-pitched vaulting. In this case there are nine cupolas; mostly, if more than one there are five. But the mere number is immaterial, the important point being that they should accentuate the importance of the great central dome.

Introduced into Russian architecture by the Tatars and ever since adhered to by the Russians, this form of dome is purely Asiatic. It is the one trait which, strangely enough, raises the native church architecture from being merely a phase of debased Byzantinism into something noble and distinguished.

Each cupola is surmounted by an imposing openwork cross, supported by chains which depend from each arm to the bulb. At the foot of each cross there is a crescent. This combination is of frequent occurrence on Russian churches, and by some writers it has been said to be a relic of the Tatar occupation. The Tatars, they say, changed the churches into mosques and placed the Moslem crescent above them, and when Ivan Vasilievich drove them out he restored the crosses, but left the crescents to symbolise the triumph of the Cross over the Crescent. This may be considered rather as a clever fiction than as the fact. The most satisfactory and most probable explanation is that it is allegorical of the Saviour (Lord of Earth) issuing from the Blessed Virgin (Queen of Heaven). Such a symbol, expressing as it does vital and familiar principles of the Orthodox faith, would appeal most strongly to the minds of the faithful.

The great cross on the central dome is of gold, and by good fortune escaped destruction by the French in 1812. It was known that one of the edifices in the Kreml' was surmounted by a cross of gold, and the looters, seeing the great gilded cross on the tower of Ivan Veliki near by, thought that must be it. They pulled it down, doing much damage to the top of the tower, but were disgusted to find when they examined the cross that it was only gilded wood. Meanwhile, if they had but known it, the real gold cross was just across the square—where it is to-day in fact—on the central dome of Blagovieshchenski Sobor.

The exterior work of the five ancient drums, and of the apsidal termination—the arcaded cornice with slender pilasters resting on corbels—strongly resembles much of the early work upon the churches of Vladimir, Suzdal, Novgorod, and other districts. Already in the twelfth century it was an established feature of Russian architecture; and even that early it had developed considerable ornateness of detail, as witness the quaintly decorated "fringe" round the diminutive Dmitrievski Sobor at Vladimir.

The chief apartment, the church proper, is raised above the street level 5½ *arsheen* (12 ft. 10 in.). It is approached by a fine covered gallery which flanks the church on three sides. Below is the crypt, a series of vaults extending beneath the galleries and the nave, but yet on the street level, and appearing on the south façade as a deep ornamental socle or plinth to the whole superstructure. This device of raising the floor of the church and surrounding it with a gallery is one which is frequently found in Russian churches, and is appropriate to the climatic conditions of the long Russian winter. It secures the edifice with its costly decorations and precious contents from destruction by damp and cold. On the other hand, in the heat of summer the surrounding gallery gives a welcome coolness to the interior nave. The vaults are reached by steps from the south-west corner of the gallery.

Access to the gallery is gained at the north-east porch by a flight of broad steps from the Sobornaya Ploshchad. Exteriorly it appears as an arcade of semicircular arches resting on ornamental pilasters, the whole giving unmistakable evidence of the influence of the Western Renaissance. This tendency is noticeable in all of the work of the period of Ivan "Grosnagho," although here and there one finds the more barbaric tone of Tatar influences.

The interior walls of the gallery and the whole of the low-arched cross-vaulting are covered with frescoes and elegant mural decoration. These paintings have undergone so many restorations that it is unlikely that much of the original work is left. Their exact age, therefore, is problematic. They are attributed by one well-known guide-book to the year 1508. This, of course, is out of the question, as the present gallery was not built until after the fire of 1547. Another writer states that they were painted in the year of the great plague, 1771. What is most likely is that at its completion the gallery was decorated, at least in part, and the pictures subsequently restored or replaced at the dictates of the Imperial taste. For instance, in 1621, Tsar Mikhail Féodorovich "commanded to be painted the arches and walls uncovered at the side-wing of the church" (somewhere towards and near the north-eastern stairway). Again, by order of Tsar Alexis Mikhailovich, the porch and stairs were painted (probably restored) by the icon-painter, Ivan Filatev.

Seen in the diffused light they have no doubt a strong devotional effect upon the deeply religious Russian mind. But quite apart from this they are of much interest to all students of the Byzantine tradition. The subjects are mostly of sacred import, but there is a most interesting series of portraits of ancient philosophers and historians, which are said to have been originally executed in the sixteenth century by the Russian artist, Féodor Edikeeff. Socrates, Plato, Menander, Anacharsis, Zeno, Ptolemy, Plutarch, Thucidides, and others are represented, each supporting a cartouche upon which is inscribed an extract from their works. On the eastern wall of the gallery, over the entrance, is a great painting of the Saviour, popularly supposed to have a supernatural origin. "Not made by human hands" is the way the faithful put it. One cannot help wondering how in such a case they ever allowed one Simon Ushakov to restore it in 1661. He may have been a celebrated icon-painter in his day, but it seems bordering on the disrespectful.

Two doors lead from the gallery into the nave of the church, one on the north side and one on the west. The southern wing of the gallery is now, and has been for many years, partitioned off. At one time access was possible by the stairway at the south-eastern porch, which forms so striking a feature when the church is viewed from beyond the railings which enclose the Sobornaya Ploshchad. This entrance, now disused, is traditionally mentioned as having been built by Ivan for his own convenience in going to church. It would certainly prove a short cut to the niche which he usually occupied during the services and which is still shown, by the south-western pier, opposite the Royal door of the Iconostas. The Tsar's throne now stands in front of this niche. Again, this south-eastern entrance is mentioned as being the spot from whence were published the banns of this Tsar's fourth marriage. This marriage was against the Canon law of the Greek Church, but he forced the prelates to confirm it and also to endorse without protest his frequent divorces—his fifth, sixth, and seventh marriages.

This portion of the gallery was subsequently set apart as a convenient place for the Tsars to rest after the services, and the porch became the usual place for the disbursement of the Imperial charity. The eastern portion is now occupied by the chapel of St. Nicholas, founded by Nikolai I. about the year 1835.

The portals of the doors leading into the church are worthy of more than passing notice. They are without a doubt one of its most interesting decorative features. The two are almost identical in their elegant Renaissance scroll-work carved in relief. Their delicacy of execution establishes their sculptor in the front rank of artists in stonework. They have been said to be native work, but they are usually, and I think correctly, attributed to the Milanese Aloisio. This artist was one of many craftsmen and master-builders whom the Grand-Duke Ivan III. invited to Moscow at the end of the fifteenth century. He did much good work in Moscow at that date, and was occupied in rebuilding the wing of the old palace behind the cathedral from 1499 until 1508. Some of the doorways still existing in the Terem Palace are also attributed to him. They show a similar delicacy of feeling, and are no doubt attributable to the same hand. They date, of course, from the early years of the sixteenth century.

It is impossible in mere black and white to give an adequate idea of their workmanship. But in the accompanying detail drawing one may at least get a hint of their design. Imagine a ground of cerulean blue, with rich relief heavily laid with gold and set with precious stones, surrounding massive red-copper doors, decorated with figured panels, and surrounded by frescoed walls. Truly the Russian loves to adorn the House of God.

The interior is no less worthy of study. In the midst of the church are set the four square piers which support upon a lofty four-arched vault the great drum of the central cupola. The vaulting is thus divided into nine bays. From the four corner bays are raised on similar elegant drums the four cupolas of next importance. The two more easterly ones, beyond the Iconostas, are visible from below, but the westerly pair are screened from view by intermediate vaulting.

The whole of the interior, including the pillars and the vaulting (which is invariably unrelieved by ribs), is decorated with mural paintings of varying merit. These frescoes comprise representations of Christ and His Saints, the Visions of the Apocalypse, the Supplication of the Damned, and the Glorification and Reward of the Saved. Their actual age is doubtful. Fabricius, in his work "Le Kremlin," 1883, states that they were first painted in 1482. This is clearly a mistake, as the present building was not started until 1484, and was not finished until 1489. That they may be fairly ancient is shown by the fact that they are mentioned in early inventories of the church. Moreover, early in the sixteenth century (in 1508), by order of the Grand-Duke Vasili Ivanovich, it was decorated in fresco—at any rate in part—by the monk Theodocie Deonicev. It may be that he only restored others, for the Annals at this time record: "Ordered . . . (the church) . . . to be signed by gold," and "commanded also . . . the upper part of the church to be covered and gilded." We must bear in mind, too, the great fire which in 1547 devastated the church and without a doubt necessitated the renovation of the whole interior. Subsequent restorations were carried out by Peter the Great in 1697, and by Catherine II. in 1770; there is a tablet on the south-eastern pillar to this effect. Again it was restored in 1835 by Nickolai I.

One may surmise that some of these "restorations" were entirely new work, for in 1882, while occupied in renovating the paintings then occupying the walls, the architect Schokhin and the painter Fartussov discovered that there were more ancient paintings beneath. They reported their discovery to the Emperor, and a Committee was formed to supervise their preservation. This Committee was composed of an archæologist, Zabel, an architect, Rozanov, and a painter, Botkin. The more recent paintings were removed and those beneath once more restored. With such a record one may reasonably doubt if any vestige of the original work is now extant. Like the celebrated stockings of Sir John Cutler, immortalised by Martinus Scriblerus, they have been so often mended that we cannot distinguish any part of the original materials.

As is the case in the parent Greek Church, so with its Russian offshoot, orientation is strictly observed.

The altar is placed in the centre of the triple apse, and in front of it is the elaborate Iconostas which crosses the nave at the easterly pair of piers. Entirely dominating the interior by its wealth of decoration and its display of sacred pictures, the Iconostas is still fine. But anciently the bands and columns of bronze which divide it into five tiers of icons were encrusted with gold and silver and enamel work. It was necessary to restore it entirely after the pillage of 1812.

In the centre is the Royal door of massive silver, and to the right of it is a fine example of Byzantine art, a painting of the Saviour, which is said to date from 1337. Another picture on this side worthy of special note is of the Annunciation. It is of Greek origin and is surrounded by a rich and costly frame. On every Iconostas the Saviour is depicted on the right next to the Holy Door and next to that is always placed the "titular picture," as it might be called, of the patronage of the church in question.

But the most celebrated of all the icons in Blagovieshchenski Sobor is undoubtedly the Virgin, which is on the left of the door. This is the Donskoi Virgin, the "Virgin of the Don," and is a much revered icon of fourteenth-century date, in a frame of pure gold. The frame still shows signs of the damage caused by French hammers. In their search for all that was worth taking they mistook this frame for mere copper-gilt, and so left it. That it was thus passed over is, of course, popularly attributed to miraculous agency. But this is only a later addition to its fame. It obtains its name from the Grand-Duke Dmitri Donskoi, who carried it affixed to his standard at the battle of Kulikovsko, in 1380. Here is what the Chronicles of Novgorod tell us of this battle:—

"And having heard this, that a great Tatar force was coming against him, the Veliki Knyaz Dmitri Ivanovich gathered many soldiers and went against the godless Tatar, trusting in the mercy of God and in His Immaculate Mother, the Mother of God, the eternal Virgin Mary, calling to his aid the honourable Cross. For he entered their country beyond the Don and there was there a clean [*i.e.*, treeless] field, at the mouth of the River Nepryadva, and there the pagan Ishmælites had ranged themselves against the Christians."

They were at first fearful and inclined to run away, but they were rallied.

"And the Veliki Knyaz Dmitri with his brother Volodmir ranged their troops against the pagan Polovets people, and raising their eyes humbly to Heaven, and sighing from the depths of their hearts, said, in the words of the Psalm: 'Brothers, God is our Refuge and our Strength,' and both forces immediately met and there was a fierce battle for a long time, and God terrified the sons of Hagar with an invisible might, and they turned their shoulders to wounds [*i.e.*, fled] and they were routed by the Christians. And some were struck down with weapons and others were drowned in the river, a countless number of them."

And all this happened on September 8, 1380, "a Saturday, the day of the birth of the Mother of God."

Again the picture was taken into the battle line in 1591 by Boris Godunov, whose victory over the Tatar Kazi-Hirey-Khan was attributed to its agency.

It has ever been the custom with the Russian Army to take with them into the field of battle their beloved icons. As recently as 1904 General Kuropatkin, before starting for Manchuria, received from the hands of the Abbot of the St. Sergius monastery a holy icon. Moreover, at the outbreak of the world-war in 1914 each regiment of their modern scientifically-equipped army marched to the front with its holy banner at its head.

The Donskoi Virgin is more attractive in its treatment than most icons of the Virgin, a fact probably attributable to its Græco-Italian origin. The Mother and the Divine Infant, usually so stiffly and formally treated, are here almost human in attitude, cheek to cheek. Another picture, the Assumption of the Virgin, is depicted on the back.

Most of the other pictures on the Iconostas are modern, including the eighteen medallion heads of saints by eighteenth-century Flemish artists which surround the Donskoi icon.

Another fine old icon is within the sanctuary. It is a Virgin and Child of somewhat more formal treatment than the "Don," and is known by the name of Barlovskoi, or "The Most Holy Womb." Originally of fourteenth-century date, it was restored by Simon Ushakov, probably in 1661, when he restored the great painting of the Saviour in the gallery.

The floor of the cathedral, a present to Tsar Alexis from the Shah of Persia, is a fine example of mosaic work in jasper and agate. It is said to resemble a portion of the pavement in St. Mark's, Venice.

On the level of the nave it only remains to speak of the sacristy. Near to the cathedral, at the south-east corner, there existed until the seventeenth century a small chapel of St. Vasili the Emperor, founded in 1489. It was found to be too near to the south apse, and in 1654 it was closed and demolished. The sacristy now occupies the site. The Iconostas of the old chapel was preserved and now adorns the modern chapel of St. George above.

Over the west end of the nave is the choir, a gallery which in times past was usually occupied by the Tsarina and Tsarevna during mass and the other services. The Tsar himself always sat below in front of the Iconostas, facing the Holy Door. The throne of State is still in its place, and near it is an alcove in which, as before mentioned, Ivan "Grosnagho" usually attended the services. I say the Tsar sat below, but the Russian always prays standing, hence there are no seats in the churches in Russia.

The staircase to the choir and thence to the four chapels (which are quite separate from the church and from each other) is at the north-west angle of the nave. From the choir a door (again in Renaissance style, though not so elaborate as those below) leads out upon the roof of the gallery and thence descending by a few steps connects by a short bridge with the Palace.

By way of the roof, to the right and left, the two westerly chapels are gained. Beyond each of these, by the archways between the wall of the church and the chapels, those at the north-east and south-east are reached. This arrangement, by which the four isolated chapels are accessible only by doorways from the roof of the gallery, must strike the western mind as being curious in the extreme. One encounters many such curiosities in Russian architecture, a truly glaring instance being the monstrosity, rather than church, of Vasili Blagennoi on the Krassnaya Ploshchad. This is really a collection of separate little churches or chapels connected by passages and united under one roof.

Architecturally there is little calling for remark in the chapels. Their exterior appearance is quiet, although rather commonplace. Their severe panelling and other detail is purely Renaissance, although at the same time it is not so obtrusively evident as to make the crowning of each chapel by its ogive gables and pear-shaped cupola anomalous. The four drums are more plain than those of the older part of the church. There is no pilastered cornice such as stamps the older work with its Vladimir-Suzdal feeling.

Interiorly the roof of each chapel is composed of four vaults. The two greater rest upon the north and south walls, while the smaller pair spring east and west, joining them and forming in the centre a four-arched vault upon which is raised the drum and cupola.

The north-west chapel is known as "The Church of the Most Holy Virgin." It has what is perhaps the most ancient Iconostas in Moscow. Upon this are icons of the Annunciation and the Four Evangelists, the Lord God of Hosts, and the Last Supper. These venerable pictures are richly decorated with silver repoussé and precious gems. At the north-east is the "Church of the Archangel Gabriel," the Iconostas, furniture, etc., of which date from the time of Tsar Mikhail Féodorovich (1613–1645), and were a gift from him. The chapel at the south-west corner commemorates the "Entry of Christ into Jerusalem," sometimes called "The Jerusalem Gate." The Iconostas here again was a gift from Tsar Mikhail, and dates from 1614. The remaining chapel, which is dedicated to St. George, was rebuilt during the reign of Alexander Pavlovich. This monarch also changed its name, dedicating it to the sainted national hero, Alexander Nevski, but it is now again known by its more ancient name. The only outstanding feature is its fine old Iconostas. This, as has been mentioned earlier, was removed from the chapel of St. Vasili at its demolition in 1654.

The chapels, by some strange chance, entirely escaped the depredations of Napoleon's army in 1812. Perhaps they could not discover the way to reach them. Hence the fine gold and silver work and the precious stones which deck the Iconostases and the other church furniture of value were left untouched.

The precious treasures and relics of the sacristy were removed at that eventful time to Vologda, and so escaped likewise. Among the more remarkable of these may be mentioned (1) a reliquary containing the sponge used at the Crucifixion; (2) two copies of the Gospels presented by Ivan Vasilievich, one in 1568, the other in 1571 (both are adorned with silver, gold, and many precious stones); (3) a chalice of agate given to the church in 1328 by the Archpriest Moise; (4) two portions of the True Cross cased in gold, one adorned with pearls and various precious stones, the other enamelled; (5) the Panagia (a cross worn suspended round the neck by bishops) of Theofan, patriarch of Jerusalem (this relic is formed of stone from the sepulchre of Christ); (6) an image (cruciform) enclosing another relic of our Lord's Passion, decorated with figures in black enamel. (This precious object—a spike from the Crown of Thorns—was brought from Tsargrad (Constantinople) to Suzdal in 1383 by the Archpriest Deonicev, and thence at a later date to Moscow.)

This is but a brief review of this interesting little cathedral. In some way or another all Russian churches are of interest, for no two are alike. But over some more than over others there spreads that national tone, that spirit which is part of the Russian individuality. Situated as she is between Western civilisation on the one hand and Oriental barbarism on the other, Russia has absorbed something of the spirit of each. Hence, although she received her earliest inspirations towards ecclesiastical architecture from Byzantine sources, yet the Asiatic influence of the Tatars has left its mark. If we add to this the strong uplift which in the late fifteenth century was given to Russian architecture by the Milanese craftsmen of the Court of Ivan III., we have as a product the unfamiliar but expressive type so well exampled in Blagovieshchenski Sobor.

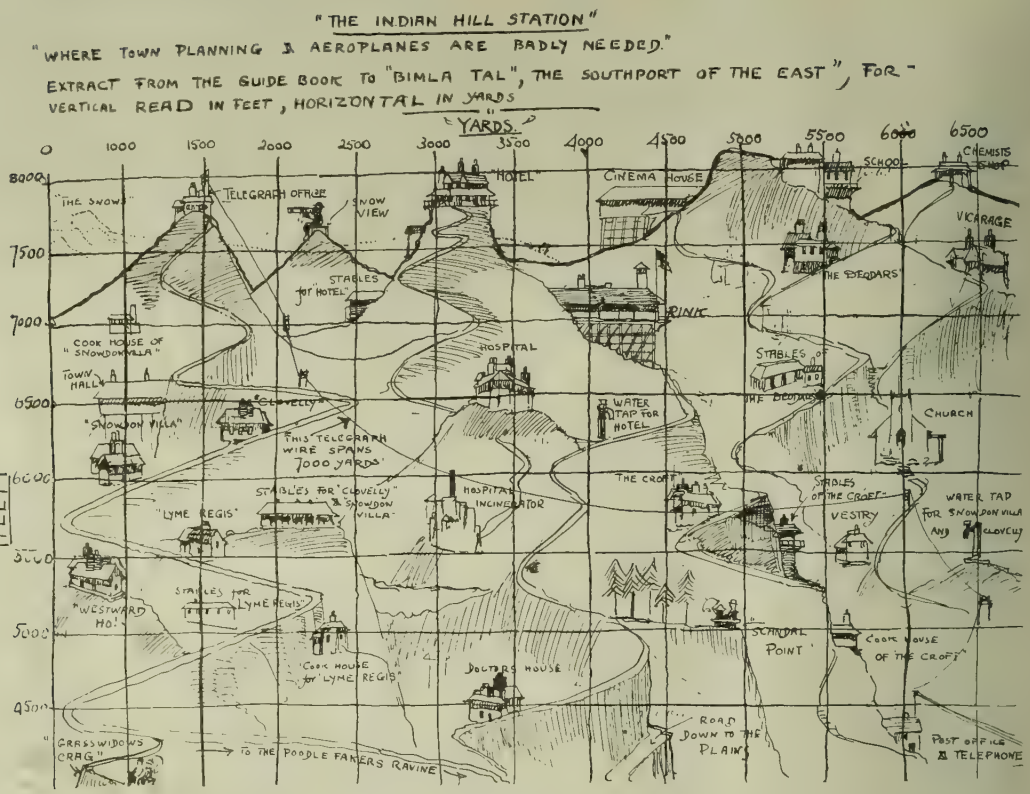
CYRIL G. E. BUNT.

BOOK REVIEW.

Experimental Physics. By HAROLD A. WILSON M.A., D.Sc., F.R.S. (Cambridge University Press. 8½ in. by 5½ in. 405 pp.)

THE author's aim as set out in his Preface is to deal thoroughly with fundamental physical phenomena without attempting to be exhaustive in the field which he includes in his survey, and though, as he states, much originality is not possible in the treatment of the branches he selects—mechanics, heat, sound, and light—his work shows an individuality which justifies yet another text-book on these subjects.

Though we are told that no previous knowledge of physics is assumed, we imagine that some mental sympathy with natural science is expected by those who use this book, and a general knowledge of elementary algebra and trigonometry is assumed by the author for its study. The first hundred odd pages are devoted to mechanics, in which section the experimental method for investigating the force acting on a body moving in a circle may be cited as an example of clear exposition and good diagrammatic illustration. Rather less space is devoted to heat and also to sound, in which latter section the chapters on wave motion and wave trains are worthy of comment, and are more advanced than much of the other matter. The last hundred pages deal with light. The book seems well suited for students beginning a college course or for schoolboys with good mathematical attainments who desire to obtain a useful acquaintance with physics. Published as one of the Cambridge Physical Series, the work is well printed and the illustrations are particularly clear and practical.



SKETCHES BY THE LATE GORDON SANDERSON.

THE accompanying series of sketches form a selection from a number collected at various times during Eastern voyages, and, although only hasty impressions collected here and there, preserve memories of pleasant places visited and serve as "*technica memoria.*" One shows the late Mr. Sanderson's impression of an Indian hill station, fitly described by a well-known architect as a place "where God made the hills and the monkeys built the houses." The details from Sanchi, India, illustrate the Grecian character of the ornament found on the early Buddhist structures; while the artist attempted, in another, to reconstruct a portion of a walled Buddhist city from the carvings found on the Sanchi gateways. The illustration of the "Golden Temple," Amritsar, illustrates the jumble of styles so often found in Eastern cities where matters of architectural moment are left to the tender mercies of the local civilian, with the result that Gothic clock towers take their place side by side with the best Oriental structures.

LEGAL SECTION.

NOTES ON CURRENT CASES.

Myers *v.* Bradford Corporation: Public Authorities Protection Act.

BY sect. 264 of the Public Health Act, 1875, it was enacted that:—"A writ or process shall not be sued out against or served on any local authority, or any member thereof, or any officer of a local authority, or person acting in his aid, for anything done or intended to be done or omitted to be done under the provisions of this Act, until the expiration of one month after notice in writing has been served on such local authority, member, officer, or person, clearly stating the cause of action, and the name and place of abode of the intended plaintiff, and of his attorney or agent in the cause; and on the trial of any such action the plaintiff shall not be permitted to go into evidence of any cause of action which is not stated in the notice so served; and unless such notice is proved the jury shall find for the defendant. Every such action shall be commenced within six months next after the accruing of the cause of action, and not afterwards, and shall be tried in the county or place where the cause of action occurred, and not elsewhere."

The above section was repealed by the Public Authorities Protection Act, 1893, and notices of action, so far as public authorities are concerned, were done away except in such cases as such notice may be required by special or private Acts of Parliament. By sect. 1 of this Act the time limit for bringing actions against public authorities and persons acting in pursuance of a public duty was altered from "six months next after the accruing of the cause of action" into "where any action, prosecution, or other proceeding is commenced in the United Kingdom against any person for any act done in pursuance or execution or intended execution of any Act of Parliament, or of any public duty or authority, or in respect of any alleged neglect or default in the execution of any such act, duty, or authority . . . the action, prosecution, or proceeding shall not lie or be instituted unless it is commenced within six months next after the act, neglect, or default complained of, or, in case of a continuance of injury or damage, within six months next after the ceasing thereof."

A series of decisions has established the position that, although the text of the Act only refers to a "person," yet this word includes "public authorities" (which words are only found in the title of the Act) in so far as they are acting in pursuance of a public duty or authority or in the execution of any Act of Parliament.

In the recent case of Myers *v.* the Bradford Corporation the House of Lords has upheld the decision of the Court of Appeal that the protection of the Act does not extend to private contracts into which a public authority enters, although such contracts may be undertaken under powers conferred upon the authority by an Act of Parliament.

The facts were that under a private Act of Parliament the Bradford Corporation were empowered to make gas and sell coke. They sold some coke to a private person, and in delivering it their carter tipped part of it through a shop window instead of down the coal-hole. In an action in the County Court for damages caused by the negligence of the authority through their carter the jury found for the plaintiff, but the County Court judge entered judgment for the defendants on the ground that the action was not commenced within six months of the act complained of, holding that the defendants were protected by sect. 1 (*a*) of the Public Authorities Protection Act, 1893.

On appeal to the Divisional Court Mr. Justice Lush held that where a public authority acting within their statutory powers had undertaken obligations towards a particular individual, and in the course of discharging them they or their servants were negligent, it was not a case in which they were acting directly in pursuance or in execution of any Act of Parliament or of any public duty or authority, and consequently the defendants were not protected by the Act.

Mr. Justice Bray, on the other hand, held that the plaintiff's action was founded on tort, and was maintainable without alleging any contract; that the delivery of the coke sold was done in execution of the defendants' public duty or authority, and that the defendants were protected by the statute.

There being no conclusion arrived at by the Divisional Court, the judgment of the County Court judge held good, and an appeal was made to the Court of Appeal, which held that there was no obligation created by statute under which the Bradford Corporation were bound to supply coke to the plaintiff, but when they did so they entered into a voluntary private contract, and not in the execution of any public duty or authority. Lord Justice Swinfen-Eady distinguished this from the case of a public authority which works a tramway where it is their duty to admit any person as a passenger who presents himself and pays his fare, and behaves himself properly. Strictly speaking, he said, there was no contract between the public authority and the passenger, because there was no volition on the part of the authority to make a contract with the intending passenger. The fact was they were bound to make the contract with the passenger if he chooses to make it with them, so that it is really not a case of contract which only occurred in law when the parties to it made it of their free choice. There is no case in which it was freely at the option of the public authority seeking the protection of the Act either to make or to refuse to make a particular contract to which it has been held that the Act applies.

It is a matter of some importance to builders and contractors who have dealings with public authorities to have the matter definitely settled that when they have entered into contracts with a local authority for specific purposes the authority cannot bar a claim upon them which is based upon contract because an action has not been brought within six months. This was settled in the case of the Midland Railway Company against the Withington Local Board ([1883] 11 Q. B. D. 788), which was an action to recover back money paid to the defendants in respect of works of sewering, etc., in an alleged private street. The action was held to come within the scope of sect. 264 of the Public Health Act, 1875, and was brought too late, but the Master of the Rolls said that if the action had been brought for something done or omitted to be done under an express contract the section would not apply.

But in cases where there is no express contract between the plaintiff and the local authority the authority can claim the protection of the Act if an action is not brought within six months of the occurrence.

It is not always easy, however, to determine when the "act, neglect, or default complained of" has happened, and everything depends upon the time from which the six months is to be reckoned.

In the case of Backhouse *v.* Bononi ([1861] 9 House of Lords Cases 503) A. was the owner of certain houses standing on land which was surrounded by the lands of B., C., and D. E. was the owner of mines running underneath the lands of all these persons. He worked the mines in such a manner (without actual negligence) that the lands of B., C., and D. sank in; and after more than six years' interval their sinking occasioned an injury to the house of A. A. brought an action against E., and the defence raised was that the action was barred after six years from the working in the mine which caused the sinkage; but the Court held that the right of a person to the support of the land immediately around his house is not in the nature of an easement, but is the ordinary right of enjoyment of property, and till that is interfered with he has no legal ground of complaint, although, in fact, something may have been done which (without his knowledge) has occasioned results that will afterwards affect his property, and therefore the action could be brought at any time within six years after the enjoyment of the house was interfered with by the actual occurrence of the mischief.

In the case of the Darley Main Colliery Company against Mitchell ([1886] 11 Appeal Cases 127) similar circumstances were under consideration. The lessees of coal under Mitchell's land worked the coal so as to cause a subsidence of the land and injury to houses thereon in the year 1868, and compensation was made for the injury then caused. No further workings were made, but in 1882 a second subsidence took place, again causing injury, but it was found that there would have been no such later subsidence if the lessees had left enough support under the respondent Mitchell's land. The House of Lords decided that the cause of action in respect of the further subsidence did not arise till that subsidence occurred, and that the respondent could maintain an action for the injury thereby caused, although more than six years had passed since the last working by the lessees.

The two examples cited have no reference to public authorities, but the case of Crumbie *v.* Wallsend Local Board ([1891] 1 Q. B.) was an action under somewhat similar circumstances in which a public authority was concerned. The facts were that the local board made an excavation under a street for the purpose of laying a sewer. The excavation was not properly filled in, and in consequence subsidence of the plaintiff's land with injury to houses thereon took place, which began at a period more than six months before and went on continuously down to the commencement of an action by the plaintiff in respect of the damage caused by the subsidence. The defendants urged that no fresh cause of action had accrued within six months before the date of the writ, and that the continued damage during that period did not constitute a fresh cause of action, but the Court of Appeal held, following the decision in Darley Main Colliery Company *v.* Mitchell, that an action could not be brought for the excavation (which took place more than six months before), but that a cause of action arose when damage to the plaintiff's property resulted therefrom by subsidence, and that each fresh subsidence which did not exist the day before gave a fresh cause of action. Lord Justice Fry said the sole question was whether the cause of action accrued within six months before action brought as required by sect. 264 of the Public Health Act, 1875, and he concurred in the view that each fresh subsidence created a cause of action within the meaning of the section.

The case of a continuing injury was considered in Hague *v.* Doncaster Rural District Council ([1909] 100 L. T. 121). The plaintiff was the occupier of farm lands, and he sued the defendants for damages for the death of certain cattle owing to the pollution of a stream flowing through his land by an effluent discharged into the stream from sewage works belonging to the defendants. The claim specified the death of three animals in November, 1906; July, 1907; and September, 1907; but the action was not commenced until April 22, 1908, and the defendants relied upon the Public Authorities Protection Act, 1893. In the County Court the judge held that the Act afforded no protection to the defendants, and gave judgment for the plaintiff for damages. This decision was upheld by the Divisional Court on appeal, and Mr. Justice Bigham, as he then was, said the action was brought in respect of an act done by the defendants in pursuance of a public duty, and, when one asks what the act was in respect of which this action was brought, the act is and must be the pollution of the stream. That is the act which the defendants did in pursuance or execution of their duty. They did not kill the cows in the execution of any duty at all. He did not know when the pollution began, but it began before the death of any one of the three cows, and it continued down to the moment when the action was commenced. He was of opinion that the act complained of was a continuing act, and there was a continuing injury by means of which the defendant suffered damage. He therefore came to the conclusion that the action was instituted in the case of a continuance of an injury or damage within the meaning of the Public Authorities Protection Act, and, having been brought before the matter complained of had ceased, the limitation placed upon sect. 1 of the Act, which would have applied in other cases, does not apply since the action was brought in time.

A similar decision was given in the case of Harrington *v.* Derby Corporation ([1905] 1 Ch. 205) and from dicta of Mr. Justice Buckley, as he then was, it might be gathered that he regarded the decisions in the cases of Backhouse *v.* Bononi and Darley Main Colliery Company *v.* Mitchell as applicable to cases in which public authorities as distinguished from private persons or private trading corporations are concerned; but there is apparently no decision directly bearing upon the point, and it may be gathered from the judgment of Mr. Justice Bigham and the decision in Crumbie *v.* Wallsend Local Board, quoted above, that except in the case of a continuing injury the date from which the six months are to be reckoned is the date of the "act, neglect, or default complained of," and not the time when the damage results from the act, etc., and it is very doubtful whether, if an act is committed by a public authority more than six months before the damage shows itself, any action at law can be successfully maintained against them.

LAW REPORT.

Workmen's Compensation Act: Award against Builder.

AT Clerkenwell County Court on December 22, before his Honour Judge Howland Roberts, a claim under the Workmen's Compensation Act was made against Mr. William Green, builder, of Cressida-road, Holloway, by Maud Cane, a widow, of Anatola-road, Dartmouth Park-hill, N., in respect of loss of her husband.

Mr. Giveen was counsel for the applicant, and Mr. Tindal Atkinson appeared for the respondent.

Evidence was given to the effect that applicant's husband, James Cane, while employed by Mr. Green, and engaged on work at a house in Miranda-road, received fatal injuries through some brickwork falling upon him.

Judge Roberts observed that he had to decide whether the accident arose out of, as well as in the course of, deceased's employment as a builder's labourer. Mr. Green had a job of underpinning a wall at the house in question, and deceased, who had only been in his employ for five days, was told to clean up the bricks, and in his spare time to go and help the plasterer inside the building. In the absence of respondent, deceased was seen knocking away at the brickwork of the wall where the underpinning was going on. A little time afterwards there was a fall of brickwork. Deceased was discovered with bricks lying upon him, and he died shortly afterwards from the injuries sustained. Was there any evidence to satisfy him (the Judge) that at the time of the accident the deceased man was doing work within the sphere of his employment? The evidence in regard to that was conflicting. Witnesses called on behalf of the applicant said it was a common practice for builders' labourers to do this class of work, and on small jobs especially. One witness, with eighteen to twenty years' experience in the building trade, said it was usual for labourers to do the cutting away of brickwork under the direction of the bricklayer, and in cross-examination he said it would be a proper part of a builder's labourer's work to cut away footings. On the other hand, the respondent, in his evidence, said that in his practice he never allowed any labourer to do that. He said: "A labourer never touches brickwork when in my employ. I do all the cutting away." Mr. Green might have his own particular rules, but unless he (the Judge) could come to the conclusion that some special orders were given to the workman when engaged, he did not think that would be sufficient to say that the ordinary sphere of a builder's labourer was limited in this case. There was no evidence as to any special orders being given at the time the deceased was engaged. Orders were undoubtedly given to the man by his employer when the latter went away from the job at three o'clock; but that was an entirely different question. That seemed to raise the question as to in what manner work was to be done rather than what work was to be done by deceased. If nothing was said to a workman at the time of his engagement, limiting the actual work he was engaged to do, was there anything to show that the man was not engaged in the ordinary way to do that which a builder's labourer would ordinarily do? His Honour did not think there was. Deceased was employed as an ordinary builder's labourer, and no instructions were given him one way or the other. On the day of the accident instructions were given him to do certain work. The man did what was in disobedience of his employer's orders, but did that limit the sphere of his employment? His Honour thought the answer to that must be "No." Although the man left work which he was specially told to do, that was disobedience which did not limit the sphere of his employment as a builder's labourer. The conclusion he (the Judge) must come to was that the accident arose not only in the course of the man's employment but also out of his employment. The widow was therefore entitled to compensation, and he entered judgment in her favour for £210 12s. and allowed costs on Scale B.

CLIMATE AND ARCHITECTURE.

ARCHITECTURE is affected by many influences, amongst others may be mentioned race, climate, materials, religion, and social conditions. Of all these influences climatic conditions have had the most obvious direct effects. It is not proposed to consider how, indirectly, architecture has been affected through the influence of climate on the personality of the architect. Different people hold different views on this matter. We may quote the late F. W. Moody as being interesting: "A southern climate seems to affect and elevate the imagination as much by its genial influence on the organisation of man as by the beauty of the scenes it presents. . . . I fear we must conclude that those who are, as it were, habitually saturated with the larger and more ideal aspects of nature, and whose life and faculties expand under their influence, must, in the long run, be superior to those who dwell in a less genial climate." Considering more direct influences, we may note that climate is the principal factor that determines the type of roof and window of any building. The former is the more important, for the history of architecture is very largely the history of roofing. With regard to fenestration, Mr. Walter Cave says:—"It was not till the time of the Roman Empire that the admission of light came to be considered as an integral part of the design."

A climate such as that of Egypt, which is very hot with a slight rainfall, results in the use of a flat roof, the simplest method of protecting a building from heat; the exclusion of wet being of secondary importance, a sloping roof becomes unnecessary. To obtain light only small openings are used, it being natural in a hot and very sunny climate to prefer a dim light, as a relief from the outside glare. In sunny lands artists seem to use bright colours naturally, and details are refined. We see all these results in the ancient architecture of Egypt, even down to the vividly-painted ornaments and delicate reliefs. One important point to be remembered in designing buildings for Europeans in the tropics is that the white man needs protecting from light rays, which are very harmful to the nervous system, as well as from heat. "The pigmentation in the skin of a coloured man cuts off light rays, and he has therefore only to shield himself from heat rays to be perfectly comfortable." The flat roof is still generally employed, and is very convenient for dwelling-houses, as it affords pleasant sleeping spaces during hot weather.

Greece has brilliant sunshine and less heat, but more wet, to contend with than Egypt; the consequence is that the slightly sloping roof, by means of which rain-water is conveyed from the building, becomes a necessity. The slope adopted for the roof settled the proportion of the pediments. The natural method of excluding wet from a building with a pitched roof is to make the roof plane advance beyond the external face of the wall, thus covering the joint between the roof and wall; as a result we obtain the cornice, which may be said to spring out of an absolute constructive necessity. The Greek temple was beautified by the addition of the peristyle, which is of great value as a protection from sun and rain, and which keeps the building behind cool. The sculptures are also protected from the weather. The main frieze in the Parthenon is under the peristyle, while the frieze of the external Order and the sculpture in the pediment had great projecting cornices over them. The details and ornament, owing to the abundance of bright sunshine—and to the marble employed—are extremely delicate and refined, and colour decoration was freely used.

In Italy climatic conditions are very similar to those of Greece, so that it is evident that the modifications made by the Romans in developing their architecture, partly on Greek lines, were not due to differences of climate.

Romanesque churches were built in the South of France with a ribbed barrel vault over the nave, supported by a half-barrel vault over each aisle. Such an arrangement allows of no clerestory and becomes less suitable, owing to lack of light, the further north we go.

In northern countries, where we have more rain and occasional snow to encounter, steeper roofs are advisable, with ordinary building materials, than those used in Greek and Roman buildings. Windows are larger and details to be satisfactory must be bolder.

The use of groined vaulting, instead of a continuous barrel (as had been discovered in Rome), allowed light to be obtained in the upper part of a building, and in Romanesque architecture, particularly in the northern parts of France and in England, groined vaulting was developed for this purpose.

The use of the round arch in groined vaulting led to many difficulties, and ugly stilted arches had sometimes to be used. The application of the pointed arch did away with all these difficulties; by its use ample light was provided, and this method of construction became the normal one in the north of France and in England.

When the Renaissance in architecture spread to England and France it did not at first entirely upset traditional methods of building; thus "we find in the Early Renaissance chateaux of France the steep roof and the great chimney-stack, and in England Inigo Jones's Coleshill retains these features."

BUSINESS PREMISES, REGENT-STREET, W.

Building operations are in progress in Regent-street at the corner of Little Argyll-street, W. The general elevation will conform to the design of the premises at Oxford-circus, already carried out by Mr. Henry Tanner, F.R.I.B.A. Part of the new structure will be a branch of the Union of London and Smiths Bank, Ltd., the architects for which are Messrs. Dunn, Watson, & Curtis Green, Lincoln's Inn-fields, W.C. The remainder will be occupied by Messrs. Dickens & Jones, Ltd., for whom Messrs. Stephens & Munt, Hans-road, Knightsbridge, are acting. The general contractor is Mr. James Carmichael, Trinity-road, Wandsworth, S.W.

BUILDING MATERIAL AND EQUIPMENT, NEW ZEALAND.

H.M. Trade Commissioner in New Zealand has forwarded extracts from the local Press, from which the following particulars are taken:—The ratepayers of Auckland have authorised the municipal authorities to raise a loan of £115,000 for the purpose of carrying out the following works:—Erection and equipment of market buildings, £55,000; establishment of a fish market, £20,000; water supply in Grey Lynn, £10,000; construction of drainage works at Remura, £30,000.

THE BUILDING TRADE.

THE REBUILDING OF BELGIUM.—I.

WE have received the following statement of the nature of the proposals for the rebuilding of Belgium, how they will be financed and their proposed scope, from an eminent Belgian architect now in this country, and it may be regarded as practically official :—

"The Belgian refugees in England and France had scarcely settled themselves into their temporary homes before, with that propensity of co-operation which is so characteristic of the nation, they began to arrange meetings for the interchange of their ideas on the reconstruction of Belgium.

In a very short time this movement was widely extended in every direction, and became of such importance that the Belgian authorities themselves were drawn into it. On February 11, 1915, an International Congress was held in London solely to discuss the question of the reconstruction of Belgium.

The Belgian Minister of Public Works presided, and among those taking part were the directors of the English Garden Cities and Town Planning Association (who had organised the Congress), delegates from Holland, Russia, and Poland, and different members of the Commission Royale des Monuments de Belgique.

His Majesty the King of the Belgians honoured the Congress with his most marked support, and telegrams of congratulation were exchanged between the King and those present at the Congress.

Other associations have been created at the same time on similar lines both in England and France, and even in the country now under enemy occupation. Some of these societies are provincial, and their aim is to collect information regarding those who have suffered through the war, to watch over their interests, and to arrange for the complete restoration of all kinds of damaged property. They will also, directly if it is possible, work at the improvement of the economic situation in the province. Each of these Provincial Committees has already formed Sub-Committees for the Arrondissements.

In short, there exists a complete and well-organised scheme which is steadily enlarging its scope, and the Belgian who is throwing all his heart into this work for the regeneration of his country has the feeling, perhaps illusory, but none the less comforting, that during this time of preparation he is thus drawn closer to his native land.

Faced by this great rush of eager workers, and of minds fertile in new ideas, it became necessary to plan out their course, and the Belgian Government, in the person of the Minister Helleputte, architect and engineer, passed a law whose different clauses defined the exact limits within which this movement of reconstruction might work.

This law, dated August 25, 1915, prepares for the new conditions of reconstruction for towns and monuments, and even for private property. It reads as follows :—

Article 1. "Vu l'article 26 de la Constitution, qui confère l'exercice du pouvoir législatif au Roi, à la Chambre des Représentants et au Sénat ;

Vu l'impossibilité de réunir les Chambres législatives ;

Sur la proposition de notre Ministre de l'Agriculture et des Travaux Publics.

Nous avons arrêté et arrêtons :

Article 1er. Les communes sur le territoire desquelles des constructions publiques ou privées ont été détruites par suite des faits de guerre, sont tenues d'établir des plans généraux d'aménagement destinés à servir de base aux autorisations de construire ou de reconstruire, à délivrer le collége échevinal.

Le Ministre de l'Agriculture et des Travaux Publics peut, à la demande des administrations communales intéressées, dispenser celles-ci de cette obligation, soit pour une partie, soit pour l'ensemble de leur territoire." *

This clause shows that the Belgian Government wish the towns to be rebuilt in accordance with modern æsthetic and hygienic ideas. The Government will leave the work of preparing plans for the towns to be rebuilt in the hands of the municipalities and with the former owners of the ground, which is divided into very small lots.

At the same time the clause provides (only in the case of some unimportant communes, no doubt) that the municipal authorities may be left free to deal with financial questions, so that they are not compelled to obey the laws laid down for towns whose resources would permit them to carry out the most elaborate schemes.

Article 2. "Ces plans doivent être approuvés par le Roi. Lorsque l'importance des projets le comportera, le Ministre de l'Agriculture et des Travaux Publics soumettra les plans, pour avis, à une commission spéciale composée de :

1. Les membres correspondants de la Commission Royale des Monuments et des Sites résidant dans la partie non envahie de la province.

2. Les membres effectifs de la Commission Royale des Monuments et des Sites résidant dans la partie non envahie du pays.

3. Un membre de l'administration communale intéressée.

Cette commission sera présidée par le Gouverneur de la province ou, à son défaut, par un député permanent.

A partir du moment où la capitale, sera libérée, la Commission spéciale sera composée des membres effectifs de la Commission Royale des Monuments et des Sites, résidant dans la partie non envahie du pays et d'un membre de l'administration communale intéressée.

Elle sera présidée par le président de la Commission Royale des Monuments et des Sites." †

This clause states that the "Commission Royale des Monuments et des Sites," formed entirely of artists, engineers and architects of well-established reputation, will be the final judges of the completed plans for the large towns. In other words that these plans will be carefully and skilfully examined, and that the Belgian towns after the war will look beautiful and artistic, while at the same time they will be hygienic and practical.

The six other clauses deal with the approval of the new buildings by the communal and provincial authorities, with the expropriation which it will be necessary for the State or the communes to make, and with the penalties which will be inflicted for violations of the law.

It is clear, therefore, from our examination of this law that from now onward Belgium is ready for the moment when it will be possible to start on the work of restoring her ruins. The Belgian Government has also made arrangements for the temporary housing of refugees on their return to their country, and could at once send into the country all the materials necessary for the erection of temporary shelters as soon as their territory is evacuated.

Two questions present themselves on the mind directly the restoration of the towns is spoken of.

Where will Belgium find the necessary money, and where, having the money, will she obtain building materials ? For the money it will be necessary to resort to private enterprise, foreign but allied ; principally, of course, England will provide it. And for building materials also we must look to England. But these questions, which are of the greatest importance, must be discussed in another article.

CHAS. PETEIN,
Architect (Brussels)."

SOME POINTS ABOUT PUBLIC WORKS CONTRACTING IN BELGIUM.

By LEON LOOTENS, Contractor of Public Works in Ostend, President of the Provincial Federation of Contractors in West Flanders ; and HENRI VOLCKERICK, Advocate, Counsellor of the Antwerp Chambre Syndicale of Contractors.

1. Concerning contractor's right to a lien upon the works until paid.
2. Concerning the special privileges enjoyed by suppliers of goods to contractors for works for the Belgian Government.
3. Concerning building owner's right to cancel contract in certain circumstances.
4. Concerning the determination of a contract in event of the death of the contractor.

SOME time ago the Builders' Merchants' Alliance, Ltd., published in London a pamphlet denouncing the dishonest practices perpetrated by land-jobbers and speculative building owners against contractors and their suppliers, and pointing out the want of a legal protection against such unfair devices. The author, Mr. W. H. Dowler, of Liverpool, characterises such a situation as "a crying trade scandal." It is a severe but justified criticism.

The reading of the above pamphlet has given the writers the idea of setting forth to British traders the means provided by Belgian Law for dealing with certain incorrect and somewhat similar operations in use in Belgium. This short exposition may help to prepare that reform of the law which the British Building Trade desires so urgently as the means of abolishing the intolerable grievance analysed by Mr. Dowler.

The knowledge of the exceptionally favourable situation created by the special protection conferred by Belgian Law upon contractors, and collaterally upon their suppliers, may facilitate commercial relations between British manufacturers of plant and materials and Belgian contractors, and facilitate the granting of the credit which will be asked for and may safely be extended to Belgian buyers after the war, when business and trade are resumed.

So this account of Belgian Law and of its mechanism will serve the double purpose of being useful to the traders of two countries united by so many common interests and by a daily increasing reciprocal esteem.

The most beautiful buildings have defects. So it is in the case of laws. It will be useful, therefore, after having stated the advantages, to point out the inconveniences of Belgian Law, and to indicate the methods of avoiding the latter by means of the contractor's privileged

---

* In pursuance of Article 26 of the Constitution, which gives legislative power to the King, the Chamber of Representatives, and the Senate ; and in view of the impossibility of calling the legislative Chambers together it is decreed as follows :—

Article 1. The communes of that part of the country where public and private buildings have been destroyed by war are expected to draw up schemes of reconstruction to be deposited with the municipal authorities. The Minister of Agriculture and Public Works can, at the request of the interested districts, relieve them from this obligation in whole or in part.

† Article 2. Schemes must be approved by the King. If the importance of the proposals makes it necessary, the Minister of Agriculture and Public Works will submit the plans to a Special Commission composed of—

1. The corresponding members of the Royal Commission of Monuments and Sites who live in the undevastated parts of the country.

2. The working members of the Royal Commission of Monuments and Sites who live in the undevastated parts of the country.

3. A member of the interested communal authority.

This Commission will be presided over by the Governor of the Province or, in his absence, by a permanent Deputy.

When the capital is evacuated by the enemy the Special Commission will be composed of the working members of the Royal Commission of Monuments and Sites who live in undevastated parts of the country and a member of the communal authority interested, and it will be presided over by the President of the Royal Commission of Monuments and Sites.

rights and by the attentive prudence of a wise trader.

1. Concerning Contractor's Right to a Lien upon the Works until Paid.

In order to favour the development of building, the Belgian Law has created a particular right, which confers a great advantage on contractors of works both from their personal point of view and that of their creditors, and consequently improves their credit if used.

This law, while providing for the general case of the owner carrying out work on his property (land, buildings, or works), places at the contractor's disposal a means of securing against the owner and his creditors the debt arising out of the execution of the work. It has been inspired by the following considerations:—

1. The contractor who improves land or who puts up, reconstructs, or repairs any building or work, adds to the value of the real estate the value created by the works, viz., the materials, the supplies, and the wages of workmen and employees spent thereon.

2. The contractor receives payment of the price either by instalments, according to the progress of the works, or at their completion, or even at a less or more distant date after their completion.

3. The contractor is always money out of pocket until the final settlement of the accounts of the undertaking, seeing that he must pay with the punctuality and the regularity of a merchant the wages of his workmen and employees and the invoices of his suppliers.

4. The owner's financial position may be altered either during the works or before the payment of the price of the undertaking or of its remainder.

5. Unknown to the contractor the owner may sell or charge with privileges or mortgages the property on which the works are executed.

6. The speculator of bad faith may grow rich at the expense of the contractor.

7. Under the scheme of taxation buildings bring more into the public treasury and, therefore, it is to the public interest that building should be encouraged.

These various considerations have caused the establishment of a special lien or privilege in favour of the contractor.

This privilege has a distinctive characteristic. While other privileges are acquired without any formality by virtue of the law, and take their rise at the same time as the debt to which they apply, the privilege of the contractor is only acquired by the observation of certain formalities, in default of which various combinations of credit and security may cause the privilege to disappear.

Those simple formalities are of a double kind; they precede and follow the works; they are:—

(*a*) *Before beginning the works*:—(1) To obtain the appointment of an expert to estimate the value of the property in the then condition of the land, works, or buildings (this appointment is made on a petition laid before the President of the tribunal of first instance of the district in which the works are to be carried out), and (2) to inscribe the report of the expert on the record of the conservator of mortgages of the same district, and, the case occurring, to call the attention of the privileged creditors or mortgagees already similarly inscribed against the property to the said valuation.

(*b*) *After completing the works*:—(1) To obtain the appointment of an expert to estimate the value of the property in its new condition (this appointment is made in the same manner as the previous one), and (2) to record similarly the second report.

If the acceptance of the work does not occasion any difficulty between the owner and the contractor, the latter ought to proceed to the second valuation and its recording within a fortnight of the acceptance. On the contrary, if the acceptance gives rise to differences, the contractor ought to proceed within six months of the completion of the works to have them accepted by the expert entrusted with the second valuation, and to the recording of the report of acceptance and valuation within a fortnight of its date.

Practically but one petition fulfilling the double object required by the law is laid before the magistrate, who appoints an expert charged with the double valuation, and, also, the case occurring, with the acceptance of the works; but this expert draws up two separate reports at the above indicated times.

To whom belongs the initiative of those simple and quick proceedings? Three cases may occur:—

(*a*) Contractor and owner, when signing the building contract, agree to constitute the lien or privilege; then the petition will be drawn up in the names of both interested parties.

(*b*) The owner, regardful of the contractor's interest, of his own accord concedes the lien or privilege to the contractor; in this case, the law gives expressly the initiative to the owner.

(*c*) The owner objects to grant the lien or privilege; in such a case the contractor has a right of acting alone. If the terms of the law do not expressly provide for the contractor's initiative, they do not exclude it; they mention the intervention of the President of the tribunal in virtue of his office; but the action of a magistrate in virtue of his office may be urged by anyone interested in the matter, and more especially by the contractor for whose benefit this action is necessary.

By the observation of those formalities the contractor becomes a privileged creditor, and secures on the selling price of the property a preferential right to the amount of the surplus value of the property disclosed by the difference between the two valuations as resulting from the works carried out on the property.

The contractor's lien or privilege ranks from the day the first official report has been inscribed on the record of the conservator of mortgages; in other words, preferred rights which may originate against the owner between the date of recording of the two official valuations cannot prejudice the claim of the contractor, so far as the difference between the valuations is concerned.

In Belgium, immovable property or real estate is submitted to a system of legal publicity, organised by means of official registers kept by a functionary of the Government, who is called the Conservator of Mortgages. He who does not appear on those registers as an owner of an immovable property, or as a titulary of an immovable right, or as a titulary of either a privileged or mortgaged right, or as a tenant of an immovable property for a long term, may not exercise any rights against the property to the prejudice of third parties.

The registers of mortgages are public and may be referred to by everyone interested in the matter.

The lien or privilege established by Belgian Law will be better understood from a few examples of cases in which a contractor may find himself, either because too confiding, too negligent, too ignorant, or too afraid of prejudicing himself with clients to exercise his right of privilege.

1. A contractor, without taking proper precautions against the owner, accepts, carries out, and delivers a work and remains creditor, in whole or in part, for the price. If the event proves that the contractor had shown mistaken confidence in granting credit to the owner, he possesses the rights of an ordinary creditor, and has to share in the whole property of the owner when all the claims enjoying preferred rights have been paid out of the proceeds of the sale of that part of property upon which the preferred rights are secured.

2. A similar situation arises even when the contractor learns of his client's financial disability prior to entire completion of the work, as it is then too late to have recourse to the double valuation and recording referred to.

3. A contractor, without making use of this easy means of securing his lien or privilege, is engaged in the works, when the owner's condition is modified and gives rise to grave apprehensions as to the payment of the price. In this hypothesis, if the remnant of the works to be finished is relatively important, and if the contractor finds it to his advantage to complete the works, he may still have recourse to those special proceedings in order to secure the residue of his claim. By so doing the contractor does not cause an injury to anyone, for he takes the situation such as it exists at that time, and he submits to its consequences by the loss of his lien for a part of his claim. He exercises only that part of his right not already lost by his previous inaction; he is not bound to leave to the owner and his creditors a gratuitous advantage by completing the works.

In both above cases the contractor against whom no justified causes of complaint may be made enjoys against the owner, and collaterally against his creditors, several means of action—for instance, he may interrupt or suspend the work; he may refuse to deliver the finished work; he may demand from the Court the dissolution of the agreement. Such measures have nothing to do with the lien or privilege. It is unnecessary in this study to enlarge upon them; it is sufficient to indicate them.

How different and strong throughout is the position of the contractor who takes the authorised precautions, and proceeds to the double valuation and the double record in of his lien. Such a one thereby acquires a new, particular, and additional right to be preferred to the other creditors of the owner, and to be paid in priority of them out of the proceeds of the property's sale within the limits of the difference between the two valuations, provided the selling price of the property reaches at least the aforesaid difference.

Some figures and some cases of application will make the mechanism of the contractor's lien or privilege more striking.

The work is agreed for, say, 100,000 francs. The first valuation gives to the property on which the contractor is about to work a value of 50,000 francs; the second valuation made after the completion of the works assigns to the property in its new condition a value of 130,000 francs. These two valuations show that the works carried out by the contractor have added to the property a surplus value of 80,000 francs. By virtue of Belgian Law the contractor's claim is privileged to the amount of this surplus value.

If the property realises, on a sale to liquidate the owner's indebtedness, 130,000 francs, the contractor, creditor for the whole contract price and the only privileged creditor, will receive in preference and priority 80,000 francs; he will remain an ordinary creditor for the residue of his claim and share in the distribution of the remainder of the debtor's estate along with the other ordinary creditors in proportion to the amount of all the claims.

If the first valuation has been recorded before beginning the works, and if the owner, who at that time had no other engagements, contracts afterwards and before the recording of the second valuation a series of preferred and mortgaged debts on the property in question, the contractor has not, in principle, to fear those new privileged and mortgaged debts, because they rank only after his claim, unless his claim exceeds the amount of the surplus value ascertained by the double valuation. Thus, for instance, if the owner has charged the aforesaid property with new privileged and mortgaged debts to an amount of 60,000 francs, the contractor will receive in preference and priority 80,000 francs out of the selling price of the property; the remainder, that is 50,000 francs, will go to the other privileged creditors and mortgagees, according to their rank and their order of recording. The contractor, for his residue of 20,000 francs of the contract price, and the other privileged creditors and mortgagees for their remainder of 10,000 francs on the amount of their claims, become ordinary creditors; those residues are joined to the amount of all the ordinary claims; the total thus obtained will serve to calculate the dividend to receive after realising the remainder of the uncharged real and personal estate of the building owner.

If, before thinking of building, the owner charges his property with privileged debts and with mortgages duly recorded, and if the whole of these combined debts amounts to 30,000 francs, the situation of the contractor who has secured his special lien or privilege is the following:—On 130,000 francs proceeding from the property's sale, 30,000 francs will be used in priority for the payment of the aforesaid privileged and mortgaged debts; a residue of 100,000 francs remains, of which 80,000 francs will be placed in preference and priority at the disposal of the contractor, and 20,000 francs remain to be divided between the contractor and the other creditors in proportion to the amount of their respective claims.

In the intermediate hypothesis of the contractor proceeding to the first valuation after beginning the works the supposed figures must be a little modified, and the property's value at the time of the first valuation will be greater, for instance, say 60,000 francs. There remains for the contractor a surplus value of 70,000 francs, which is the limit of his privileged right. He will receive this amount out of the selling price so far as the payment of the privileged and mortgaged debts contracted and recorded prior to the recording of this first valuation leaves an available residue; for the remainder of his claim the contractor is treated as an ordinary creditor.

It is obvious that the contractor may improve his situation by getting payments on account according to the progress of the works. The figures of the last example demonstrate this. If the instalments paid during the works have reduced the contractor's claim to 50,000 francs, this residue would have been totally paid out of the selling price of 130,000 francs, whatever may be the amount of the privileged and mortgaged debts contracted on the property by the owner after the recording of the first valuation.

It may happen that the contractor delays too long in proceeding either to the first valuation or to its recording; in the meantime the owner contracts sundry privileged and mortgaged debts on the property which the diligent creditors have had recorded. In such a case the contractor has to bear the consequences of his delay. His preferred right reckoning only from the recording of the first valuation, he will only receive the amount of his claim (limited to the surplus value resulting from the double valuation) in second or in third rank. Therefore, it is absolutely necessary that the contractor acts promptly and hurries on the first valuation and its recording.

A last case may occur. The contractor fails to have the second valuation recorded within the fortnight after the reception of the work as prescribed by the law. In this event he loses his privilege. But the Belgian Law considers the contractor's claim with such great favour that it still grants to him in such circumstances a mortgage on the property to the amount of the surplus value; this mortgage ranks from the date of its recording, which is that of the second valuation.

Although Belgian contractors are entitled under their national law to the considerable advantages aforesaid, they seldom or never make use of them. They do not appear to prize the benefits they might get from the exceptionally favourable situation available to them. They do not consider that this privilege, by reducing the risk, would allow them to decrease their prices, entailing an increase of business. They fear that such an act of elementary commercial prudence may be misinterpreted as an act of injurious and unjustified distrust, and that annoyed customers may apply to less prudent fellow-contractors. Rather than risk losing a job they prefer to risk not being paid, because they are gratuitously leaving the surplus value created by their work to be alienated to a mortgagee or shared with the ordinary creditors of the building owner if the latter should fail to meet his obligations.

That is false and short-sighted reasoning. The new circumstances produced by the war will, doubtless, induce Belgian contractors to change their old and erroneous practises, and bring them to use generally those legal means of securing their claims. After the war, at the time of the restoration of their country, Belgian contractors will be obliged to ask for great facilities and long credits from their suppliers. Certainly their good commercial and industrial reputation before the war will be a weighty element in their favour, but they will mightily increase their credit facilities by availing themselves in future of the privilege accorded to them by the law. They have at their disposal an exceptional, valuable, and easy means of getting privileged claims on immovable properties, and, consequently, of being able to assign those rights and the collateral privileges attached thereto in order to secure the payment of the materials and plant furnished to them on credit. That security is a real one; for a notice of the assignment given to the building owner and an alteration of the original recording on the register of mortgages into the name of the supplier are sufficient to prevent the contractor receiving a valid payment or the owner obtaining a regular cancellation of the inscription on the register of mortgages, and thus freeing his immovable property to the detriment and without the intervention of the supplier.

2. Concerning the Special Privileges enjoyed by Suppliers of Goods to Contractors for Works for the Belgian Government.

The privilege which has been analysed applies to public as well as to private works. But, in reality, because, in principle, public property is for the most part inalienable, and on account of the rules governing public finances and the administrative hierarchy, this privilege is of no practical value in the case of works on account of a public administration. The contractor may invoke, however, the intervention of the superior authority to act on the unable or refractory minor authority; and, as a last resort, he can have a question put to the Minister to whom the administration in default is dependent, or may summon the Minister himself, if he fails to carry out obligations arising from a contract interesting his department.

If Belgian administrations should renounce the practice they have observed for years past, of reserving to themselves the execution of all public works, and concede them to private persons or to companies, the practical utility of the privilege would reappear whenever the concessionaire carries out those works on land fully conceded to him.

But as regards public works the Belgian Code of Laws contains a second advantage peculiar to Government's works, the knowledge of which is of the greatest interest to suppliers of contractors.

The period of the French Revolution introduced into Belgium a law of 26th pluviose an II. (February 14, 1794), which has received recently a formal application by a judgment of the Belgian Court of Cassation. It confers upon suppliers of contractors of works executed, or to be executed, on account of the Government an advantage which may be called the most perfect privilege in the Belgian legislation.

This law forbids the individual creditors of the contractors for Government's works to attach the funds allocated thereto. It reserves the right of attachment to two classes of creditors only, namely, the workmen employed on those works, and the suppliers of materials and other articles for the purpose thereof. But the balance which the Government may owe after reception of the works can be attached by the other creditors, after the workmen employed on the works and the traders who have supplied the articles used on the works have been paid off.

In other words, furnishers of plant and materials destined for a determinate work done or to be done on account of the Belgian Government enjoy the enormous advantage of coming before the contractor's other creditors—that is to say, before the possessors of claims which are not directly connected with that work, and also of being able to receive in priority the amount of their bills out of the funds reserved by the Belgian Government for that work. They have the right of setting aside all attachments against these funds made pending the execution of the work by creditors unconnected therewith. They have to reckon only with attachments on the part of workmen employed thereon. And when the work is taken over, suppliers of articles relating thereto may still hinder the other creditors of the contractor from receiving the balance retained by the Belgian Government, except what remains after payment of the wages of the workmen employed and of the goods supplied to the said work.

The purveyor who delivers on credit to a contractor the necessary plant and materials for a work conceded by the Belgian Government has an almost complete certainty of being paid out of the funds reserved by the Belgian Government therefor. It is sufficient to keep a watchful eye over the progress of the work and over the payment of instalments by the Government, and, in case of a refusal to pay by the contractor, without a serious motive to apply to the proper Minister in order to stop the next instalment.

The text of this special law has in view sums owing for supplies of materials and other articles serving for the construction of the works. The expression "other articles" is general and includes money advances made in respect of such a work; the banker who opens a credit to a contractor for the execution of a Government's work is a supplier of articles in the same sense as the seller of plant and materials.

One of the consequences of this excellent law, bequeathed by the Great Revolution, and which fits so well the present circumstances, is that the Government has the power but not the obligation of requiring from the contractor evidence of payment of the workmen's wages and of the suppliers' bills. The administration of the Belgian State which has not been warned by a creditor of the contractor will make its payments in the usual manner and will not take upon itself the supplementary and unpleasant task of interfering with another's business.

If attachments have been made for reasons foreign to the Government's work, or if notice of assignments has been given, and nobody objects, the Government will pay according to the ordinary rules governing attachments and assignments, and as if the law in question did not exist. Thus it is necessary, in this as in other matters, to watch the progress of and the payment for the works, and to choose a favourable opportunity to intervene.

The following is a very characteristic example of the application of this law:—

Several years ago an Antwerp contractor became bankrupt. He left in suspense the payment of the workmen's wages and the bills of some suppliers, in respect of an inclined way leading to the elevated yards of the Belgian Government's railway in Antwerp. Payment of the balance of the contractor's accounts had not been made by the State's department. The official receiver in bankruptcy obtained settlement and received from the Government payment of the outstanding sums. The workmen for their earned wages on the said work, the suppliers of the materials used thereon, and a blacksmith for the construction and the setting of an iron railing, asked, in virtue of the law of Pluviose, for payment of their claims in preference out of the sums paid by the Government to the official receiver. Several of the contractor's other creditors, who were not interested in the undertaking for the inclined way, opposed the demand and maintained that this law did not apply; firstly, because there was a bankruptcy; secondly, because prior to the bankruptcy those creditors claiming preference did not enter a preferential claim against the outstanding balance, and did not attach it; and, lastly, because the funds had been paid to the official receiver, who acted as representative of the bankrupt contractor.

This dispute was submitted to the judgment of the three degrees of jurisdiction established in Belgium.

The Antwerp Tribunal of Commerce first, and the Brussels Court of Appeal afterwards, decided that the workmen and the suppliers had under the law of pluviose an exclusive right against the money owing by the Government in respect of the undertaking, on which they had co-operated, so long as it remained unpaid, and that the official receiver in his capacity as liquidator of the contractor's liabilities received the residue of the undertaking's price subject to the formal and special provisions of the law of Pluviose. The Belgian Court of Cassation ratified by its supreme authority those decisions on the application and the interpretation of this law.

3. Concerning Building-Owner's Right to Cancel Contract in Certain Circumstances.

Alongside of those two marked advantages the Belgian Law contains some great inconveniences for the contractors.

In consequence of an article of the Civil

Code the building owner has the right of cancelling at will a contract for a lump sum.

This provision derogates from one of the fundamental principles of law, *i.e.*, the compulsory force of a contract, as thus declared in an another article of the Civil Code: "Contracts lawfully made take the place of the law for those who have made them; they cannot be revoked except by mutual consent or for reasons authorised by law; they must be carried out in good faith."

In the first-mentioned article the Civil Code modifies this latter fundamental article. A simple act of will on the part of the building owner, whatever may be the motive, is sufficient to suppress the compulsory force of the contract for the undertaking. The contractor cannot prevent this, neither on this point have the courts power to consider the motives of the building-owner. It is enough for the latter to affirm positively his will to cancel the contract to make the cancellation binding on the contractor and on the courts. The manifestation of this will may be made at any time, before beginning the works as well as pending their progress.

This exorbitant power granted to the building-owner needed an important corrective. In the measure of possibility it was necessary to prevent the owner acting by caprice or in bad faith. Therefore, the Civil Code adds that the owner who makes use of his right of cancellation at will must indemnify the contractor (1) for all his expenses, (2) for all his works executed, and (3) for all the profits he might have made out of the undertaking.

The obligation to indemnify the contractor will cause the building-owner to think twice before acting in that way. The wide and general words used by the law to enumerate the elements of damages to be contained in the drawing-up of the statement of damages include all causes whatsoever of indemnity in relation to the undertaking thus cancelled.

Thus the words "all his expenses" comprise all preliminary expenses as well as subsequent expenses made by the contractor in view of the undertaking: studies, sounding of ground, correspondence, wages of employees and workmen, purchases of materials and plant, capital engaged, cost of survey, insurances, etc.

Similarly, the words "all his works" contain the necessary preparatory works—for instance, draining of the site, bringing to it the requisite water for the uses of the work, construction of approach ways, etc. These words apply likewise to works realising the immediate object of the undertaking, such as piles, masonry in foundations and above ground, beams, girders, anchorages, etc.

Lastly, the words "all the profits he might have made out of the undertaking" mean that without any distinction all that in the carrying out of the undertaking may yield to the contractor any profit shall be paid by the owner. Those wide expressions comprise also the moral damage arising out of the injury to the professional standing and commercial and industrial reputation of the contractor, as well as profits on materials, on plant, on wages, on capital, etc.

A first important remark ought to be made. If the owner may cancel the contract by his own will, the law declares that he may only do so on indemnifying the contractor. That means that the contract is cancelled in exchange for damages. In other words, it is only after having been paid the damages caused by the building-owner's action that the contractor ought to suffer the cancellation of the contract, deliver the work such as it stands, and disappear from the site. Until then the contract is suspended in this sense—that the contractor is no longer bound to keep on with the work; but until that time also the contract remains in force, in this sense—that the contractor retains possession of the property and also keeps the risks of the work. He is bound to carry out his obligation of yielding up the site and the works, but only in return for payment of all owing to him. He has the right to detain the property until the day of this payment.

A second observation is that those damages arising out of the cancellation of the contract of undertaking are protected and secured by the lien law analysed in sect. 1. So that if the contractor before beginning the works has taken the wise precaution of proceeding to the first valuation and to its recording, he may in case of cancellation have recourse to the second valuation and its recording. The use by the owner of his right of cancelling is tantamount to an affirmation that the works are finished. Consequently the surplus value added to the property by the works is available as subject to the contractor's lien; it may and ought to be estimated on the day the owner uses his right of cancellation.

It will be at once evident how considerable is the defence that the contractor has against the caprice or the bad faith of the building-owner. The recording of the contractor's privilege tends to induce the cancelling owner to settle quickly the account for damages, since he is interested in freeing his property from the recorded claim. The contractor is and remains over against the owner a privileged creditor for the whole amount of his claim, and he is only bound to authorise the cancellation of the inscription on the record of mortgages after payment of the last farthing of the whole sum owing to him. A variation of the privileged right of the contractor to the above-mentioned surplus value takes place in respect of the claims of the other creditors of the owner, and takes effect when, seeing the impossibility of the owner paying his debts, the property charged with the privilege has to be sold, and the proceeds thereof then fall to be divided among the creditors according to rank.

A third remark is that the article of the Civil Code limits the owner's right of cancellation to agreements for a definite fixed price. But legal writers admit and teach that the owner has the same right when the work has been undertaken for measure and value.

A fourth remark is that the right of cancelling is reserved to the owner against the contractor, and that the latter has not the same right against subcontractors to whom he may have entrusted a part of the principal undertaking.

4. Concerning the Determination of a Contract in the Event of the Death of the Contractor.

The second inconvenience for contractors is created by another article of the Belgian Civil Code, which declares cancelled by the contractor's death a contract for the letting of work (such is in Belgium the generic legal name of the undertaking contract). This article applies to both the parties, and is a derogation of the principle that heirs are bound by the debts of their author. The reason thereof is that the personal character of the contractor is one of the main motives of the undertaking agreement. And indeed the personal ability, professional skill, honesty, punctuality, solvency, and reputation of the contractor are determining reasons in causing the owner to contract.

The general imperative terms of the law "declares cancelled" seem to imply an effect produced inevitably by the death of the contractor. That is not so. The article of the code gives to the owner and to the heirs of the contractor a choice. Consequently there ought to be on one side or on the other an obvious manifestation of intention. Without that the undertaking agreement goes on, and the works are finished by the contractor's heirs or by their representative on their account. This is, after all, what happens usually.

If one of the parties bound by the contract chooses cancellation the owner has to pay to the contractor's succession the value of the executed works and the prepared materials in proportion to the agreed price, but only when these works and materials may be useful to him.

The obligation of the owner in this case is consequently determined in other manner than that of the owner who cancels the contract by his own will. The reason of this difference is simple. The law considers the contractor's death as some sort of fortuitous event giving rise to settlement of the accounts of undertaking, but not to damages. What returns to the contractor's heir is an amount proportioned to the undertaking price—that is to say, an amount to be calculated by a valuation or a comparison between the agreed price and the value of the executed part of the work. When the death happens after the contractor had already purchased the materials and plant after he had carried out the preparatory works, the return to the contractor's succession ought to be estimated according to the usefulness the purchase of materials and plant and the preparatory works may have created for the owner.

The text of the law which determines the claim of the contractor's heirs speaks of works and materials which may be useful to the owner. The word "useful" should not be understood in its ordinary sense, and limited in consequence to the obligation of the owner to pay for the works which yield a pecuniary profit, for the undertaking may have as its exclusive object an expenditure on luxury, such as decoration, ornamentation, carving, which afford to the owner in the shape of æsthetic satisfaction all that he would obtain from the contract.

It is proper to point out that cancellation of the undertaking and payment of the claim of the contractor's heir are intimately connected, and that the cancellation becomes complete only after payment of the amount due to the contractor's succession. Until then the heirs are entitled to retain the works and the site.

We may understand also all the advantage the heirs may get from the situation, when the contractor has taken the precaution to secure his privilege. Because the legal cancellation of the undertaking stops the works and fixes the rights of both parties on the day of the death, and consequently the second valuation defining the surplus value arising out of the works done up to then may be drawn up and recorded.

THE PROPERTIES OF LIMES AND PLASTERS.—I.

In the rush of modern construction those responsible for building are apt to spend but little time upon assessing the properties of their materials, often relying wholly on the standing and integrity of the firms which supply the "food" of the building trades, and many is the man who will state that he does not believe in the tests of the scientist, but prefers his own judgment based on general experience. Such an individual has probably been more fortunate than wise, for though serious troubles due to faulty materials perhaps come seldom, when they do come they are usually far-reaching in character. Now, a brick or a piece of stone or timber can be judged to a very large degree by mere inspection by any experienced person, and there is, therefore, some excuse for the attitude referred to in dealing with such substances; but when a material is presented in powder the opportunities for adulteration are so greatly increased, and the scope for tests applicable to solids in large pieces are so appreciably reduced, that no apology seems necessary for setting out the principles which underlie the proper manufacture and use of limes and plasters with which it is proposed to deal in this and following articles.

Although the expression "plaster" is used to cover a great many different substances, the term will be employed here in the more modern and restricted sense to indicate materials which have as their essential basis sulphate of lime. This definition excludes ordinary three-coat work, the composition of which will be dealt with under "Limes."

Sulphate of lime is found in transparent, well-shaped crystals known as selenite, which are common in the London clay, and are known by the clay-workers as "petrified water," but is found to a much larger extent as gypsum, which, though it has the same composition, is very different in appearance, being usually found in white masses, often showing a fibrous, silky texture. This mineral is the source of all the important plasters, such as Serapite, Keene's and Parian cements, and plaster of Paris. It is found in a remarkable state of purity for a material mined on a large scale, but is associated with small quantities of carbonate of lime, silica, magnesia, alumina, and iron. The last-mentioned is detrimental to the colour of the material, giving it a pinkish tinge.

The process of manufacture is a simple one, and consists of crushing and grinding the mineral, which is not hard, but has a peculiar toughness due to its fibrous nature, and then heating it to expel not only moisture but water present as an essential in its composition.

As an understanding of all materials which "set" is impossible without an appreciation of this "water of crystallisation," as it is termed, a few words on this subject are essential. Many mineral and prepared chemical substances when deposited in the solid form by evaporation of a solution of such bodies in water appear in regular forms with bright flat faces, making definite angles with one another—crystallised sugar is a familiar example—and in many but by no means all cases the substance in crystallising takes up water, not as a liquid entangled in its pores, but as a part of its composition, definite in amount and essential to its shape and many of its other properties. Such "water of crystallisation" combined with the compound in a solid condition is usually expelled fairly easily by heat, when the substance loses its regular shape and falls to powder. In some cases the whole of this water is equally readily expelled, but in others the last portion of it is so firmly held to the rest of the material that it can only be removed at a high temperature or by complete decomposition of the substance proper. When a material which has this tendency to combine with water is deprived of it—that is, dehydrated—it usually tends to absorb water when mixed therewith or placed in a moist atmosphere; and, if the amount of water is sufficient, this absorption will be attended by a recrystallisation of the material, a very important feature of this process being the increase of bulk with which this is generally accompanied. The above facts form the basis of the usually accepted theory of the "setting" of plasters, limes, and cements, and, though the explanation is not universally accepted for the last two classes, it is so as far as plasters are concerned.

To return to the formation of plasters from gypsum. After the mineral has been ground it is heated to a temperature somewhat above that of boiling water, namely, to between 330 deg. Fahr. and 395 deg. Fahr., which must be carefully regulated, because the operation is designed to expel not the whole but only three-quarters of the water of crystallisation contained. Chemically gypsum consists of calcium (a metal), sulphur, oxygen, and water, and is represented by the formula $CaSO_4 2H_2O$, and the expulsion of water as follows :—

$$2\,(CaSO_4\,2H_2O) = \begin{matrix}CaSO_4\\CaSO_4\end{matrix}\!>H_2O+3H_2O \text{ (water expelled),}$$

and the substance formed is known as plaster of Paris.

The operation is conducted usually in large iron cylindrical vessels, known as "kettles," which hold six to as much as twelve tons of gypsum, the larger sizes being some 8 ft. high and 10 ft. in diameter. Heat is applied gradually while the material is fed in, and, as much moisture is always present (apart from the water of crystallisation), the material becomes liquid and boils at a temperature but a few degrees above that of water. When this moisture has been expelled the substance settles down and becomes solid, but boils again as the temperature rises and the combined water is removed. When three-quarters of the combined water have been expelled, the liquid is allowed to run out and solidifies as plaster of Paris. Sometimes rotary plants are used somewhat similar to those employed for cement making, but on a smaller scale, in which case the grinding generally follows the calcining process.

What has been said above refers strictly to the treatment of very pure forms of gypsum, but for many purposes plaster of Paris thus formed is too brittle and quick-setting, and for wall surfaces gypsum containing some natural impurities which modify the properties of the plaster is employed or ingredients in very small quantities are added. To decrease the rate of setting, powdered glue or other organic substance, to the extent of a few pounds per ton, is usually added, which is best done after the gypsum has been calcined and cooled, with the aid of a mechanical mixer.

Keene's Cement.

Among the many hard plasters formed by adding ingredients to burnt gypsum, Keene's cement may be cited as by far the most important. In this case the mineral is heated in small kilns to a red heat, being thus deprived of all its water of crystallisation, and a very pure gypsum is required for this manufacture. The lumps of calcined mineral are then immersed in a solution of ordinary alum (about ten parts of alum to ninety of water), dried and again heated to redness, when it is cooled and finely ground. Keene's cement (which should be called "Keene's plaster," for cements belong to a different category) sets comparatively slowly, and until nearly hard can be knocked up again and re-used without detriment, a fact which is not generally recognised, and might often be taken advantage of when errors or alterations occur and the necessary changes can be made while the work is still "green."

Flooring Plasters.

Considerable use has been made in Germany, though not much elsewhere, of the fact that gypsum when heated to a temperature above 400 deg. Fahr. and ground, forms, when mixed with water, a plaster which sets slowly but develops great hardness, so much so that it can be used as a flooring surface. The usual belief is that if gypsum be heated until the whole of its water of crystallisation is expelled, it becomes "dead burnt," and is incapable of setting at all on the addition of water. But the true facts appear to be that if gypsum is heated for a limited time to a moderate temperature, say, 400 deg. Fahr. to 500 deg. Fahr., although the whole of its water is expelled it will set with water slowly to a very hard solid, but should the heating be very long continued or performed at a very high temperature it really does become "dead burnt," and will not then set at all.

Flooring plasters should be used on a good foundation, which will allow them to dry evenly, and must not be exposed to moisture when hardening. Properly laid they form a very durable surface. They may be used mixed with inert aggregates, such as sand, but only with a degradation in quality in proportion to such aggregate added.

Properties of Plasters.

But little difference will be apparent in the general appearance of many plasters in the state of powder, though freedom from colour is an obvious quality to be sought for many uses. The presence of glue or other organic "retarder" may be surmised by heating a little of the material by means of a smokeless flame upon, say, a piece of clean sheet-iron, when the charring of such matter will produce a greyish tint in the powder. Similarly any iron compounds will, under a like test, produce a pinkish tinge due to the formation of red oxide of iron. As the actual compositions vary so slightly, analysis by an expert chemist is required to detect most other possible ingredients.

In the case of Portland cement, specific gravity—that is, the weight of the material, bulk for bulk, as compared with water—is, of course, a most valuable guide to its character, and, though tests are seldom made on plasters, it may be useful to state that the true specific gravity of plaster of Paris is about 2·57 (*i.e.*, it is very slightly more than two and a half times as heavy as water), and as measured in powdered, in the manner which would be adopted in using a cube foot box after the style of the old "striked bushel," the specific gravity is about 1·8 or 113 lb. per cubic foot. These figures will vary but very slightly for all the true plasters which will be described.

As to fineness, if 70 per cent. of the plaster pass through a sieve containing seventy-four holes per lineal inch, or 50 per cent. through a 200-hole sieve, the result may be regarded as satisfactory. In making this test it is hardly necessary to point out that the sieve and material must be carefully dried to prevent any clogging.

The strength of plasters is not a subject which usually receives any attention, but the following summary of facts culled from experiments should be of value :—

Plasters attain almost their full strength after about a week from laying, but the increase takes place slowly up to about a month. When mixed with inert material such as sand, the strength added after a week is much less than when they are used neat.

The tensile strength of neat plaster may be as much as 400 lb. to 500 lb. per square inch. Sand much reduces this strength, and plaster and sand 1 to 3 may have but little more tensile strength than 100 lb. per square inch. The adhesive strength of neat plasters to a smooth brick surface should be about 60 lb. to 80 lb. per square inch after a week, increasing to something over 100 lb. in a month.

◆

ELECTRIC LIFTS.

MR. H. MARRYAT, M.Inst.E.E., read a paper on "Electric Lifts" at a meeting of the Association of Supervising Electricians on December 14, in the course of which he said :—

"I propose to deal only with the usual types of lifts found in domestic and business premises in London, to indicate the chief points which go to distinguish a good lift from a bad one, and to give you a few practical hints upon upkeep and maintenance.

It is only in the case of service lifts, where no person can travel with the lift, that the factor of safety both as regards the strength of materials and number of safety devices can be properly reduced. No matter for what purpose the lift may have been constructed—it may be for conveying coal, or flour, or what not—if the car is large enough for persons to travel by, then sooner or later it will be used for that purpose. Bearing this in mind, all such lifts should be constructed to be as safe as the ordinary passenger lift. When a lift is constructed without this full margin of safety, then the car should be either too small for a person to enter or so fitted with fixed shelves as to make this equally impossible. My experience is that no form of notice or warning is sufficient to prevent a man risking his life if it will save him a little stair or ladder work.

Leaving on one side a number of special and eccentric designs, and taking no account of an equal number of monstrosities, lifts may be broadly divided into two classes—that is to say, sheave-driving lifts and drum-driving lifts.

Each of these classes may be again divided into top-gear lifts and bottom-gear lifts—that is to say, lifts in which the gear is situated at the top of the well, immediately over the car, and lifts in which the gear is placed elsewhere; for, although with bottom-gear lifts the machine is usually situated at the foot of the well, it is not necessarily so placed, but for convenience may be fixed upon any floor, and for special reasons it is sometimes placed more or less remote from the lift well, the ropes being led from the driving sheave or drum to the car and counterweight by means of guiding sheaves.

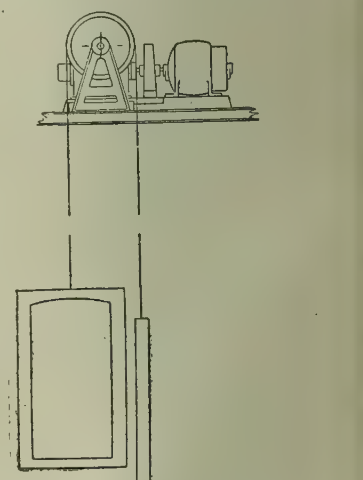

Fig. 1. Diagram of top gear lift arrangement.

All these lifts work upon the see-saw principle. Not only are the car and the attendant, if any, fully counterweighted, but also a proportion—usually 40 per cent.—of the maximum load. Under these conditions, the lift descending empty will take almost as much power as when ascending fully loaded, and exactly the same power as when ascending with 80 per cent. of full load. On the other hand, with an average load of 40 per cent. of full load it will take practically no power either ascending or descending. It is this system of counterbalancing part of the load which secures for the electric lift its extraordinary efficiency.

Comparing electric with hydraulic lifts, the first cost is very much the same. A completely automatic electric lift may cost a little more than an ordinary hydraulic lift, but no attendant is required with the automatic lift, whilst one is needed in the other case. In the running costs there is little ground for comparison; the electric lift, properly constructed, costs less all the time. With a hydraulic lift the quantity of water used is the same whether the car be fully loaded or quite empty—in fact, no matter what the load may be; but, as we have seen, an electric lift will carry its average load at practically no cost.

Mr. H. C. Crews, M.Inst.E.E., in a paper read in 1906, analysed the energy cost of a large number of electric and hydraulic lifts. The conclusion he arrived at showed that electric lifts cost less than a quarter as much to run as did similar hydraulic lifts. Some of his examples, taken separately, showed more favourable results, and my own experience is that modern electric lifts cost for electric current about one-tenth of the water bill for similar hydraulic examples. When carefully balanced the energy for starting and accelerating an electric lift exceeds that of the actual running, so that a skilled attendant will effect great economy over an unskilled one, who will sometimes make two or three shots before attaining floor level. In this respect a push-button automatic lift gives a maximum of economy, because it only makes one start for each journey and automatically finds its own floor level.

We have a very useful practice in my own firm, which I have never noticed elsewhere, of applying counters to the controllers. These counters register the number of journeys made—that is to say, the number of times the motor is started and stopped. With an automatic lift each journey must be at least the distance from one floor to another, and will average about half the full travel of the lift.

As further corroboration of the extraordinarily low running cost of electric lifts, the Chief Engineer of the Westminster Electric Lighting Company informs me that in respect of fifty electric lifts operating in their district, the current consumption for the past twelve months has been 53,000 units, or only 1,060 units per lift per annum. The car lights, taking a considerable amount of energy, are usually included with the energy cost for the lift.

With regard to the important item of maintenance cost, the balance is again in favour of the electric lift. A hand-rope or car-switch lift operated by an attendant, which is the only type of lift which may be fairly compared with a hydraulic lift, will cost 25 per cent. less to maintain than its hydraulic equivalent. A completely automatic electric lift will cost no more to maintain than a hydraulic one, with the additional economy of the attendant's salary, which in itself will be about five times the total maintenance cost. When a hydraulic lift has to be taken out of a building for any reason its scrap price will hardly pay for the cost of removal, whereas, on the contrary, in the case of an electric lift there is no difficulty in adapting it for another position. If I have seemed to dwell rather long upon this matter of comparison between electric and hydraulic lifts, it is because many of you must be frequently asked to express an opinion on this very question, in which case I hope you will find these facts and figures useful.

A matter which is very distinctly within the province of the supervising engineer is the adjustment of lift counterweights. As supplied by the makers, the counterweight consists of a wrought or cast iron frame made up to about equal the weight of the car, and a number of cast-iron slips with which a suitable balance to the average load may be made up.

The manufacturer, not knowing what the average load is going to be, has only the maximum load specified in the contract to guide him, and he usually assumes the average load to be 40 per cent. of full load, and balances accordingly. After the lift has been got to work for some time this estimate may prove to be quite wrong. The owners, in their anxiety to be on the right side, may have specified a maximum far in excess of probable requirements, or, for the sake of economy, they may have specified it so low that the average load carried is very nearly the maximum the lift is designed for. This often happens in the case of goods lifts.

Let us suppose that two quite similar lifts have been erected, but that one is balanced for a maximum load of 5 cwt.—that is to say, 2 cwt. of load counterbalanced—and that the other is balanced for a maximum load of 20 cwt., in which case 8 cwt. of load would be balanced. Now, it is quite possible that the actual average load in both cases will be that of two persons, or, say, 250 lb. The 20 cwt. lift will cost practically nothing to take its two passengers up, as current will only be required to release the brake and start the machine. The counterweight then takes control and does the rest. On the downward journey, however, provided the two passengers are so kind as to use the lift, 896 lb. of counterweight must be raised against a load of 250 lb., making a nett weight of 646 lb. to be raised. If the passengers prefer to walk down instead of using the lift, as they sometimes do, the weight to be raised before the car is at the ground floor ready for the next trip is 896 lb. Taking the up and down journeys together, the average work done is equivalent to raising 323 lb. if the passengers use the lift coming down and 448 lb. if they do not.

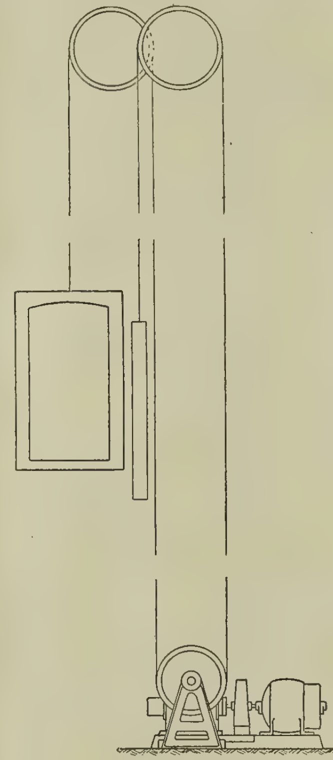

Fig. 2. Diagram of bottom gear lift arrangement.

Compare these figures with the results obtained from the other lift. In this case the difference between weight of counterbalance and the actual average load is only 36 lb., the load consisting of two persons being the heavier. On the upward journey 36 lb. has to be raised, and on the downward journey the load will take control, and practically no current will be drawn from the mains. If the passengers elect to walk down, 224 lb. has to be raised to bring the car to the ground floor. Taking the up and down journeys together again, we find that the work done is equivalent to 18 lb. raised in the one instance and 121 lb. in the other. So that if the passengers use the lift on the downward journey the current consumption of the lift balanced for 20 cwt. maximum load will be eighteen times as much as the other, and if they walk down it will be four times as much. The result of a day's work upon these two lifts will show that the one has run the meter up about ten times as much as the other.

You may accuse me of having taken an extreme case. I have done so purposely to prove the principle which is true of all lifts, and I can point to actual economies of 50 per cent. and upwards which have been effected by attention to the correct counterweighting of lifts to the average load, which, it must be remembered, is a factor which can only be discovered after the contractors have erected the lift and handed it over to the owners. In fact, it is a matter essentially for the supervising engineer to know something about, and to watch in the interest of his employers. The adjustment is effected by adding to or removing from the counterweight a suitable number of the cast-iron slips supplied with the lift by the makers. By adjusting the counterweight in this way to the average load the fact must not be overlooked that the maximum lifting power may be reduced; but this is frequently of small consequence compared with a large saving of the annual current bill. Before proceeding to describe the various parts which go to make a lift it will be well perhaps if I say a few words as to the relative advantages of top and bottom gear lifts.

Architects often exhibit a regrettable disregard for the requirements of the lift engineer, who frequently finds no adequate provision for placing the lift gear, and is often met with obstructions in the lift well, such as pipe-runs or set-offs in the brickwork, which might have been avoided, and which can only be circumvented with the greatest difficulty. The question of a pit—an essential if a lift is to serve the basement level—is frequently overlooked, and drains are run beneath the well, so that no proper pit can be constructed. The result is often a compromise, and a pit which should be 30 in. deep is reduced to 18 in., a condition which is unsatisfactory in the extreme, and often dangerous. For no other reason than the architect's oversight, many lift gears are fixed in positions involving considerable expense in installation and so much difficulty in subsequent maintenance that the work is never properly done.

The best place for a lift gear is at the top of the well, immediately over its work. Here the maximum of efficiency is attained and the number of parts to be maintained is reduced to a minimum. In this position the length of the ropes is only one-third that of the ropes for a similar lift, if the gear be fixed at the foot of the well. As rope renewals form the most expensive part of the upkeep of a good lift, this is a matter well worthy of consideration. A properly-constructed weather-proof room of ample dimensions and easily accessible should be provided in which to house the gear. If a top-gear lift is to serve the top floor, this house must be built upon the roof. The only objection to the gear being fixed at the top of the well arises from the possibility of noise and vibration being transmitted to the rest of the building. This difficulty should be met by good engineering and sound architecture. It is of primary importance that the lift gear should run noiselessly and free from vibration, and it is only upon the assumption that sufficient excellence in this direction is unobtainable that any argument can be found for placing the gear at the foot of the well, in which position a firm foundation and isolation from the rest of the building is more readily obtained. To prevent the transmission of noise and vibration to the building the bedplate may be anchored to a block of concrete of ample weight, which, in turn, is bedded upon sand and isolated from walls and footings by more sand. A thin cover of soft asphalt may conveniently be used to cover the sand surrounding the concrete bed.

In modern buildings of steel construction the difficulties arising from this source are greatly enhanced, and in such cases, supposing absolute quiet to be essential, every possible precaution must be taken to ensure that no rigid connection exists between the gear and the building."

The remainder of an extremely interesting paper, which we regret we have not space to give, was taken up by a description of the various parts of a lift, a subject for experts rather than architects.

BUILDING MATERIAL PRICES.

IN revising our prices for the first week of the New Year we thought it might interest our readers to give a table comparing these with the prices issued in our New Year's Number for 1915, thus showing at a glance the effect the war has had on the principal materials used in the building trades.

BRICKS, ETC.	Advance Price £ s. d.		Approximate Increase Per Cent.
Stocks Bricks	0 3 6	per 1,000	10

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Bedford.—Plans passed by the T.C.:—New workshop, for Wynward Cycle Company, St. Cuthbert's-street; iron roofs, for Mr. Atterbury, 2, Becket-street; iron roofs, for Mr. F. Corby, 62, Beaconsfield-street; lavatories, Electricity Works; covered shed for boiler, for Bedford Fire Brigade; and extensions, lavatories, etc., for Mr. J. A. Hague, Mill-street.

Bentley.—The L.G.B. has held an inquiry into the application by the U.D.C. for permission to prepare a town-planning scheme.

Bradford (Wilts).—Approval has been given to plans by Mr. W. T. Marsh for the conversion of No. 1, Trowbridge-road into two houses.

Exhall and Foleshill.—The directors of the L. and N.W. Railway Company have in contemplation the carrying out of an important scheme for extensions of siding accommodation on their Nuneaton and Coventry branch at the Hawkesbury-lane and Longford and Exhall stations.

Finchley.—Plans passed by the D.C.:—Additions, "Homewood," Cyprus-avenue, Mr. A. H. Hale; four houses, Lyndhurst-gardens, Mr. J. C. Williamson; soil and surface-water sewers, Ringway, connected with Addison-way, Copartnership Tenants, Ltd.; motor garage, etc., Westbury-road, Mr. A. Pirie; motor garage, "Laleham," Dollis-avenue, Mr. W. M. Shanley; three houses, Fallowcourt-avenue, Mr. A. Dowdall.

Glasgow.—At Glasgow Dean of Guild Court recently linings were granted to Messrs. Carsons, Ltd., chocolate manufacturers, 49, Solway-street, to add to their works there; Messrs. J. & T. Boyd, Ltd., engineers, to extend their premises in Old Shettleston-road; the Glasgow Eastern Co-operative Society, Ltd., 34, Dalmarnock-road, to alter buildings in Westmuir-street.

Halifax.—At a recent meeting of the T.C. the Council was asked to apply to the L.G.B. for their sanction to the Corporation borrowing £5,558, the additional cost in connection with the purchase of plant required for the electricity works. Also to sanction a proposal by the Waterworks Committee to lay 550 yds. of main from Mixenden Reservoir to the works of Mr. J. W. Bulmer, Hays Mill, Mixenden, at an estimated cost of £500. The Improvement Committee have resolved that the Town Planning Sub-committee be appointed to confer with the Sub-committee appointed by the Health Committee on the question of a housing scheme and report.

Hendon.—The Town Planning and Building Applications Committee has given its approval to the following:—Cottage flats, Erskine-hill, Mr. A. F. Garrow; house, Rotherwick-road, Mr. F. W. Bristow; boiler house, Renters-avenue, Hendon, Messrs. Johnson's Manufacturing Chemists; hangar, Booth-road, London and Provincial Aviation Company; out-buildings, Schweppes' Factory, Hendon, Messrs. Schweppes; additions, Hendon Hall, Hendon Hall, Ltd.; motor house, 1, Goodwyn-avenue, Mill-hill, Mr. E. J. Clarkson; tool and bin house, Meadway-court, Co-Partnership Tenants, Ltd.

Henley.—The Council has passed plans for motor garage in Rivermead-road, for Messrs. Hobbs & Sons, Ltd.

Leamington.—Alterations and additions are to be made to the Warneford and South Warwickshire Hospital, Leamington, to provide fresh accommodation for the X-ray and electrical department, which is at present at the basement of the premises. The present nurses' sitting-room is to be converted into the new X-ray department, and a new nurses' wing is to be built. The annexe to the nurses' home will cost £900, and the X-ray and electrical installation £300.

Malvern.—At a recent meeting of Worcester E.C., held to consider what accommodation should be secured for Worcester children in the open-air school at Malvern, it was reported that guarantees had been given by city gentlemen to the amount of £500, to provide an extension of the school.

Manchester.—The City Council propose to spend £79,000 on new works at Longdendale, to afford protection from damage through floods, and to increase the storage capacity of the reservoirs. The Trafford Park Estates, Ltd., propose to construct light railways from Trafford Park to Lostock, passing through the parish of Davyhulme and the urban district of Stretford.

Mutford and Lothingland.—The R.D.C. has accepted an estimate for certain drainage work at Bradwell.

---

* See also our list of Competitions Contracts, etc., on page 38.

Newcastle.—The Town Improvement Committee has approved plans for the erection of a new picture hall in Back-street, Newcastle.

New Zealand.—H.M. Trade Commissioner in New Zealand has forwarded extracts from the local Press, from which the following particulars are taken:—The ratepayers of Auckland have authorised the municipal authorities to raise a loan of £115,000 for the purpose of carrying out the following works:—Erection and equipment of market buildings, £55,000; establishment of a fish market, £20,000; water supply in Grey Lynn, £10,000; construction of drainage works at Remura, £30,000.

Northampton.—The T.C. has approved plans of three new houses (King Edward-road and Cedar-road).

Ripon.—The City Council has decided to proceed with the erection of six additional fresh water baths at the Spa Baths, costing £250.

Ruskington.—The U.D.C. has passed a plan for a new dairy (Mr. W. H. Silson, Manor-street).

St. Germans.—The R.D.C. has passed plans for a bungalow at Anderton, for Miss Llewellin.

St. Ives (Cornwall).—The T.C. has approved of a plan presented on behalf of the Salvation Army of premises proposed to be erected at the New Pier.

Southend.—Plans approved by the T.C.:—One bungalow, Marguerite-drive, Mr. T. W. Cook; one bungalow, Hamstel-road, Mr. J. J. Going; three houses, North-avenue, Mr. F. H. Farnborough; house, stable, and cowshed, Southbourne-grove, Mr. T. Coates; alterations and additions, 40, Prittlewell-street, Mr. C. Floyd; one bungalow, Blenheim-crescent, Mr. S. Sharp; two bungalows, Marguerite-drive, Mr S. C. Arnold; alterations, "Mornington," Drake-road, Mr. P. J. Hobbs; additions, "Clovelly," Fermoy-road, Mr. T. Blackall; lantern loft, church of St. Paul, Summercourt-road, Rev. A. Waller; two bungalows, Leigh Hall-road, Mr. H. Bridge; alterations to roof, 44, Clarence-road, Messrs. Tolhurst & Cozens; roadway off East-street, Great Eastern Railway Company.

Staines.—The R.D.C. has approved a plan from Mr. Evans, of Cranford, for two cottages in Tentlow-lane, Cranford.

Sunderland.—A plan has been approved by the Corporation for the building at Holmeside of a block of seven shops, with billiard-rooms above and at the back. They are to be erected for a Newcastle firm having billiard saloons in several centres in the north-east district.

Uxbridge.—The U.D.C. has approved plans for flour store at 3, Cowley-road, for Mrs. F. Davis.

York.—The Streets and Buildings Committee of the York Corporation has approved of the following plans:—Mr. W. C. Oliver, temporary shed, Priory-street; Rev. P. J. Shaw, temporary shed, 28, Tanner-row; Mr. T. Morris, temporary shed, Escrick-street; Mr. A. Danby, temporary shed, 18, Hawthon-street; Yorkshire Insurance Company, Ltd., lavatory, St. Helen's-square; Mr. G. E. Barton, alterations to stables, 25, St. Mary's; Miss Milner, motor garage, Heworth Moor House, Heworth Green; Messrs. T. Cooke & Sons, Ltd., sheds, Cromwell-road; Mr. T. Belt, combined drainage, 28, 29, and 30, Charles-street.

GENERAL BUILDING NEWS.

EMPIRE, CARDIFF.

The Cardiff Empire has recently been opened after reconstruction. The front of the building in Queen-street is of Portland stone. The central openings lead into a porch, the walls of which are lined with Welsh marble, and then by a staircase to the waiting halls. The auditorium is divided into fauteuils, stalls, and pit stalls. Above is the grand circle, and above that the balcony and gallery. There are 1,200 tip-up chairs on the ground floor. There is accommodation in the grand circle for 500, seats for 570 in the balcony, and for 550 in the gallery. The private boxes occupy the usual side positions and extend right round the grand circle. Messrs. William & T. R. Milburn, Sunderland, are the architects, and Messrs. Turner & Sons, Cardiff, chief contractors.

NEWCASTLE-ON-TYNE CITY LUNATIC ASYLUM.

The last of the buildings forming the recent extension of the Newcastle City Lunatic Asylum has just been handed over. They comprise two villa blocks for forty patients each, nurses' home for fifty-six, and an isolation hospital for six patients. The villa blocks are built of brick walls faced with Lowry's Pensher pressed bricks; there is a half-inch cavity behind the outer facing filled in vertically with Callender's Bitubond. The walls of nurses' home and hospital are of stone; all the roofs are covered with Port Dinorwic slates, floors of Fawcett's Monlithcrete system, woodwork of deal and stained (part with Solignum); the plastering is of Victorite except the hospital, which is Albine cement; the ground floors are of pitch-pine boards and upper floors of deal blocks; heating is by hot water with radiators

RATES OF WAGES IN THE BUILDING TRADE.

The following are the present rates of wages in the Building Trade in the principal towns of England and Wales. It must be understood that, while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur:—

—	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Masons' Labourers.	Bricklayers' Labourers.	Plasterers' Labourers.
	d.	d.	d.	d.	d.	d.	d.	d.	d.	d.

The masons' rate given is for bankers; fixers usually ½d. per hour extra.

and pipes; the bathrooms, lavatories, and water closets have "Marmette" dadoes and floors of "Flintine" tiles; the stair steps and landings are of Yorkshire stone from Messrs. John F. Shackleton & Son, of Goole; internal partitions of Hemel Hempstead partition blocks; the upper windows of nurses' home have sashes hung on Hall's pivots. The general contractor was Mr. Alex. Pringle, of Gateshead, and the various subcontractors were:—Slating, Messrs. Beck & Son, Newcastle; plumbing, Messrs. Allinson & Son, Gateshead; plastering, Mr. W. Ryan, Gateshead; painting, Messrs. Merrillees & Denton, Gateshead; heating engineers, the R. J. Ward Company, Newcastle; radiators and boilers, the National Radiator Company, Ltd., Hull; wood block floors, Messrs. E. Burgess & Co., Liverpool, and Turpins Floor Company, London; sanitary fittings, Messrs. Doulton & Co., Ltd., Paisley; fires and mantles, Messrs. Doulton & Co., Ltd., Lambeth; Messrs. Emley & Sons, Ltd., Newcastle, and Messrs. Henry Walker & Son, Ltd., Newcastle; iron balusters and railings, Messrs. M. Aynsley & Sons, Ltd., Newcastle; locks and hardware, Messrs. N. F. Ramsey & Co., Newcastle; asphalt paths and roads, Mr. W. T. Wallace, Newcastle; mosaic dadoes, the Art Pavements and Decorations, Ltd., London; electric light, telephones, and telltales, Messrs. Robson & Coleman, Newcastle; boot lockers and racks, the Crittall Manufacturing Company, Braintree; fire hydrants, Messrs. J. Blakeborough & Sons, Brighouse; verandahs covering, Messrs. Pilkington's wired cast plate glass. The buildings were designed and the erection superintended by Mr. John W. Dyson, architect, Newcastle, with Mr. George Cousins as clerk of works. The whole Asylum has been taken over by the Military, and is now the Northumberland War Hospital.

TRADE NEWS.

St. Mary's Church, Berwick-on-Tweed, is being ventilated by means of Shorland's patent exhaust roof ventilators, supplied by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester. The East Cramlington P.M. Church and Schools, Northumberland, are being supplied with the firm's patent exhaust roof ventilators.

Messrs. Pilkington & Co., Polonceau and Seyssel Asphaltes, Deptford Wharf, 190 and 192, Creek-road, Deptford, S.E., have taken new offices at 17-18, Railway-approach, London Bridge, S.E., and they will be glad if all communications are sent to that address after the 18th inst.

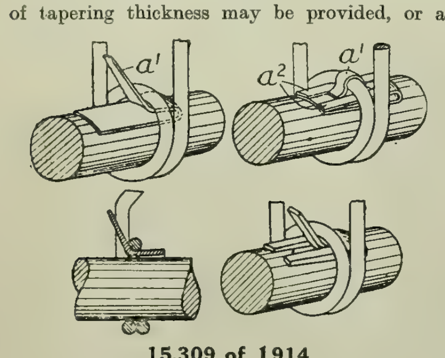
We are informed that the lining of a 40,000 gallon reservoir in Bristol has been made perfectly watertight by the use of the waterproofed cement rendering Pudlo.

◆

SELECTED PATENTS.

15,309 of 1914.—British Reinforced Concrete Engineering Company and Amos George Bullivant: Reinforced concrete.

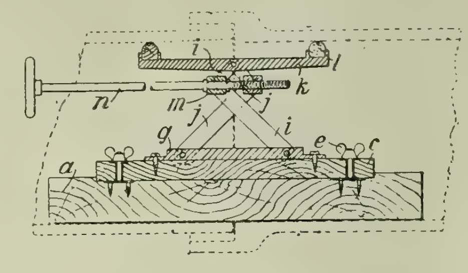
This relates to reinforced concrete in which stirrups or shear members are secured to the main bars by means of cotters passed between the bar and the loop of the stirrup and bent to prevent accidental withdrawal. The cotters may be formed by doubling a strip of metal; the tapered end a^1 is bent up after the cotter is driven in, but the central tongue a^1 or the two side tongues a^2 are bent up before being driven in and then bent down. A small cotter of tapering thickness may be provided, or a cotter of uniform thickness but tapering in width, the narrow end being bent up and the broad end curved transversely so that the edges bear on the bar.



15,309 of 1914.

15,332 of 1914.—Henry George Nicholson-Lailey: Pipe aligning instruments.

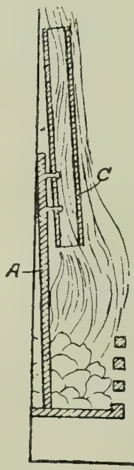
This relates to a device for aligning pipes comprising a base *a* adapted to extend across the joint, and a member *k* capable of slight rocking movement and adapted to be moved away from the base to bear against the upper inner surfaces of the pipes, so that true invert is secured and inequalities of the pipes are brought to the upper side. The member *k*, provided with projecting blocks I, is carried by two sets of toggle-levers *i*, *j* pivoted to a bar *g* secured to a plate *c*. This plate is detachably secured by wing-nuts *e* to a base *a* suited to the size of pipe, the under surface of the base being curved to fit approximately the inner surfaces of the pipes. The levers *i*, *j* are operated to produce relative movement of the parts *a*, *k* by a rod *n* passing through bushes *m*, one of which is threaded to work along a corresponding thread on the rod.



15,332 of 1914.

15,855 of 1914.—Alice Mary Chambers: Fireplaces.

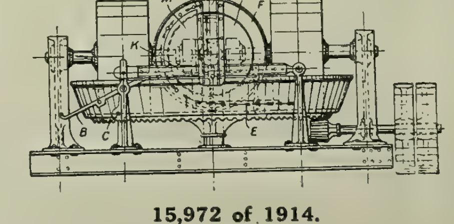
This relates to a device to prevent down-draught in open fireplaces, comprising a short length of metal piping C supported above the fire so as to be heated thereby. It may be attached to a prop A or to the back-plate of the fireplace, or otherwise supported, and may be formed with keyhole slots to take over fixed studs.



15,855 of 1914.

15,972 of 1914.—Edouard Van Montgau: Delivery devices for mortar mills.

This relates to delivery devices for mortar mills or mixing-machines operated by the rotation of the pan. Over the pan are mounted a rotary disc A with an annular channel F and a fixed plate M carrying blades E, H. The blade E directs the material into the channel F, which raises it to the blade H, by which it is directed to a shoot. The device is mounted on a pivoted frame K so that it can be lowered on to the pan, when the disc A is rotated by the motion thereof, or raised to put it out of action. The frame K can be held in its raised position by means of a lever B and pin C.



15,972 of 1914.

OBITUARY.

Lieut.-Colonel Greenwood.

The late Lieut.-Colonel Joseph F. Greenwood, of Bartram's Park, Hampstead, who died on December 27 at the Horse Guards, was an architect and a Fellow of the Surveyors' Institution. In April, 1907, he was appointed a Superintending Inspector of Works R.E. Staff, and in last August was gazetted honorary lieut.-colonel. In spite of increasing ill-health he remained at his post to the last. His eldest son, Lieut. J. F. B. Greenwood, 1st Royal Lancashire Regiment, fell at St. Julien, near Ypres, on May 3 last.

Lieut. E. K. Smith.

The death, on December 22 in Flanders, is announced of Second-Lieut. Ernest Kennedy Smith, aged twenty-three years, of the 1st East Kent Regiment, to which he was gazetted in last July. He was the eldest son of Mr. W. Macdonald Smith, of Onslow-gardens, Muswell Hill, and was educated at Dover College and Highgate School. He was a promising architect, and achieved high distinction in the Association Schools. He enlisted in September, 1914, and joined the Artists' Rifles.

Mr. W. J. Saville.

We regret to announce the death, which took place at Rugby a few days ago, at the age of fifty-six years, of Mr. Walter John Saville, who for many years had been associated with the firm of Messrs. Foster & Dicksee, builders and contractors. Mr. Saville was the Rugby manager and was also on the board of directors. He was a well-known surveyor. Until recently he was chairman of the Rugby Master Builders' Association and also chairman of the Rugby Benefit Building Society.

Mr. A. Hughes.

The death, on December 22, at his residence, East Side House, Kew Green, is announced of Mr. Arthur Hughes, aged eighty-three years, the last of the Pre-Raphaelite painters. In 1896 he entered the School of Design, in Somerset House, where his first master was Alfred Stevens, and a year later was admitted to the Royal Academy Schools. At the age of seventeen he sent his first picture, "Musidora," to the Royal Academy rooms, and three years afterwards his "Ophelia" was exhibited there, together with Holman Hunt's "Hireling Shepherd" and Millais' "Huguenot" and "Ophelia." His "Ophelia" was bought, upon Rossetti's instigation, by McCracken, of Belfast; for Mr. Plint he painted the "Nativity" (in the R.A., 1858), "Annunciation," and "Long Engagement"—which three pictures now belong to the Birmingham Corporation. With Rossetti, Morris, and Burne-Jones he shared in the decoration of the Union Society's rooms, Oxford, for which he painted, in tempera, the "Passing of Arthur" and the "Return of the Sword 'Excalibur' into the Lake"; in the Ashmolean Museum is his "Home from the Sea." Mr. Hughes was a constant contributor to the exhibition of the Royal Academy and the Grosvenor and New Galleries during a period of thirty years—to the first-named he sent, in 1856, a triptych, "The Eve of St. Agnes," as inspired by the poem of Keats; and shortly afterwards his "April Love," now in the Tate Gallery, Millbank. He illustrated the works of Christina Rossetti, the poems of William Allingham and George MacDonald, and Hughes's "Tom Brown's School Days." He received a Civil List pension three years ago. In 1855 he married Miss Tryphena Foord; his two sons and a nephew, Mr. E. R. Hughes, are artists.

Apotheosis of Marcus Aurelius: Relief from Ephesus.

APOTHEOSIS AND AFTER LIFE.*

ROMAN art has come to its own at last; but it may safely be said that until now its connection with Roman religious beliefs, though foreshadowed by Della Seta, has never yet been exhaustively examined. Mrs. Strong, in her introductory address, criticises those students who would see in Roman art a mere local development under Oriental influences, by showing in the first place that from the time of Augustus Rome's position as a centre of artistic activity ranks her with Alexandria, Antioch, and Seleucia; in the next place that, as recent excavations show, Rome, long before the days of Augustus, was in possession of a vivid and distinctively national art, derived, it is true, from Ionia, but vigorous and independent nevertheless. Mrs. Strong protests in eloquent words against the folly of treating the Roman achievement as a foil to the Greek, and shows how both are but part of a great single movement, the antique. Greek art came to Rome not to die but to live, and to inspire the local Ionicised art with new life; and, with regard to the specific contribution of Rome to the antique, no conception of art which produced architecture of the highest order—the Pantheon, the Pont du Gard, the Baths of Caracalla and Diocletian—can be dismissed as second-rate or imitative. We may pride ourselves on the fact that England more than any other country has found inspiration for her own best work of the domestic and civic order in the study of Roman art. It was not for nothing that Chambers and the Brothers Adam worked in Italy, nor was there any antithesis felt between the work of Stewart and Revett on Athens and that of Adam on Diocletian's palace at Spalato. That great conception of the antique caused union among scholars, not division, until the fuller revelation of Greece caused Roman art to be looked on in the light of her worst features—those decorative copies of older works which have caused both Greece and Rome to become a weariness of the flesh to those who were taught to see in them the culmination and not the pale shadow of ancient art.

The unique position of the emperor restored to Roman art what had been lost in the greatest days of Greece—the importance of the central figure as a motive in art and architecture. The emperors, who had once modestly deprecated divine honours, accept the symbols of the gods from their own hands (Plate X.), or are borne to heaven in the chariot of the sun, the sun himself acting as groom holding the horses' heads (Plate XI), until it is no surprise to find them standing like gods, holding a figure of Victory, the old attribute of Zeus, like Honorius (Plate XII., Fig. 1), or seated, a visible deity under the arcuated pediment of a temple, the central figure to which all men's eyes must turn, the supplanter of the old cultus statues of the gods which once looked out upon the worshipper to command his homage as directly as the Christ in Glory over the portal of Chartres (Plate IV.), or the Beau Dieu de Reims in the days before the war. This centralising influence, this emphasis on a principal figure, was essential if the narrative art of the Greeks as we know it upon friezes and pediments without number was to gain new meaning, to be restored to unity of design, to appeal to the worshipper instead of to the artist or spectator; and in this way the imperial figure in art prepares the way for that of Christ. If such a design as

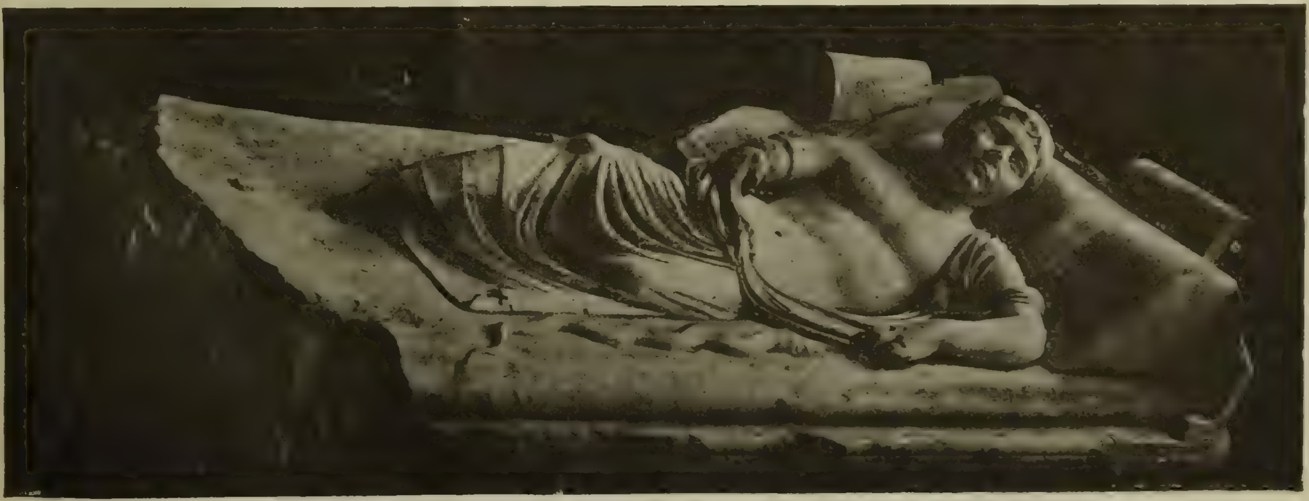
* "Apotheosis and After Life: Three Lectures on Certain Phases of Art and Religion in the Roman Empire." By Mrs. Arthur Strong, LL.D., Litt.D. (Constable & Co. 1915. 8s. 6d. net.)



Tomb of a Dead Boy, perhaps Prince of the Julio-Claudian House, Rome: Museo delle Terme.

The Emperor Valentinian : Silver Disc at Geneva.

is shown (Plate XIII., 2) were set before us without a legend most of us would see in it rather a figure of the risen Lord than a portrait of a Roman emperor of the West, and it is much to have so exquisite a work of art, a work which enlarges our conception of the antique, made for the first time really accessible. This image of Valentinian, "the vivid embodiment of the new centralised authority," set off by the attendant soldiers, whose only part is the service of their lord, suggests a vision of the risen Christ coming to the judgment with His saints behind him, gazing each towards his Lord, yet facing towards the world they come to judge; this is great art, one may say great religious art, and, like the Christian schemes of Raphael and Tintoretto, it depends for its significance upon that marshalling of figures in attendance upon a central figure which Mrs. Strong takes as the supreme contribution of Roman artists to the world.

The second and third lectures deal with the beliefs in an after life as we find them in art from the chariot of Monteleone and the sarcophagus of Haghia Triada down to the monuments of the second and third centuries A.D. The author shows that symbolism dominates these beliefs from the earliest times, that the chariot of the soul, the myths of Dionysiac joys, the need to guard the living from the haunting of the dead, all are but an expression of those beliefs whose influence was to dominate Ionian Greece and Classical Rome to a degree little realised by the ordinary student. Evil influences must be warded from the soul; therefore lions and cocks and other apotropaic objects must be placed upon their tombs. But equally the tomb is essential to the living; the dead must have a home, or his spirit would wander to the torment of the living, without its chance of translation to the higher sphere. Perhaps the noblest form of tomb the world has seen is the recumbent figure of the dead; this is found in Greek lands to an extent not often suspected, though the most familiar ancient examples—and, it may be added, not as a rule among the best—are the Etruscan. The exquisite recumbent figure on Plate XXII. (see page 35), representing some young Julian or Claudian prince, which we reproduce, gives us perhaps the finest Roman example of the kind. The boy lies as if asleep, with only the egg of immortality in the left hand and the crested snake at his side to mark that he has passed into the other world. As a poetical representation of sleep his figure, only found in 1909, has few superiors in art, and if it wants the stark and noble lines of the recumbent dead in mediæval art, it has a wonderful and appealing beauty. By some mistake Mrs. Strong has attributed to this, the eldest of the three great examples of the recumbent child, the poppies of immortality which belong to his youngest brother in the Capitoline Museum, in place of the crested snake which links this Roman monument with one of the oldest Hellenic objects with which she deals, the Chrysapha relief of the heroised ancestors. Underworld beliefs die hard, and their symbolism passes into other religions, sometimes with changed meanings—the form persists if the spirit changes. The book before us indeed furnishes us with another instance of the same process, the Greek myth of Heracles being received into heaven, which appears, charged with new meaning, on the monument of a family of merchants at Igel, near Trèves, whose symbolism Mrs. Strong is at pains to expound. In this new reading of the story the hero, type of the labouring human soul, is caught up in the chariot of Apotheosis, like Cæsar on the altar in the Capitol (Plate VII.), and borne into heaven to the presence of the goddess whom he served. So Greece and Rome meet and fulfil each other, and to deprecate the one because it does not stand where its predecessor stood is to ignore the progress of the human spirit and to be false to the spirit of Greece herself, ever seeking to know and to hear some new thing.

[⁂ The illustrations accompanying this review are taken from the book, and have been lent by the publishers, Messrs. Constable & Co.—Ed.]

PORTLAND CEMENT.

At a meeting of the Institution of Municipal Engineers recently Mr. Horace Boot, M.I.Mech.E., M.Inst.E.E., read a paper on "The Manufacture of Portland Cement," in the course of which he said :—

"Portland cement was probably first manufactured by Joseph Aspden in the eighteenth century; but that was a very different article to what Portland cement which will pass the standard specification is to-day. For it was not until some years later that there was any necessity for a proper uniform mixing of the ingredients, or a mixture that will not vary more than 1 per cent. in the whole year; nor was it considered necessary to grind to such fineness, or burn the slurry so thoroughly as is done to-day. Chemists have made a special study of this, and in all first-class cement the proportion of chalk or limestone to the silica, alumina, and ferric oxide must never vary more than 1 per cent. The constituents of cement, as is no doubt well known by all of you, consist of chalk or sometimes a hard limestone and clay or marl, depending a good deal upon the district from which the raw materials come.

The chief centres of the cement industry are the Thames, Medway, Cambridgeshire, Hull, and generally the North-East of England.

Portland cement was so called on account of its similarity to Portland stone when it is set, but it must not be confused with common lime, which is simply burnt limestone, and possesses no hydraulic properties; nor is it the same as hydraulic lime, which is made out of a slightly burnt mixture of limestone and clay, and has hydraulic properties. Great care has to be taken that the mixture of chalk or limestone with clay or shale is definitely and correctly proportioned. The product is ground very fine and burned at a very high temperature into the form of clinker, the temperature in rotary kilns being as much as 2,500 deg. Fahr. to 3,000 deg. Fahr. This clinker is then ground to powder, and it is usual to specify a fineness of 8 to 10 per cent. residue on a 180 by 180 sieve.

In cement making there are several important factors to be considered, such as the obtaining of the raw materials—that is, chalk or limestone, clay or shale. One, if not both, of the principal ingredients should be adjoining the site of the works, for cement is a cheap commodity and will not permit (if any profit is to be made on the mill) of expensive carriage on the raw materials. Hence the reason why the site of most cement mills is chosen where either or both of the necessary ingredients are present. Again, in the manufacture of cement large quantities of water and coal are required, as well as a suitable means of getting the manufactured product away, by shipment or rail.

It is thus evident that the site of a cement works should be very carefully chosen, that the soil should be carefully tested before finally determining the position. Again, the levels have to be considered to avoid having to haul the clay and chalk uphill, thus adding to the expense of manufacture. Facilities should be present for shipping or railing the cement, and it must be remembered that where large quantities have to be dealt with, such as 3,000 tons of cement per week, a single line of rails would become easily blocked, so that provision should be made for a double line connected to the main line of one of our railway company's systems, or a waterway, if shipment is desired.

If the site is anywhere near a town due regard should be given to the question of nuisance, for it is very difficult to keep the cement works clean, and sometimes the surrounding property might be depreciated for this reason on account of the cement dust.

There are in cement-making what may be called two processes :—

1. The dry process.
2. The wet process.

In the dry process, assuming the raw materials are limestone and clay, they would have to pass through the jaw-crusher machine, and the drying drums, the grinding plant, consisting of ball and tube mills, or combination tube mills, and then be conveyed to the mixing and storage silos, after which it would be burnt in the kilns. From the kilns it goes through the same grinding process as it does in the wet process.

In the wet process the treatment, assuming the raw materials are chalk and clay or marl, consists of passing the raw material through the rolls, from the rolls it drops into the wash mills, from the wash mills, where water is added, it is passed to the wet tube mills for finer grinding; from the wet tube mills it is stored in the slurry mixers and storage tanks. From these tanks it is pumped by the slurry pumps to the kilns. The clinker from the kilns is cooled by passing through a large cooler like a small kiln, and from there is taken by conveyers into the dry grinding mill, where it passes through ball and tube mills, and finally, after it has been ground to extreme fineness, sufficient to comply with the British Standard Specification, the cement is taken to the silos or storage bins, and when cool is ready for use.

When the raw materials are limestone and clay they pass through the jaw crushers, from there to the wet ball and tube mill, or combination wet mill, where water is added; from there to the slurry mixers and storage tanks, and the mixture is pumped by the slurry pumps to the kilns. The dry grinding plant is the same for each method."

The lecturer then dealt with the different types of grinding mills and kilns. As regards the latter, he said :—

"The cement industry has been entirely revolutionised by the use of the rotary kiln, for, after a description of same, it will at once be seen that the labour employed is reduced to a minimum, that a much more uniform and even burning of the cement is possible, with the result that, for ferro-concrete work, rotary-kiln cement is nearly always specified, and will command a higher price than the other kind burned in brick kilns.

The kiln is made up of boiler plates, and consists of a tube, varying in diameter; for an output of 1,000 tons per week it is usually about 9 ft. 6 in. diameter in the burning zone, and often weighs more than 300 tons. It is rotated on rollers, and is driven through gearing at a very slow speed. The fuel is blown in, in the form of powdered coal, and ignited on reaching the burning zone, which attains a temperature of 2,500 deg. Fahr. to 3,000 deg. Fahr. The hot gases travel through the kiln, which is placed at a slight angle above the horizontal, with the cool end at the highest, and on thus to the chimney.

In the cool or chimney end the slurry which is taken from the slurry mixers or storage tanks is pumped in and finally reaches the burning zone, and the clinker produced drops into the cooler, which is like a small kiln, and also revolving. Cold air is drawn in through this cooler to cool the clinker, which clinker takes the shape of round hard pebbles. An immense amount of time, labour, and thought has been spent on the designing of these kilns, for it is no easy engineering matter when one remembers the enormous weight to be revolved, the expansion and contraction that takes place on a length of 200 ft. or more. There are now several firms in this country who can build most excellent kilns, and there is no need to place orders for these kilns abroad. The hard burnt clinker, on leaving the cooler, is then taken to a clinker storage or to bins, and then to the dry grinding mill. With the rotary kiln it is possible to run a cement works, having an output of 2,000 to 3,000 tons per week, with a staff of only thirty men per shift; whereas for the same output with the 'Chamber brick kilns' this number of men would have been necessary for working the kilns only."

The lecturer dealt with the question of fuel and coal-grinding plant, and then went on to say :—

"After leaving the grinding mill the clinker which is now ground is conveyed and elevated into silos for storage. The silo buildings will have several bins with a total capacity of three to four weeks' output of finished cement, which will enable any purchaser, when carrying out an important contract, to have his own bin and draw from it as he desires, so that he can be assured of the uniform quality of the cement. For ferro-concrete work this is important, as you are all aware.

The why and wherefore of the greater use of reinforced concrete construction is not difficult to find. Those engineers who have had the designing of large structures to carry heavy machinery, such as is met with in industrial mills or for the building of large storage kilos or bins, will fully appreciate these remarks, because with a reinforced-concrete construction it is a simple matter to demonstrate in figures the strength of such buildings and allow a proper margin or factor of safety; whereas with brickwork such a calculation is very difficult and certainly unreliable, for nobody can accurately say what is the adhesion of brickwork and what factor of safety has been allowed.

Recently my firm has had to design some large silos, capable of holding 10,000 tons of cement, and it is surprising with brickwork how uncertain one is when finished as to the final strength. But if such silos are built with einforced concrete one can be certain of the actor of safety.

There are several methods of building the silos, but the best one, I think, is to design it of ferro-concrete. The emptying of cement silos is not such a simple problem as it appears for cement arches when packed closely. An ingenious method to use is the vacuum process, in which a cement bag is put into a small chamber and the bag fixed on to a pipe connecting it with the silo. A vacuum is then produced in this chamber, causing the cement immediately to rush from the silo through the pipe into the bag and fill it. As soon as the bag (which is automatically weighed) is filled to the correct weight, the vacuum is cut off and the door of the chamber opens to allow the man to remove the sack. The cement in the bag is then ready for rail or shipment. A large loading platform with ample floor space is required, with railway lines running alongside it, so that the bags of cement can be loaded into trucks."

THE FUTURE OF OUR ENGINEERING INDUSTRIES.

IN the shadow of war and the stress of endeavouring to cope with the ever-growing demands—always more and more surprising in their ramifications—of the great colossus it is perhaps natural that reflections as to the industrial position of our nation at the termination of hostilities should not flow easily, for it is indeed a noisy and boisterous atmosphere in which to attempt mature deliberations. None the less it is true that if these reflections are delayed until peace comes into her own it will be too late to take advantage of many of the lessons which the war has taught, and of the changed situation which must be contemplated. When we hear of business men in Germany meeting nearly a year ago to discuss the problems and prepare for the modifications which this upheaval has produced we may well reflect upon the necessity for organisation, and feel that, whatever the outcome of the struggle, power of co-ordinating the interrelations of industry, which has meant so much to Germany, will be in no wise a dead thing in that country, and if broken will recover.

Had Britain possessed the appreciation for scientific arrangement and scientific principles enjoyed by our enemies, it is hardly too much to say that the war would have been over by now, and there is little doubt that the splendid individual characteristics possessed by our nation are very largely thrown away through the misdirection or lack of proper direction of its efforts. And it is probable that no one who has worked for any public service, whether in an official or private capacity, during the present crisis will feel inclined to dispute this view. The men are there, the means and the energy and capacity are there, but that great essential, the scheme which shall ensure that everyone is in his right place and working with and for his fellows on a preconceived and studied plan, is wanting. It may be said that the circumstances of this crisis are so exceptional that it was not to be expected that any pre-existing plans could meet the emergency.

Suppose, for example, that the whole of the engineering industries had before the war been co-ordinate for industrial purposes, by which is not meant linked up as a ring fence for the purposes of maintaining wage standards or profits, but so systematized that the parts common to all or to each group of such industries had been working together on a plan for general advancement. Had these great branches of our national prosperity possessed a "head" which was directing the hundred "arms" and the arms the "fingers" representing the specialised trades, how many mistakes, delays, overlappings, and financial wastages would have been prevented in summoning the united efforts of the hundred workers who are called upon in modern warfare to be the orderlies of a single private in the firing trench! Suppose that these industries, by what would have been a trivial individual contribution, had for their common benefit arranged, for example, in previous years to conduct a series of researches into the microstructure of metals, a subject (like many others which do not show a weekly return of profit) left almost entirely to the private efforts of a few professional individuals, what might have been the result at the present time? Had an alloy suitable for heavy ordnance even slightly superior to that in ordinary use been discovered, the effect upon the tide of war might well have been far-reaching enough not only to repay the outlay a thousandfold, but to earn for ever the gratitude of the nation.

What is wanted is an Intelligence Department, with a permanent committee sitting, not to hamper every trading firm with cast-iron regulations, but to act as a centre for the consideration of all matters affecting generally engineering interests. This department, which would be controlled by a committee representing the foremost experts in the trades, would be responsible for a great clearing house of information dealing with trade development, and a research factory devoted solely to experiments, not merely as conducted in the laboratory of the scientist, but with the addition of trials on a commercial scale. The Intelligence Department would develop the kind of work recently initiated by the Board of Trade for industries generally, and its duties would consist not only of digesting trade statistics and consular reports for the benefit of special branches of engineering, but of preparing pamphlets showing the progress of the applications of research in other countries. It would also act as a centre for the exchange of information on all relevant matters between the industries concerned.

The Research Department would conduct experiments in pure science with a view to advancing knowledge of the properties of the various materials used, and would probably concentrate its attention initially on ascertaining the relation of physical properties to chemical composition in the new fields of alloys of iron. In close touch with the scientists conducting these researches would be others less highly trained in laboratory research, but with a thorough appreciation of manufacturing conditions and requirements, who would conduct experiments in the research factory and lead to commercial value of the work in the laboratory.

The objection may be raised that each firm has its own methods and secrets, and if it makes discoveries prefers to benefit by them individually; but if this war has taught anything, it is surely that the power of efficient action united is the only thing which can bring safety and prosperity, and what is gained by the watertight compartment system is far more than lost by the lack of what may be called side-issue knowledge, for it is well established that the more any branch of industry advances the greater is the necessity for keeping in touch with other branches, which to the casual observer may appear to have but little connection with it.

If such a scheme as has been outlined possesses any merits, now is the occasion, not perhaps to introduce it into being, but to prepare for its introduction, and this for two reasons. Firstly, there has never been a time when the engineering industries have been brought into such close contact. Munition Committees control every machine tool in the country, statistics are available which have never previously existed, and there is a spirit of appreciation for science and organisation—albeit, born of necessity, not of education—which has never been known before in this country. Secondly, science has received an official recognition, for which it has been waiting since the days of the Prince Consort, in the formation of a Government Committee for Industrial Research. This is a strong Committee, composed of eminent statesmen, assisted by scientific and practical experts of recognised standing. Its labours are about to begin, and it is for industry to see that this great opportunity is not frittered down to the confines of mere academic work, as has been too often the result of lesser schemes. It is not suggested that it is the function of the Committee on Industrial Research to initiate such a scheme for the engineering interests, but were it put forward by the industries there is little doubt that most valuable co-operation might be obtained from this Committee, whose sympathies would be obviously inclined to any movement which would help to marshal the forces of mechanism.

List of Competitions, Contracts, etc.

For some contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, —; Contracts, iv., vi.; Public Appointments, lii; Auction Sales, lviii. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

⁂ It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Contracts.

BUILDING AND PAINTING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

January 10. — **Newry.** — Cottage.—For the erection of a gatekeeper's cottage at Greenfields Crossing, between Newry and Goragh Wood, for the Directors of the Great Northern Railway Company. Drawings, etc., may be inspected at the Engineer's offices at Dublin and Belfast.

January 12.—**Rathdown.**—Slating, etc.—For keeping in order, for one, two, or three years, as may be decided, the slating, gutters, down-pipes, and chimneys, of all the Workhouse buildings, including out-offices, for the B.G. Specification by Mr. P. H. McCarthy, B.E. Forms of tender of Mr. Patrick Cunniam, Clerk of the Union, Clerk's Office, Loughlinstown.

January 13.—**Manchester.**—Glazing.—For the glazing of a roof in the Smithfield Market for the Markets Committee. Specifications, etc., of Mr. R. Lawton, Works Manager, Coop-street Workshop, Smithfield Market, Manchester.

January 19.—**Romsey.**—Demolition of Buildings and Erection of Cottages.—Pulling down of some existing buildings in Romsey and for the erection of three cottages on the site for the Corporation. Plans and specification of the Borough Surveyor, Market-place, Romsey.

January 24.—**Irlam.**—Artisans' Dwellings.—The U.D.C. invite tenders for the building of seventy-eight houses on three sites, as follows:—Thirty houses on site No. 1, twenty-eight on site No. 2, and eighteen on site No. 3. The conditions of contract, etc., may be inspected and copies of the bills of quantities, etc., obtained on application to Mr. Roland H. Winterbottom, Surveyor, Council Offices, Irlam, on payment of £5.

February 7.—**Lancashire and Yorkshire Railway.** — Painting. — The Directors invite tenders for painting at various places. Forms of tender, etc., may be obtained on personal application at the Engineer's Office, Hunt's Bank, Manchester.

February 9.— **Lancashire.** — Painting.— For painting at various places for the Directors of the Lancashire and Yorkshire Railway. Forms of tender, etc., on personal application at the Engineer's Office, Hunt's Bank, Manchester.

No Date.— **Kenmare.** — Rectory.—For the erection of a rectory, for the Rev. R. P. Rowan, Kenmare. Mr. G. A. E. Hickson, architect, 23, Denny-street, Tralee. Deposit, £1 1s.

No Date. — **Rosyth.** — Houses.—Contractors prepared to tender for a minimum of twenty-five houses (all trades) are invited to send their names to the Scottish National Housing Company, Ltd., 111, George-street, Edinburgh.

FURNITURE, MATERIALS, etc.

. January 8.—**Bourne.**—Granite, etc.—Supply to the R.D.C. of about 6,000 tons of granite and 2,000 tons of slag. Tender forms of Mr. Thomas Lake, District Surveyor, Bourne.

January 12.—**Dublin.**—Builders' Materials.—Supply to the Dublin Port and Docks Board of builders' materials for twelve months, ending on January 31, 1917. Mr. N. Proud, Secretary, Port and Docks Office, Westmoreland-street, Dublin.

January 14.—**Irlam.**—Broken Granite, etc.—Supply to the U.D.C. of the following materials required during the year ending March 31, 1917:—Broken granite, tarred slag, kerbs, setts and paviors' chippings, granite concrete flags, cement, stoneware pipes, iron castings. Forms of tender of Mr. R. H. Winterbottom, Surveyor, Council Offices, Irlam.

* January 20.—**Lambeth.**—Materials and Services.—The Lambeth B.C. invite tenders for the supply of materials and for rendering certain services during 1916.

March 8.—**Aberaman.**—Paints, etc.—Supply to the directors of the Powell Duffryn Steam Coal Company, Ltd., from April 1, 1916, of paints, etc. Forms of tender, etc., of the Stores Manager, Aberaman Offices, near Aberdare.

ENGINEERING, IRON, AND STEEL.

January 10.—**Motherwell.**—Footbridge.—Providing and erection of a footbridge over the railway at Motherwell, for the Directors of the Caledonian Railway Company. Drawings, specification, and schedule at the office of the Company's Engineer, Buchanan-street Station, Glasgow. Deposit, £2 2s.

* January 10.—**St. Pancras.**—Extension of Power House.—The St. Pancras B.C. invite tenders for extension of power house.

January 11. — **Reigate.** — Boiler. — For the supply and installation of a new sectional boiler at the Baths, Castlefield-road, Reigate, for the T.C. Specification, etc., and full particulars may be obtained of Mr. Fred T. Clayton, Borough Surveyor, Municipal-buildings, Reigate.

January 13.—**Avonmouth.**—Drain Diversion, North Side, Royal Edward Dock.—Bristol Docks Committee invite tenders for the excavation of a deep trench and the laying of a 12-in. stoneware pipe drain at the Royal Edward Dock, Avonmouth, etc. Copies of the specification can be obtained from Mr. Thomas A. Peace, Engineer, Engineer's Office, Cumberland-road, Bristol, on production of a receipt for deposit of £1 paid to the Secretary of the Docks Committee, 19, Queen-square, Bristol.

No Date.—**Bath.**—Boiler.—For the supply and fixing of a new boiler for the heating apparatus at Kingsmead Council School, for the Education Authority. Specifications, etc., of the Surveyor of Corporate Property, Guildhall, Bath.

ROAD, SANITARY, AND WATER WORKS.

January 8. — **Castlebar.** — Water-main.—For supplying and laying about 550 lineal yds. of 2-in. cast-iron water-main. Specification prepared by Mr. E. K. Dixon, C.E.

January 12.—**Dublin.**—Paving Setts.—Supply to the Dublin Port and Docks Board, for the term of twelve months, ending January 1, 1917, of paving setts. Forms of proposal may be had between the hours of eleven and one o'clock, of Mr. N. Proud, secretary, Port and Docks Office, Westmoreland-street, Dublin.

January 13.—**Bristol.**—Trench and Pipe Drain.—For the excavation of a deep trench and the laying of a 12-in. stoneware pipe drain at the Royal Edward Dock, Avonmouth, for the Docks Committee. Specification, etc., of Mr. Thomas A. Peace, Engineer, Engineer's Office, Cumberland-road, Bristol. Deposit of £1 to the Secretary of the Docks Committee, 19, Queen-square, Bristol.

January 22.—**Norwich.**—Stone, etc.—Supply to the Eastern and Western Highways Committees of the Norfolk C.C. of flints, gravel, chalk, etc., for the year ending March 31, 1917. Specifications, etc., of Mr. W. W. Gladwell, County Surveyor, The Shirehouse, Norwich.

January 24.—**West Suffolk.**—Surface Tarring and Supply of Tar.—(1) Surface tarring of various main roads in the county during 1916; (2) supply of refined tar or other proprietary article, for the surface treatment of roads. Conditions of contract, etc., may be obtained on application to Mr. W. Lionel Jenkins, A.M.Inst.C.E., County Surveyor's Office, Shire Hall, Bury St. Edmunds.

January 29. — **Worcester.** — Granite, etc. — Supply to the Worcestershire C.C. of granite, blast furnace slag, and tar macadam during the year ending March 31, 1917. Forms of tender, etc., of Mr. C. F. Gettings, County Surveyor, 30, Foregate-street, Worcester.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to THE BUILDER LTD., and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

◆

CAMDEN TOWN AND WEST NORWOOD FIRE-STATIONS.

It has been agreed, on the recommendation of the Brigade Committee of the L.C.C., that tenders be invited from selected firms for the execution of the necessary painting work in connection with (1) the alterations in progress at the Camden Town fire-station, and (2) the erection of a new fire-station at West Norwood.

THE BUILDING TRADE, BRADFORD.

During the past year the building trade in Bradford has been seriously affected by the war. Just in one direction has the war been beneficial. It has led to the erection of a number of new workshops and to many extensions of premises where engineering work is carried on. Similarly there has been a considerable amount of work done in extending the premises of textile manufacturers to enable them to cope with the great rush of the past year for khaki and other cloths. While only one mill has been built, there have been twenty-eight workshops, fifteen warehouses, five weaving sheds, a combing shed, and two spinning sheds erected. It was in the backbone of the building trade—houses and shops—where the weakness manifested itself. A number of contracts of a public character would have been carried out this year had not the Local Government Board put their foot down and declared that the work must be postponed.

[Those with an asterisk (*) are advertised in this issue.]

PRICES CURRENT OF MATERIALS.

[Owing to the exceptional circumstances which prevail at the present time, prices of materials should be confirmed by inquiry.]

Since our last issue Portland cement, metals, slates, lead, glass, and oil prices have been increased.—ED.

*** Our aim in this list is to give, as far as possible, the *average* prices of materials, not necessarily the highest or lowest. Quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.

NEW COMPANIES.

THE undermentioned particulars of new companies recently registered are taken from the Daily Register compiled by Messrs. Jordan & Sons, Ltd., Company Registration Agents, Chancery-lane, W.C.

DAVIES BROTHERS (WALTHAMSTOW), LTD. (142,460), Blackhorse-lane, Walthamstow. Registered December 20. To carry on business of steam joiners, timber merchants, builders, estate developers, and sawmills, now carried on by Davies Brothers at above address. Nominal capital, £15,000 in 15,000 £1 shares.

JOHN LEVICK, LTD. (142,597), 149, Alma-street, Aston, Birmingham. Registered December 22. To acquire and take over business of metallic and railway fittings, electrical, mechanical, and general engineers, brass and iron founders, and metals of all kinds, now carried on by J. Levick at above address, builders, contractors, etc. Nominal capital, £50,000 in 50,000 £1 shares.

A. & B. HANSON, LTD. (142,512). Registered December 23. To carry on business of builders, contractors, decorators, surveyors, land and house and estate agents, sanitary, gas and electrical engineers, coach builders, saddlers, etc. Nominal capital, £5,000 in 5,000 £1 shares.

H. COLEMAN & CO., LTD. (142,517). Registered December 23. To acquire, take over, and carry on business of furnishing and general ironmongers, builders, merchants, water and sanitary engineers, now carried on by W. Coleman at High-street, Harlow, and to carry on business of iron, brass, and other metal workers, dealers in earthenware, etc. Nominal capital, £1,200 in 1,200 £1 shares.

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

VOL. CX.—No. 3806. JANUARY 14, 1916.

GOTHIC ARCHITECTURE.

AN age which is introspective and critical is seldom one which is marked by great successful creative effort in art, and the century which is past has been a barren one, especially in the domain of architecture, and the sterility of production has been marked in every country of Europe.

We have invented reasons to demonstrate why art in the past lived, and proved to our own satisfaction that the artist was formerly concerned with art alone and almost devoid of the mundane desires and aspirations of the commonplace present. We confuse art with morals, assuming them to be equivalent expressions of one idea; and in other phases of thought we deny that there is any connection between the two. Like the ancient Athenian, our desire has been to hear some new thing; like him we are frequently deceived into accepting old ideas as revelations of the truth, simply because they were expressed in somewhat original form.

Tolstoi, at one end of the scale, represents intellectual and, we may say, fatalistic pessimism: "The science of æsthetics, the science of the beautiful, neither did nor could vanish because it never existed. The Greeks, just like everybody else, considered art good only when it served goodness, and bad when it was in opposition to that goodness. And the Greeks themselves were so little developed morally that goodness and beauty seemed to them to coincide." And again: "To his class belongs the astonishing theory of Baumgartenian Trinity —Goodness, Beauty, and Truth—according to which it appears that the very best that can be done by the art of nations after 1900 years of Christian teaching is to choose as their ideal of life the ideal that was held by a small semi-savage slave-holding people who lived 2000 years ago, who imitated the nude human figure extremely well, and erected buildings pleasant to look at." Tolstoi, like the mystic and socialist he was, finally concludes his summary by saying that "Art is neither a pleasure, a solace, nor an amusement; art is a great matter. Art is an organ of human life transmitting man's reasonable perception into feeling." And the task of Christian art "is to establish brotherly union among men."

According to Mr. Clive Bell,* the essential quality in works of art is that they must possess "significant form," which is that which produces emotion, and in order to appreciate art we only need possess a sense of form and colour and a knowledge of their dimensional space; while he further states, "The forms of art are inexhaustible, but all lead by the same road of æsthetic emotion to the same world of æsthetic ecstasy." As against Mr. Clive Bell we have Mr. March Phillipps, who tells us that art is the expression of life, and in his *rôle* of a latter-day Ruskin again denounces the soullessness and folly of the Renaissance. But none of these writers prove their points; they start with theories, and facts are made to conform to them; but we doubt if any artist would find help or guidance from the criticisms made, though many of them are extremely ingenious. Of quite another character is Mr. Geoffrey Scott's recent work on the Renaissance,† as he builds up his theories from facts instead of inverting the process. More than this, he demonstrates, what is obviously true, that the Renaissance architects were not metaphysicians and moralists, but artists who were not deterred by logical scruples from producing harmonies of line and form, because they could not be made to conform absolutely to the practical requirements of structure. Mr. Scott, whose predilections are clearly in favour of the Renaissance, is more concerned in explaining and proving his point of view than in attacking that of others, which gives his book a practical value not possessed by other recent treatises.

As a broad rule, there are fewer reasons than are generally supposed for assuming that there is any great difference between the "truthfulness" of Gothic architecture and that which followed it—"unmeaning" and unstructural pilasters in Renaissance architecture have their counterpart in "unmeaning" areas of arcading spread over the walls of many mediæval churches. In no period of architectural history have builders, whether mediæval or Renaissance, hesitated to raise parapets and screen walls for architectural effect which have little relation to the roofing behind. The great mediæval church is the rendering of the constructive solution of a problem which gives scope for a perfection of architectural expression, but the same requirements of vault, thrust, and buttress can be carried out in other mediums, while the simpler requirements of domestic architecture—the warehouse and the business building—call for less ingenious and complicated methods of construction, whatever style they have been designed in. We are most of us secretly a little disappointed that the elaborate and ingenious construction of earlier times can be so readily dispensed with by the use of methods of building now known to us—a disappointment which finds exemplification in the reluctance of many to use steel, and in the expressed opinion that it can only be logically used in post and lintel construction. We are unable to see why, if we delight in arch, dome, and vault, and find that steel and concrete enable us to construct them with readiness, we should dispense with their aid because we can cover space more "logically" horizontally. To do so is to set a premium on what is difficult and to become unpracticable theorists, giving more value to ingenuity than to art. We believe that in every age mankind has constructed what he was obliged to construct economically to meet utilitarian wants in the simplest and most direct method known to him, and that, given greater opportunities, he has searched, not for the "most logical expression of structure," but the utmost he was capable of creating to delight his perceptions of beauty.

If the possibilities of ferro-concrete construction had been known in mediæval times, before the Gothic era, and if the materials had been forthcoming, it is certain that the course of architectural development would have been a different one; but if they had been discovered when Gothic development was at its height it is more than probable that the builders of Beauvais would have utilised them, not to institute a fresh departure in design, but as a means which would have enabled them to fulfil their aspirations to obtain more height and dimensions with safety. In a similar way the problems which Wren had to deal with in the dome of St. Paul's would have been simplified, and we have little doubt that neither the Gothic builders nor Wren would have troubled themselves about the truthful or logical use of the new material in the sense that modern critics use these terms. Gothic proportions in windows, vaults, and buttresses were obviously profoundly affected by the possibilities and limitation of stone; but, an ideal or manner of design being once formed and taken as a standard, new methods of obtaining the æsthetic results sought, which saved material and ensured safety, would have been adopted without discussion of abstract niceties. The Norman builders frequently built their huge piers of rough rubble, merely casing them with well-constructed stonework, and it was not until the desire for lighter proportions brought with it the necessity for sounder construction that they were generally adopted.

We think that the architectural requirements of one age give scope for greater architectural expression than those of another, and that mediæval architecture was the gainer, because the Church required great buildings possessing certain qualities; while the requirements of later ages gave less scope for the supreme expression of æsthetic skill, and therefore, given the equal necessity of any other type of building possessing inherent architectonic possibilities, great architecture would be likely to be produced in any age. For at least four centuries Western Europe devoted its energy so fully to the production of one type of building that all others may be held to be comparatively negligible, which more than any other reason accounts for the greatness of the mediæval ages in art.

---

* "Art." By Clive Bell. † "The Architecture of Humanism."

The books which are of most value to the student of art are those which are devoted to description rather than to theory, which render Sir Thomas Graham Jackson's work on "Gothic Architecture" especially valuable.* The author states that he has never visited Spain, and considers that he can add nothing of value to what Street and others have written, while the war has prevented his visiting Germany and the Netherlands to revise notes taken years ago. Thus the scope of the work is limited to France and England, in which countries Gothic is at its best, and to Italian Gothic, which may be described as its weakest phase. The last section of the work deals with the various phases of Gothic art in Sicily. Most of the drawings with which the book is especially illustrated have been made by Sir Thomas Jackson at different times during half a century, and, together with the writing, show his intimate knowledge and study of the subject. We like his definition of the three principles which he states have governed the development of Gothic architecture as of every good style the world has seen. They are: "Solidity"—that is, the construction must be sound and good; "economy," used in the original sense of the word—"that is to say, a nice regard for arrangement and proportion, the due observance of circumstance of time and place, of means available, of the materials at your disposal, and of the mode of using them to the best advantage."

"The third principle is that the design should be the æsthetic expression of the construction. For architecture differs from mere building simply in this, that it is the art of building expressively and therefore beautifully. The first two principles are within the compass of everyone, but the third can only be applied in an artistic age and by an artistic people."

These are admirable definitions so long as the third principle is not ridden to death, for, as we have previously said, no style can be defined as being entirely logical, and it is doubtful whether any of the builders of the past have consciously set out to make it so. Constructive knowledge and its limitations have governed the beginnings of style in architecture; but, once a manner and tradition has been formed, we believe the master builders would have availed themselves of any new methods available to carry out their æsthetic conceptions. In other words, in the beginning construction governed style; in later periods of development great builders carried out their conceptions more independently of structural limitations.

The sections of the book dealing with vaulting are admirably explained and illustrated, and form a fitting prelude to a luminous account of the French cathedrals, which gives a vivid and terse picture of one of the greatest and most wonderful periods of architectural development the world has seen, culminating in the cathedrals of Reims, Amiens, and Beauvais. The Provincial French styles of Normandy, Burgundy, Toulouse, and Anjou, the distinctive features of which are well described and illustrated, bring the story of the development of French Gothic architecture to a close. As the writer says, "With Beauvais the history of the development of Gothic architecture in France is complete. We have traced its progress from a simple and tentative beginning at S. Denis and Senlis to Noyon and Sens, where Romanesque tradition was almost lost, and to Paris and Chartres, where it is quite neglected. At Reims the whole system of Gothic architecture is understood and carried out in its entirety, but without weakness. At Amiens the whole theory of construction was displayed and pursued to its logical results with full assurance and a little temerity. At Beauvais it was pushed further still, and if Amiens reached the margin of safety, Beauvais rashly overstepped it." A comparatively short chapter deals with the later geometrical Gothic of France, taking the reader to the fifteenth century.

The remainder of the first volume is occupied with a similar review of the earlier periods of English Gothic, in which the writer says we do not find "that triumphant display of constructive science which we see at Amiens. For one thing, our churches, though covering as much or more ground, are never so high as those French churches where this construction is most thoroughly developed, and there was not the same need for economy."

Sir Thomas Jackson dissents, with most architectural authorities, from Professor Moore's* dictum that true Gothic, being the logical development of a system of equilibrium attained by thrust and counter-thrust, is only to be found in France. As he rightly says, "It limits a style to only one of its manifestations, and vaulting, though important, does not cover the whole ground." An admirable description and analysis of Westminster fittingly closes the first volume.

In the second volume the development of the traceried window to the end of the geometrical Decorated Period precedes general chapters on that epoch, and the Flowing Decorated Period and the development of the English spire are followed by chapters dealing with the Perpendicular and Flamboyant Styles of England and France. Of the Perpendicular style the author writes:—"It has been the fashion to decry it as debased Gothic: as Gothic in its decrepitude; the work of mere mechanical designers, unworthy successors of the artists to whom we owe the noble work of the twelfth, thirteenth, and fourteenth centuries. That in some respects it declines from the standard of Amiens and Westminster may be admitted. But to condemn as a decadent art the style which has given us the glorious towers of Gloucester, Canterbury, Boston, Malvern, and Magdalen College at Oxford, those which cluster round the Mendips or stud the vales of Somerset, the splendid churches of the Fen country, the chapels of Windsor, of Henry VII. at Westminster, and of King's College at Cambridge, than which we might say architecture can add no more, is surely to trifle with the subject and mere pedantry." The story of English Gothic is, we think, rightly held to include Kirby House and other of the earlier pseudo-Renaissance work, but the writer takes a somewhat exaggerated view when he says that the "towers and steeples of Wren and his successors are more Gothic than Classic, and are as alien to Vitruvian rule as Westminster Abbey itself."

The Flamboyant architecture of France is well analysed and compared with English Perpendicular developments, "which never lost that air of severity and constraint with which it began at Gloucester." Sir Thomas Jackson writes:—"The sentiment of Flamboyant architecture in France is very different. Here is gaiety and luxury; dignity is forgotten; all must be joyous, fanciful, and clever."

The section on Italian Gothic, which completes the work, forms the most interesting part of an exceedingly able and scholarly book. "The Italian had none of the superstitious faith in the sanctity of ecclesiastical architecture which surrounded the northern cathedral with holy legend, mystic vision, and saintly miracle. The church itself had for him less mystery and inspired less awe. He was behind the scenes, and saw the working of the machinery and the manufacture of the thunder." In this sentence and another which occurs later—"The ideal of the Italian was colour, that of the Frenchman light and shade"—the author expresses what we feel to be the shortcomings of a style which is alternately over-praised by enthusiasts and somewhat unfairly criticised, for the northern peoples imported into their buildings the mysticism and sense of awe which for us will always be the abiding attraction of mediæval architecture; and it is possible, for this reason, that the palaces of Venice rather than the Italian churches will to us be the most appreciated examples of Italian Gothic. The interesting phases of Sicilian Gothic bring us to the author's conclusion, which ends with an eloquent appeal to architects to regard bygone art as their tutor rather than their model, to bind themselves resolutely to the problems of the day, and to new modes of construction, "to satisfy these demands in the most direct and common-sense way regardless of precedent and authority, and they will be working in the true Gothic spirit."

NOTES.

St. Paul's Cathedral.

It is stated that additional funds are urgently needed to provide for the safety of St. Paul's by strengthening the piers and buttresses. Two years ago an appeal was made for £70,000 for the Cathedral Preservation Fund, but only half the amount was provided when the war broke out. According to a daily paper, "Canon Alexander, Treasurer of St. Paul's, in the course of a statement on the structural condition of the building, said that the vast and imperfectly distributed weight of the dome has caused the present problem. The pier on which work has been going forward for a long time—standing at the critical point of pressure towards the south-west—has been reported in the last few weeks to be showing even graver conditions than had been anticipated. The danger is not so much one of recent settlement as of 'senile decay,' accelerated by the gradual pressure of the dome, the rusting of iron, and internal degeneracy of the extremely inadequate repairs executed at some earlier period. It was said recently that 'only the loyalty of the materials to one another' has kept the fabric safe so far. Some of the most delicate work, thus taken in hand just in time, has already been carried out, but it is not known what difficulties may arise elsewhere." It is unfortunately true that great buildings always entail the expenditure of large sums of money in repairs when they have been in existence for a few hundred years, a result which is largely the effect of the truth expressed in the Eastern axiom, "The arch never sleeps," and St. Paul's is apparently no exception to the general rule. The necessary funds will, we hope, be provided without undue delay.

The Organisation of Scientific Research.

The Board of Education has issued a very important leaflet, which states that there is a strong consensus of opinion that a special need exists for new machinery and further State assistance in order to promote and organise scientific research, chiefly with a view to its application to trade and industry, and it is therefore proposed to establish a permanent organisation for the promotion of industrial and scientific research. The scheme provides for the establishment of a Committee of the Privy Council responsible for the expenditure of any new moneys voted by Parliament for scientific and industrial research, and a small Advisory Council responsible to the Committee of Council, and composed mainly of eminent scientific men and men actually engaged in industries dependent on scientific research. The primary functions of the Advisory Council will be to advise the Committee of Council, first, on proposals for instituting specific researches; second, *proposals for establishing or developing special institutions or departments of existing institutions for the scientific study of problems affecting particular industries and trades;* third, the establishment and award of Research Studentships and Fellowships. Under the clause we have italicised the Royal Institute of British Architects might apply for a grant for the thorough scientific investigation of dry rot, such investigation to be carried out in connection with a specified college of science, and a great boon would be conferred on the building industry. All particulars of procedure can be obtained through the Board of Education, which, we understand, is more than ever convinced of the necessity for the new departure.

The Housing Problem.

At the Scottish National Conference, promoted by the Labour Party Housing Committee, one of the speakers stated that private enterprise had absolutely failed to meet the necessities of the case—which is both untrue and unfair, considering that until the last few decades the whole of the housing in the country was provided by private enterprise. The late Government has interfered with the natural laws of supply and demand by imposing what amount to stiff penalties on private enterprise, and it is this interference which is responsible for most of the present shortage. Labour leaders are not concerned with questions of national finance, and the labour sections of the community only contribute indirectly to national taxation. In these circumstances they are inclined to advocate national expenditure, failing to see that their employment depends in no small measure on the ability of individuals to employ their capital remuneratively, which is intimately connected with the state of the national finances. We are, in a measure, glad that the present congestion has occurred, as it may serve to bring home to the community the truth that it is in the national interests that the claims of all classes should receive full and adequate consideration. Another speaker observed that what was necessary was that public authorities should set a standard and see that the speculative builder and others observed that standard. This is true enough, and quite within the powers of the authorities, but it is also necessary that the rewards of enterprise shall not be taken away from the speculator, or the last state of working-class housing may be worse than those which obtained formerly.

Huddersfield Housing.

A special meeting of the Huddersfield Town Council has been appointed to consider and report on the means to be taken to make good the undertaking given to the Government to provide accommodation for the increased population which would be brought to the neighbourhood if Huddersfield were made the seat of the British Dyes Industry. The Government is being asked to give special grants on the ground that the dye industry is an urgent national undertaking, while the building societies may co-operate by lending money in accordance with a suggestion made by the Mayor. In the meantime thousands of labourers engaged in the construction of the new works have had to be provided with temporary huts by the company, the lodging-houses are full, and rewards are being offered for information as to empty houses. The housing shortage, acute in most parts of the country, has apparently reached its most acute point in Huddersfield.

Piazza del Popolo, with S. Peter's on the horizon (at the side appears Bernini's Church of S. Maria dei Miracoli). (*See page* 44.)

BERNINI AND THE BAROCCO:

III.—BERNINI AS A MAN.*

By Selwyn Brinton, M.A.

In the two earlier notices on this subject which have appeared in the pages of the *Builder* † I have treated Bernini's achievement both in sculpture and in architecture; it only remains to me now to complete my survey, within the limits allowed me here, by what I have described under this heading with the title of "Bernini as a Man."

I venture to believe that this may be found not the least interesting part of that survey.

Modern research has done a great deal to revise the position of the gifted artist in relation to what we may call his "*milieu*"—the surroundings, the influence of the spirit of the age in which he lived, and upon which his creative genius expended its treasures.

Gian Lorenzo Bernini was born, as we have noted, in December of 1598; his long and brilliant career ended on November 28, 1680. We are therefore with him far away already from the great creative effort of the Renaissance. "The dawn of his life," says Fraschetti, "was already the sunset of art. He could only inherit from the last survivors of that past the exaggeration of form, the contrast of light and shade, the academic conventionalities of conception and canons of art. . . . His genius has all the enchantment of life among things that are dead—the sweetness of a beautiful living form among the ashes of a deserted dwelling-place."

But not all was dead even within that age. It was an age which saw the Church, recovering herself after the Counter-Reformation, reappear as a vital force in Europe, under the intimate and overpowering influence of the Company of Jesus: it saw Rome, among the general decay of Italian life and politics, assert herself once more as the City of Art and the Centre of Catholicism.

Gian Lorenzo Bernini, established for his early life at Rome under the direct patronage of the Papacy, and of more than one among the College of Cardinals, was exposed to the full current of this movement in Catholic life and thought.

He could not have opposed it; and if he had done so he would have condemned his art to atrophy and extinction. He was exposed to a force which was stronger than himself; and this is perhaps what Adolfo Venturi means when he calls him a puppet of destiny.

But he never had sought to oppose this influence. He absorbed its good and its evil into his art and his personal life; and it is the outworking of this influence in his creative art which I propose to trace in this necessarily brief summary.

That the antique had come to him in youth as a tremendous and overpowering revelation we have traced both in the records of Baldinucci and in the evidence of his own earlier sculpture; that the study of Nature had been no less attractive we saw in the realism of such early creations as the bust of Monsignore Montoya, or the S. Lorenzo, or his later Cardinal Scipione Borghese.

With his S. Lorenzo we have even the story, from his son Domenico, that the artist had thrust his own leg into the flame to note the effect of the shrinking of flesh from fire; and here we have just the material which in the earlier Renaissance would have produced such a realist as Pollaguolo, such an idealist in form as Buonarroti.

But in the moment of his development, when in the exquisite Daphne he had proclaimed to the world the message of a new vision of beauty, he is caught up in the advancement of his Papal patron, and bound fast to the chariot wheels of a triumphant and expansive Papacy. His art is diverted to architecture, wasted—we may almost say—in painting, trammelled with the etiquette, the intimate duties of a Papal Court; and when again he turned to sculpture in later life it was under those new influences with which the Jesuit movement had slowly enveloped him.

The realist of the wonderful bust of Montoya, of the Scipione Borghese, of the lovely and wilful Costanza Buonarelli, the noble classicism of his Apollo and Daphne, and the exquisite reserve of his monument to Carlo Barberini is changed in this later art into the effort to impose upon the marble the sentiment which underlies human endeavour—the sense of monarchic power inspired by a Louis XIV., the outpouring of religious ecstasy of a Saint Theresa.

It is to be noted here that Bernini's whole busy life in Rome had been in close contact with that Jesuit Order which had there its natural centre.

One of his early commissions (A.D. 1622) had been that of the half-figure of Cardinal Bellarmino, procured for him through the influence of Cardinal Farnese, for the Church of the Gesú at Rome—a monument which is still in its place on the left of the high altar. The whole church is indeed a wonderful externalisation of the ideas which lay behind this Jesuit movement of the seventeenth century. "The Jesuit," says Taine, "weakened the redoubtable doctrine of Grace, smoothed over the rigid prescriptions of the Councils and the Fathers, invented the more indulgent direction of the conscience, an easier moral law, a more accommodating casuistry, a facile system of devotion; and by the cleverest manipulation of distinctions, restrictions, interpretations, probabilities, and all the brushwood of theology, succeeded with his supple hands in restoring to mankind the liberty of pleasure. . . . Within these hands"—says this writer—"so ingenious and so delicate Religion has become fashionable. She seeks to please; she adorns her temple like a salon; she even adorns it too much. One would say that she makes a display of her riches; she tries to amuse the eye, to dazzle it, to provoke the sated interest; to appear smart and almost coquettish. . . . To see this style," he adds, "in all its splendour one must go, near the Piazza Venezia, to the Gesú, the central monument of their Society built by Vignola and Giacomo della Porta late in the sixteenth century. The great Pagan Renaissance is continued there—but is altered. The semicircular vaultings, the cupola, the pilasters, the pediments, all the main features of the architecture are, like the Renaissance itself, revived from the antique; but the rest is decoration, and turns to luxury and finery. With the solidity of its site and the roundness of its forms, with the pompous majesty of its pillars surmounted by capitals of gold, with its frescoed ceilings wherein great figures, draped or half-naked, whirl in space, with its paintings enclosed in rich frames of worked gold, with its angels in sculptured relief who spring forward from the ledge of the consoles, this church resembles a magnificent banqueting-hall—some kingly town hall, which decks itself with all its silver, all its glass, its damask linen, its curtains trimmed with lace, to receive the monarch and do honour to its city. . . . Out of all this imposing and dazzling decoration an idea emerges, peals forth its note of proclamation, 'Ancient Rome had united the universe in a single Empire: I revive her power, and I inherit her succession (*Je la renouvelle et je lui succède*). What she had done for the bodies of men I will do for their spirits. By my missions, my seminaries, my hierarchy I will establish universally, eternally, and magnificently the Church.'"

I have used this luminous criticism of the great French writer because it gives just the impression of this wonderful sixteenth-century church, within whose walls Bernini may have listened to those sermons of the famous Jesuit preacher, Padre Oliva, which he illustrated with drawings which survive. This very fact shows how intimately the Jesuit teaching affected his later life; but it is in his systematisation of the colonnade of S. Peter's that this conception of the grandeur and universality of the Church of Rome, which had slowly penetrated his consciousness, finds a definite architectural expression.

"The wide protecting arms, solemn and pitiful as those of Jesus," wrote Fraschetti of those wonderful Bernini designs, which I have already had occasion to notice, "are extended to the fascinated multitude in a majestic circle that seems to enclose the world. The vast piazza, closed in by countless marble columns, animated by the gush of the fountains that gleam with their silvery foam, dominated by the massive obelisk of Sixtus V., pure and severe in its classic lines, is the great courtyard which worthily prepares us for the visit to the supreme temple. . . . This miracle," he adds, "was created by the genius of that portentous magician, Gian Lorenzo Bernini. . . . The colonnade of S. Peter's, simple in its lines, sober in its decoration, is his architectural masterpiece."

But perhaps it is in his later creation of the Cathedra, the Chair of S. Peter, that we come closest to the spirit of his age, that the "fervour of his soul escapes on the wings of the fantastic and the improbable."

"In these bronzes which undulate into the air, in the columns twisted beneath the great cupola, the 'colossi' who support with their forefinger the chair of S. Peter gleaming with gems; in the gladsome angels of bronze and all this refulgent glory of cherubs and angel forms among the cloud and rain of gold, in all that tremendous furnace and flame of gold there reveals itself, together and along with the pomp of the Catholic and Apostolic Roman

† See our issues for November 26 and December 31, 1915.

Basilica, the ideal of Jesuitism, trying to subjugate the masses beneath the majestic fascination of the grandeur and glory of the Papacy.”

This interesting passage of Fraschetti seems to give a very valuable support to my contention; because we have here the famous biographer of Bernini, in a work which is essentially devoted to his artistic creation, discovering in this crown of his achievement in S. Peter's the influence of the great Society of Jesus, seeking to impress with the splendour of Rome, the mighty tradition of her hierarchy, the docile and admiring crowd.

But this was only one side of the movement which sought to catch all the life of the time within its wide net. The other, and far more attractive to the higher and more spiritual minds, and one which appealed strongly to our artist, was that of mysticism; and here we have a whole group of monumental sculpture—“The Ecstasy of Santa Teresa,” the “S. Jerome” and the “Magdalen” of the Capella Chigi at Siena, the “Beata Albertona,” the “Angels of the Passion,” designed for the bridge of S. Angelo, which illustrate very completely this side of the master's sentiment.

Above all, the “Santa Teresa,” which to the lover of Bernini must always remain as one of the typical creations of his genius.

Technically we find again here the mastery over the marble which he admired in the “Daphne,” the “Costanza Buonarelli,” the bust of “Cardinal Scipione,” but inspired now by a different sentiment, and aided by a wider knowledge of architectural decoration.

It has been my privilege from time to time within the pages of the *Builder* to call attention to the claims of architectural sculpture, claims which are only now beginning to be understood, at any rate in British art. Bernini, himself a sculptor and architect in one, understood this side of his art completely. He designed his single figures or groups, such as his Papal monuments, the “Constantine,” the “Albertona,” the “S. Teresa”—definitely with a view to their *locale* and lighting; in this last-named group especially the light is very skilfully planned to heighten the emotional effect by falling full on the recumbent form, the upturned face of the swooning saint.

She is depicted here in the moment of ecstasy when Divine Love, in the form of a beautiful young angel, is about to pierce her heart with his flaming dart. She sinks back overwhelmed at the lovely vision; even the draperies here in their sharp accentuated folds seem instinct with emotion, her whole attitude, her closing eyes and parted lips, her hands (those exquisite hands of Bernini), and lovely naked feet extended in utter abandonment, and the poise of her whole sinking body seems one of almost physical rapture.

The French critics, from De Stendhal to Zola, have not failed to note this point. “Sainte Thérèse,” writes De Stendhal, “is represented in the ecstasy of divine love; her expression is the most living and most natural. An angel who holds a dart in his hand seems about to uncover her breast to pierce her heart. He regards her smiling with a tranquil air. What a divine art! What a pleasure to behold!” And Taine—“We returned by Santa-Maria della Vittoria to see the Sainte Thérèse of Bernini. She is adorable; falling back, fainting with love, her hands, her naked feet drooping, her eyes half closed, she sinks away from happiness and ecstasy. Her face is thin but noble in type. This Bernini has discovered here modern sculpture, which is founded on expression, and to complete his effect has arranged the light so that it should pour on this delicate pale face an illumination which seems that of the inner flame, so that through the marble which seems to breathe transfigured to life we see the light of the soul immersed in happiness and rapture.” Emile Zola, in his “Rome,” goes even further:—“Une vierge ignorante et pure, et qui brisée de volupté ouvre languissement les yeux . . . encore pâmée. . . . Ah, cest á mourir!”

But there is no need to insist too much upon this point. Bernini had to represent a psychical phenomenon in terms of material form; he had to thus translate spirit to matter in terms which would be comprehended by an age which enjoyed the erotic romance of Cav. Marini as much as the mystic theology of Molinos; and quite apart from this, as Dr. Weibel justly points out, his treatment of the scene is accurately drawn from the saint's own account of the vision that came to her, as described in her autobiography.

Colossal Statues of S. Andrew and S. Helen: S. Peter's, Rome.

There can be no doubt that this wonderful group expressed in plastic art a movement of the spiritual life which affected very deeply the Rome of Bernini. Theresa, the Saint of Contemplation, had become a symbol of this new movement of the soul's life.

> “*Dum tota fervet intimis medullis*
> *Teresa, crescit et coruscus ignis,*
> *Amore flante Numinis.* . . .”

These are the words of a poet of this period, a period of which Taine, still speaking of Bernini's S. Teresa, remarks:—“The commentary of such a group as this is in the contemporary works on mysticism in the famous ‘Guide’ of Molinos, republished twenty times in twelve years, and which from one palace to another in this idle city of Rome conducted the souls, by the intricate by-paths of a new spirituality, even to love without a lover, and yet further still. While the lofty faith of Spain consumed itself in its Catholicism, like a taper in its flame, and prolonged the feverish enthusiasm which had fired S. Ignatius and S. Theresa, more sensual Italy, taking out the thorns of devotion, drank in its odours as a full-blown rose, and . . . accommodated religion to the voluptuous sweetness of its morals and its sonnets.”

In a fascinating romance which appeared some thirty years ago the hero, an English cavalier, coming to Rome indirectly under the Jesuit influence, becomes himself infected by this new view of the spiritual life, and comes to know personally its creator. “This was Michael de Molinos, a Spanish monk, who, coming to Rome some years before, began to inculcate a method of mystical devotion which he had no doubt gathered from the followers of St. Theresa, who were regarded with great veneration in Spain, where the contemplative devotion which they taught was held in high esteem. . . .

To all who came to him for spiritual comfort and advice he insisted on the importance of mental devotion, of daily communion, and of an inward application of the soul to Jesus Christ and to His death. So attractive were his personal qualities, and so alluring his doctrine to minds which had grown weary of the more formal ceremonies and acts of bodily penance and devotion that thousands thronged his apartments, and ‘the method of Molinos’ became not only a divine message to many, but even the fashionable religion of Rome.”

I have dwelt thus fully on the group of S. Teresa, because it expressed an influence which we may certainly believe was part of Bernini's later life. Like this Cavaliere de S. Giorgio in Shorthouse's romance of “John Inglesant,” he, too, may have shared in “the act of devotion, which is called the contemplative state, in which the will is so united to God and overcome by that union that it adores and loves and resigns itself up to Him.”

There are other figures in which his new sense of the inner life finds expression, notably in the “Beata Albertona,” caught up like Teresa herself in the ecstasy of the Divine Vision, or in those lovely angel forms of the Bridge of Sant' Angelo, two of which were placed by Clement IX. in S. Andrea della Fratte.

But I have preferred to speak in detail of the S. Teresa in this side of his art as the most typical, the most supreme in technique, the most lovely in conception. These influences within his art—the message of the marble beauty of the antique world, reaching him as truly as to any Humanist or Quattrocento artist, the fascination of nature and expression of character, the humour of life exhibited in his Carnovale comedies and caricatures, the glory of Rome symbolised in her triumphant Papacy, lastly the inner message, the act of devotion which enters “into the life of God, into the heavenly places of Jesus”—all these are elements within this complex life of Gian Lorenzo Bernini, and all find their utterance within his art.

In the last years of his life he came more and more under the influence of religion, into the intimacy of the great Jesuit preacher, Padre Oliva. Of his painting of “Christ Crucified” at this time he tells his son:—“In this work I have drowned my sins, and Divine Justice will find them washed by the blood of Christ.”

But his art is always broadly human; and the epitaph, still upon his house in Rome and set there after his death, expressed truly the character of a life work “before which Popes, Princes, and peoples alike bowed the knee.”

S. B.

◆

SLATE TRADE PROSPECTS.

Mr. J. Issard Davies, upon being re-elected chairman of the Carnarvon Harbour Trust, said it was a common thing to say that the slate trade was played out. It was nothing of the kind. It was true that substitutes had been placed on the market, but they had never stood the test. In the last gale of all the only roofing that stood was Carnarvon slates. He hoped, therefore, that the slate quarries would clear for action.

THE SURVEYORS' INSTITUTION.

AN ordinary general meeting of the Surveyors' Institution was held on the 10th inst. at No. 12, Great George-street, Westminster, S.W., Mr. J. H. Oakley, Vice-President, in the chair.

The minutes of the previous meeting were read and confirmed.

It was announced that seven donations had been received for the library in addition to four donations of two guineas each, and it was agreed that the thanks of the Institution be sent to the donors.

Mr. R. M. Kearns (Fellow) then read a paper entitled "Some Notes on Reinforced Concrete," in the course of which he submitted the following notes on reinforced concrete structures. Starting with H.M. New Stationery Office, a building which has attracted much attention, he quoted, with the permission of the Commissioners of H.M. Office of Works, the following extracts from the specification :—

"*River or Pit Ballast.*—To be free from sand and dust, must not contain any traces of calcareous, argillaceous, or other foreign matter, and to be broken into various sizes, so that all shall pass a ¾-in. mesh and be retained on a ¼-in. mesh. The sand to be screened out of the ballast, all passing the ¼-in. mesh to be reckoned as sand.

Sand.—To be freshwater, river, or pit sand, absolutely clean and sharp, properly graded and varied in size; all passing a ¼-in. mesh, and at least 75 per cent. passing an ⅛-in. mesh.

Cement.—The cement shall be Portland (slow-setting) to comply with the British Standard Specification (1910) for Portland cement. The builder is to provide with each consignment the maker's certificate of quality, but such certificate is not to be taken as conclusive. Such tests as the architect may direct will be made from time to time, and no consignment is to be used until the architect has signified his approval. The builder is to deliver consignments in advance for use, so as to permit of twenty-eight-day tests being made without causing delay in the progress of the work.

Formwork.—The whole of the timber centering, etc., used for the formation of concrete work is to be constructed in a solid, rigid, and substantial manner. The centres to be so formed that they may be removed in portions without shaking or jarring the concrete. To be wrought thicknessed and close-jointed, except where walls and ceilings will be plastered, and also to all external work where boarding, rough from the saw and close-jointed, is to be used. No part of the centering is to be removed until the concrete is thoroughly set, and until the consent of the architect has been obtained. The formwork is to be thoroughly cleared of shavings and rubbish, and must be hosed out before the concrete is deposited.

Concrete.—To be made up as follows :—

Cement	1 cwt.
Sand	2 cubic ft.
Ballast	4 ,, ,,

To be sufficiently watered and mixed thoroughly in an approved mechanical appliance to the satisfaction of the architect. Test cubes, 6 in. by 6 in. by 6 in., of the concrete are to be mixed by the builder from time to time as the architect may direct. These cubes are to have an ultimate crushing strength of 1,800 lb. per square inch at twenty-eight days. The concrete to be deposited in layers not exceeding 3 in., unless otherwise permitted by the architect, and to be properly punned and consolidated. The reinforcement to be completely surrounded and covered. No traffic on or over the concrete to be permitted until it is thoroughly set. It is to be protected from frost, inclement weather damage, or too rapid drying, and kept well wetted. No steel, except binding rods or stirrups, is to be nearer than 1½ in. to the external face of concrete, except in thin floor slabs, where the cover may be reduced to ¾ in. No concrete to be used which has been left standing and begun to set. Floors and roof to be finished smooth with a rule. The roof slabs to be laid to fall.

Granolithic Finish.—The upper ½ in. of floors (except where otherwise specified) to be formed of one of cement to two of approved granite chippings to pass a ¼-in. mesh, and to be free from dust. To be laid while the reinforced concrete is green, and to be trowelled off within an hour of laying. This surface finish to be in addition to the structural part.

Steel.—To be obtained from firms approved by the architect, and to be of such quality as to withstand the following tests :—The ultimate tensile strength lengthways with the fibre is not to be less than 27 tons, and no more than 32 tons to the square inch. Specimen pieces of steel are to be bent cold until the ends close over a bar, the diameter of which is the same as that of the piece to be tested. The steel rods throughout are to be of the exact lengths and diameters shown on drawings. No welding or piecing of rods will be permitted, and they are to be bent where required to templates and while cold. After such smiths' work as may be required on the rods has been completed, the steel of which they are formed must present a smooth surface free from seams, flaws, or cracks. Great care is to be exercised in the fixing and maintenance—during the placing of concrete—of the steel rods in the exact positions shown on the drawings, and in securing the links and stirrups by which the rods are to be connected together in the positions shown for them, so that the position of the reinforcement in the finished structure may exactly correspond with the position as designed.

External Finish.—Render the reinforced concrete work where exposed externally with Portland cement and sand in the proportion of one of cement to three of sand, ½ in. thick, finished with an approved floated face. The finishing coat to be applied before the backing is thoroughly set. The concrete is to be hacked to form a sufficient key for the rendering, and is to be cleaned and thoroughly wetted before the rendering is commenced.

Boiler Chimney.—To be lined to a height of 50 ft. with approved Staffordshire firebricks laid in fireclay, with all joints well flushed up. To have 1½ in. air space between the firebrick and concrete, ventilated as directed. The chimney is to be built clear of the building, as shown on drawings.

Flues.—Smoke flues in chimney-breasts are to be formed of terra-cotta pipes 10 in. in diameter and with butt joints."

Bills of quantities were prepared, from which a schedule of prices was made for the adjustment of variations. The most important items were, briefly, as follow :—

Excavation from general area over site	At different depths.	Per yard cube.
Ditto, in pier holes ..	,,	,,
Planking and strutting ..	—	Per ft. super.
Ferro-concrete (steel taken separately) :—		
In footings to columns ..		Per yard cube.
In columns to basement and sub-ground floors		,,
In ditto to other floors (each floor kept separate)		,,
In sub-ground and ground floor and in beams to same		,,
In other floors and in roof (each kept separate) ..		,,
In external walls at various levels (one item)		,,
In internal ditto ditto (one item)		,,
In area walls		,,
In chimney and foundations to same (one item)		,,
In bridge (one item)		,,
Steel bars prepared and hoisted (one item)		Per ton.
Formwork :—		
To columns, internal or external (one item)		Per yard super.
To floors, including beams (sides of beams, etc., not measured but covered by price) (one item)		,,
To staircase (measured on girth of riser and soffite) ..		,,
To chimney		,,
To internal and external walls (one item)		,,
To bridge (one item)		,,
To retaining walls (measured both sides and on the flat)		,,
To mouldings (excepting to columns)		Per foot super."

Proceeding, the author said :—

"I have omitted the prices advisedly. The schedule from which the foregoing items were taken does not coincide with the "Standard Method of Measurement" now recommended for general adoption, but it answered its purpose satisfactorily, and had the "Standard Method" been framed in 1911, when the erection of the New Stationery Office was begun, I doubt, in view of the large quantities of materials involved, whether the concrete required for this building would have been billed in "feet cube" or the steel in "pounds."

A short time ago I saw the bills of quantities for reinforced concrete in connection with a large industrial building, and found that the quantities had been prepared somewhat on the lines of the "Standard Method" from complete drawings, showing reinforcements and other work. Bills of quantities such as these may be admirable so far as they enable contractors to prepare close estimates when tendering, and also in regard to the data they provide for the accurate—though perhaps unnecessarily elaborate—admeasurement of variations, but I think they are incomplete if they fail to give the contractors the total quantity of concrete in "cubic yards," and that of steel in "tons." It may be argued that the contractors themselves are able to calculate these totals from the details given, but it is not fair that they should be called upon to do so, and it would be better for all parties if the calculations were made by the quantity surveyor. If such totals were furnished, in addition to the detailed quantities which only should be priced, the contractor whose tender is accepted could at once make arrangements for obtaining his materials. Further, it is held by estimators that these total quantities are essential and important factors in arriving at the detailed prices on which the tender is based. The contractors would also ascertain the quantity of cement from that given for the concrete. On the proportions of 1 + 2 + 4 they would probably calculate at the rate of 1 sack of cement to ⅓ cubic yd. of concrete. Thus the number of yards multiplied by 3 would give the required number of sacks of cement; dividing this number by 11 (where each sack weighs about 204 lb.) the cement would be shown in tons.

The grand totals to which I have referred would also show the ratio of steel to concrete—generally about 2 cwt. of steel for 1 cubic yd. of concrete—from which the average cost of the complete reinforced concrete, at per yard cube, could be ascertained and, on occasion, made use of when measuring for certificates in respect of advances. In this connection the surveyor would allow about 60 ft. super. of formwork for every yard cube of the finished concrete.

It may be interesting to note that the proportions of the concrete for the industrial building to which I have alluded were 1 cwt. cement, 2¼ cubic ft. of sand, and 4½ cubic ft. of aggregate, as against 1 + 2 + 4, the slightly richer brand adopted by the Office of Works."

The lecturer then proceeded to give some particulars of the New Science Museum, South Kensington, after which he went on to say :—

"Pronouncements are invited on the following points, about which there is diversity of opinion among experts :—

While some authorities allow the formwork to be covered with a wash of lime before the concrete is deposited, in order to ensure good surfaces when the centering is struck, others regard it as unnecessary, and are satisfied if the boards are kept well wetted. And while the formwork is treated with "concrete oil" in some cases, it is condemned in others. It is certain, however, that the formwork should not be oiled if the concrete is to be plastered.

Differences of opinion also exist as to the best means of making concrete waterproof. Experts agree, however, that the concrete should be moderately rich and that the aggregate and sand should be so well graded as to fill, if possible, all pore spaces. The concrete should be mixed and laid with the greatest care, and should be allowed to set and harden before its permeability is tested. Some authorities state that the mixture should be "fairly wet," and that "on no account should a dry mixture be made if intended to be watertight." On the other hand, one authority states that the mixture should be "fairly dry" and "well rammed in thin layers."

Coming to the concrete roof or flat, with its covering of asphalt, the question arises whether the concrete should be finished smooth with a rule, or receive, while it is green, a floating of cement. Either course provides the necessary even surface for the asphalt, which should be applied in two coats, the first being more bituminous than the second. When this method is followed very little trouble arises from expansion and contraction, although, in the case of a very wide flat, unbroken by skylights, it would perhaps be advisable to form expansion rolls in the asphalt. One well-known firm of asphalters prefers to lay the asphalt (two thicknesses of ⅜ in.) on stout canvas nailed to a cement floated surface with zinc nails. It appears that asphalt will adhere very firmly to concrete walls or flats if the surface of the concrete is first painted with coal-tar. The latter should be "heated in small quantities, brought just to the boiling-point, and then applied immediately."

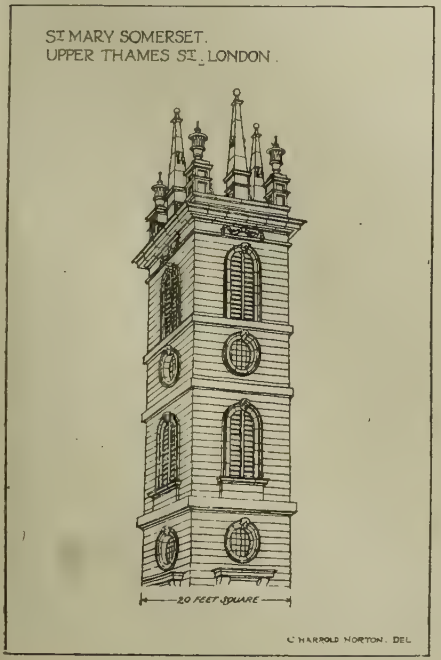
With regard to the various "systems" of reinforcing concrete, can it be declared whether there is cause or just impediment why the rods in beams should not be slightly larger in section and fewer in number? It certainly seems feasible that they should in no case be nearer to each other than 2 in. in order that it may be tolerably easy for the concrete—not thinned out, but containing its proper proportion of aggregate—to "surround" the reinforcements, and thus have a chance of doing its full work."

After making allusions to the new ferro-concrete cathedral at Demerara from particulars given in our issues of November 13, 1914, and December 17, 1915, Mr. Kearns concluded by saying :—

"Let us see to it that our reinforced-concrete buildings are as beautiful as art can devise and funds permit. Mistakes have been made in the past; they have taught us much, but there is still much to learn. We must, therefore, press on to a fuller knowledge of this wonderful building material—of the science that governs its construction and the art with which it should be applied. Difficulties will confront us, but they will not be so formidable that they cannot be overcome.

The distant mountains that uprear
Their solid bastions to the skies,
Are crossed by pathways that appear
As we to higher levels rise."

A vote of thanks to Mr. Kearns for his paper was proposed by Sir Henry Tanner, who made reference to some further interesting facts relating to the construction of both H.M. New Stationery Office and the New Science Museum, South Kensington. The vote of thanks was seconded by Mr. George Corderoy, and supported by Professor Henry Adams, Mr. Hy. Lovegrove, Mr. T. J. Carless, and Mr. J. H. Blizard.



ST MARY SOMERSET.
UPPER THAMES ST. LONDON.
20 FEET SQUARE
C HARROLD NORTON. DEL

The Chairman announced that the Council had tried to meet the difficulties under the present war conditions not only by altering the time of meeting from eight to five o'clock, but also by reducing the number of meetings, which in future would be held once a month instead of once a fortnight. The next ordinary general meeting of the Institution will be held on Monday, February 7, at 5 p.m., when a paper will be read by Mr. C. F. Slater entitled "Practice in Assessing Dilapidations."

◆

THE LONDON CHURCHES OF WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

No. III.—The Demolished Churches.

ELEVEN London churches escaped the Fire, of which eight still remain, namely, All Hallows, Barking, close to Trinity-square; St Andrew's Undershaft, at the junction of Leadenhall-street and St. Mary Axe; St. Bartholomew the Great, West Smithfield; St. Ethelburga, Bishopsgate; St. Giles, Cripplegate, in Ford-street; St Helen's, Bishopsgate; St. Katherine Cree in Leadenhall-street; and St. Olave's, Hart-street, which still afford some idea of the London churches anterior to the Great Fire. Thirty-five churches were not rebuilt after the Fire, their parishes being united with those of other churches; but of the forty-nine churches rebuilt from Wren's designs within the City of London, fifteen had been demolished before 1907 to make room for other buildings. St. Christopher le Stocks was pulled down to enlarge the Bank of England in 1781; St. Michael, Crooked-lane, was destroyed when the new London Bridge was built; St. Bartholomew by the Exchange, to provide room for the Sun Fire Office; and in 1841 St. Benet Fink was destroyed on the rebuilding of the Royal Exchange.

More churches were pulled down in consequence of the Union of City Benefices Act, and, although the opposition to further destruction is stronger to-day than it was formerly, the danger of further demolition must always be a very great one, because of the immense value of the sites and the need of funds to provide churches in outlying districts where the increase of population has been rapid. But it is to be hoped that the churches which remain will be preserved, since the value of their sites, great as it may be, is small compared with the value of the historic associations of the buildings, forming a link, as they do, with the old London of history. Apart from this, their value as architectural monuments is enormous, as we should realise by imagining Ludgate-hill without St. Martin's, Cheapside without St. Mary-le-Bow, and Fleet-street without St. Bride.

The position of the towers in some of Wren's churches seems ill-chosen, as in many cases they are hidden away in the least prominent position of the sites, the explanation being that as far as possible an endeavour was made to build the new towers in the same position as that occupied by the towers of the churches which formerly occupied their sites.

Among the churches which have been pulled down, few were so interesting as St. Antholin and St. Benet Fink, which we illustrate in this issue from drawings published sixty years ago. The *motif* of St. Mary Abchurch and St. Mildred is the circular dome resting on pendentives; the two churches we illustrate are based on the ellipse, in one case expressed externally by an elongated polygon, in the other partly carried out in a similar way. In both of them the internal conception of design appears to have controlled the external treatment and determined its lines, and they must have been buildings of exceptional interest and charm.

The ellipse is of all forms in architecture one of the most difficult to treat satisfactorily, and for that reason and the constructional problems involved has rarely been indulged in by English architects; while it became, of all curves, the most favoured in many phases of the French Renaissance. The spacing of a colonnade on the curve of an ellipse becomes a complex problem, unless the curve is one of considerable size, as the spacing which is satisfactory and effective in the flattened sides usually appears too wide when employed at the more rapidly curving ends, while any decoration involving concentric elliptical lines is extremely hard to arrange with any degree of satisfaction, since no two true elliptical curves can be completely parallel with one another, which renders the designer's task a hard one. Wren's mathematical tastes frequently led to his complicating a problem in order to have the pleasure of solving it, and these two churches are interesting examples of this tendency, which is more clearly shown in them than in any of his existing churches. The tower and spire of St. Antholin was among the finest of the simpler forms designed by the architect, and, with that of St. Mary Somerset, shows the use of a purely Gothic form, carried out with Renaissance detail. The church of St. Mary Somerset, which stood in Upper Thames-street at the south-east corner of Lambeth-hill, was built in 1695, but only the tower has been preserved.

◆

ARCHITECTURAL SOCIETIES.

The Birmingham Architectural Association : The Palace of Knossos, Crete.

The fifth general meeting was held at the Association's rooms on Friday, 7th inst., the Vice-President (Mr. W. A. Harvey) in the chair, when Mr. Theodore Fyfe, F.R.I.B.A., read a paper on the subject of "The Palace of Knossos, Crete," illustrated by numerous lantern slides.

The lecturer mentioned the fact that he had been present for a considerable time during the unearthing of the palace, so that the audience might know that the observations he was about to make had been acquired first hand and had not been procured from books. It was pointed out that although the discoveries in this particular place could not claim to have revealed much that was of great architectural value in themselves, nevertheless they did throw considerable light upon a somewhat hazy period in the history of architectural development. The period, roughly between 2000 and 1500 B.C., saw the rise and fall of the highest attainments in ancient Crete. There were abundant proofs that Crete, one of the "islands of the seas," was at one time subject to Egypt; but there was little of Egyptian influence to be found, clearly indicating that the peoples of Crete were sufficiently developed in themselves to possess quite a distinctive style of their own in matters of dress and arts and crafts. The discoveries of representations of natural objects in plaster, pottery and fresco showed an unconventionality and vitality which was truly surprising considering the early date at which they were executed. An almost humorous note was struck by some of the slides representing clothed female figures, in that, while viewing them, the imagination was almost tricked into fancying that one beheld modern illustrations of the "latest Paris fashions." An explanation was given and views placed upon the screen to illustrate the methods adopted for the excavation and preservation of the remains of the Palace of Knossos. The plans of this palace, and of others on the island, revealed some curious zig-zag, maze-like methods of planning. The basis of the wall construction was mainly of mud, which was, in many cases, lined, where exposed to the weather, with lime-stone slabs and internally with slabs of gypsum as a dado, with fresco pictures framed in wide borders of design on what might be termed the general eye-line. The mud walls were usually strengthened by built-in wooden posts and beams, while occasionally lime-stone blocks were used for the same purpose. Indications as to the general architecture of the period of the erection of the palace, apart from the remains, could be gathered from fresco representations and from the several delightful little porcelain models of houses which had been discovered.

A vote of thanks to the lecturer was proposed by Mr. Edwin F. Reynolds, seconded by Mr. E. E. Bateman, and supported by Messrs. W. Doubleday, W. Haywood, B. Walker, and the Chairman.

GENERAL NEWS.

Professional Announcement.

Mr. R. Stephen Ayling, F.R.I.B.A., has removed his offices from 8, Dartmouth-street, Westminster, S.W., to Bedford House, 8, York-place, Baker-street, W. His new telephone number is Mayfair 4522.

Appointment.

The Minister of Munitions has appointed Sir Howard Frank, head of the firm of Messrs. Knight, Frank, & Rutley, to be Hon. Adviser on Land Valuation to the Ministry.

The Royal Institute of British Architects.

The Council of the R.I.B.A. have decided to remit the subscriptions and contributions due on January 1, 1916, of all members and Licentiates serving with the Forces who make a written application for such remission before July 1, 1916.

A Shakespeare Tavern.

The "Three Pigeons" at Brentford market-place, an old Elizabethan inn, has been closed as redundant under order of the Middlesex licensing justices. It was the resort of the poets and dramatists of the Elizabethan era.

Admission to Kew Gardens.

Concrete foundations have been prepared at all the gates at Kew Gardens, and some of the turnstiles have been placed in position. When the work is completed the charges for admission will come into force.

St. Margaret's Chapel, Edinburgh.

In connection with the provision of new stained glass windows for St. Margaret's Chapel, Edinburgh Castle, Mr. Douglas Strachan, the artist in stained glass, offered to replace the five windows in the chapel. The one condition he laid down was that the Cockburn Association should present £36, the cost of three of the windows, to some war fund.

Housing Problem at Rhos.

At Wrexham Rural District Council recently it was reported that the first group of houses built by the Council for the working classes at Rhos are ready for occupation. Seventy-five applications were received for twenty-two houses, but after the Council had fixed the weekly rent at 5s., plus rates (7s. 5d. inclusive), most of the prospective tenants withdrew.

A New Calendar.

The Val de Travers Asphalte Paving Company, Ltd., Hamilton House, Bishopsgate, E.C., have sent us an artistic little almanac in bronze metal-work. It is an effective production, and includes a perpetual calendar printed in plain figures.

Building Operations in Nottingham.

Five hundred and eighteen new buildings, including dwelling-houses, of which 155 were certified for occupation, have been erected in Nottingham in 1915. Amongst them have been six public buildings and half a dozen warehouses and factories. Ten other big buildings are now in course of erection.

London Water.

Attention was called at the meeting of the Metropolitan Water Board on the 7th inst. to the fact that the number of "first class" samples from the New River had fallen to 22 per cent. It was explained that the reason was the deterioration of the raw New River water, and the absence of adequate storage. The provision of adequate storage accommodation was engaging the attention of the Chief Engineer.

Safety of St. Paul's.

The appeal for the fund to strengthen the dome supports of St. Paul's Cathedral is being renewed. At least one of the massive piers supporting the dome shows alarming tendencies, it is stated, and work which has already been begun on it has revealed signs of internal crumbling. The danger is described by Canon Alexander as being caused by "senile decay, accelerated by the gradual pressure of the dome, the rusting of iron, and internal degeneracy of the extremely inadequate repairs executed at some earlier period."

Destruction by the German Army in Belgium.

The *Times* correspondent in Paris has communicated the following to that journal:—The Belgian Government has compiled statistics as to the destruction wrought by the German Army in Belgium. The total number of houses and public buildings destroyed is 18,207, and details with regard to Flanders, Limburg, Hainhault, and Luxemburg are lacking. The destruction was most complete at Spontin, where 127 out of 130 houses were burnt to the ground, and at Dinant 1,263 out of 1,375. At Louvain, 1,120 out of 7,433 houses were destroyed, while 1,000 houses were pillaged.

Houses Wanted for Workmen.

At their meeting on the 6th inst. the Highways Committee of the Goole Urban District Council had before them a letter from the Elswick Works, Newcastle-on-Tyne, asking, in connection with the building operations at Barlow, near Selby, if there were any prospects of housing from 100 to 200 skilled workmen in six to eight months' time. The Committee decided to reply, stating that at present there were a large number of vacant houses in the town, and also that they had forwarded the information to the local builders.

Trade after the War.

A Guildhall meeting, called by the Lord Mayor of London to consider the question of "Trade and Employment after the War," is to be held on Monday, January 31, at three o'clock. The Lord Mayor will preside. The meeting has been promoted jointly by the London Chamber of Commerce and the National Patriotic Association, both of which bodies have for many months been considering the industrial and commercial problems which will arise when the war is over. The Lord Mayor is anxious that the meeting shall be thoroughly representative, and he invites the co-operation of the Chambers of Commerce, patriotic bodies, employers' federations, trade organisations, banks, railway companies, etc., in all parts of the country. Inquiries may be addressed to the Hon. Secretaries, Patriotic Meeting, Mansion House, London, E.C.

Fire Losses in 1915.

Fires in the United Kingdom during December were far more costly than in any previous month of the year, largely owing to a number of serious outbreaks during the last few days of the month. Taking into account only fires in which the damage amounted to £1,000 or more, the total cost of the fires during December may be put at £633,000, which compares with losses of £365,000 in November last and £353,000 in December of 1914. On the same basis, the total cost of the principal fires in the United Kingdom during 1915 amounted to £4,207,100 as against losses of £3,745,100 in 1914 and £3,630,400 in 1913. A feature of the experience last year was a number of fires in factories engaged on Government work of various kinds.

Aberdeen Building Trade.

The statistics as to the extent of building in Aberdeen during the past twelve months, for the period from December 1, 1914, to November 30, 1915, show a considerable decrease both in value and the number of plans. The total value of the new buildings, alterations, and additions sanctioned during the year by the Plans Committee of the Aberdeen Town Council was £57,683, as compared with £101,912 in 1914—a decrease of £44,229. The total, which is little more than half of last year's aggregate, includes £15,825 on dwelling-houses, £12,550 on factories and workshops, £6,355 on shops, offices, warehouses, and other business premises, and £21,872 on additions and alterations to buildings. The number of new buildings erected, and additions and alterations carried out was 174, as against 214 in 1914.

National Building Code for Scotland.

An important piece of constructive work in the direction of creating conditions favourable to the resumption and expansion of trade after the war has been achieved by the establishment of a national building code for Scotland. The object of the code, which has just been published by the Stationery Office, is to ensure uniformity of practice in entering into and carrying out building works, from the preparation of the schedules of quantities on which the contractors' tender is based to the payment of the final balance. It is doubtful if anything quite so ambitious in regard to building has been previously attempted on a national scale, and Scotland is believed to be the first country in which it has been done. Up to the present practices have been widely divergent, Edinburgh, Glasgow, Dundee, and Aberdeen each having its own local rules and customs, a state of affairs which has given rise to much confusion on the part of building owners and contractors who conduct business in all of these cities.—*Scotsman.*

The Building Trade in Leeds.

The building trade in Leeds has found itself in the position of many other industries during the past year. While the ordinary branches of building activity have been much restricted from financial considerations, builders on the whole have experienced some compensation from the abnormal erection and extension of engineering works for the purpose of augmenting and accelerating the supply of munitions. The value of building work done in the city is almost up to that of the previous year, though the number of dwellings erected maintains the appreciable shrinkage which has set in since the war began. It is the speculative builder who has suffered the brunt of the burden, for he has had to face not only an increased cost of material and labour, but has had to contend against a largely increased rate of interest on borrowed money, circumstances which have conspired to cripple his business. The estimated value of buildings shown on plans approved by the Corporation for the years ended November 30 was £445,844, as compared with £459,908.

"Mechanical World" Year-Books.

We have received from Messrs. Emmott & Co., Ltd., 65, King-street, Manchester, copies of the *Mechanical World* Pocket Diary and Year-Book and the *Mechanical World* Electrical Pocket-Book for 1916. In the first-mentioned publication the publishers have introduced various new features in this, the twenty-ninth issue of a very useful little book. The section on steam boilers has been largely re-written and much additional information introduced, including particulars of boiler scantlings, the requirements as to boiler mountings, etc. Among the new features of the present issue of the Electrical Pocket-Book is a lengthy section on switch gears and switch boards. The section on lighting circuits and switching has been revised and additional illustrations introduced. Both these handbooks are published at 6d. net each.

Renumbering Specifications on Publication.

We have received from Mr. W. Temple Franks, Comptroller-General, the following notices, which will appear in the *Illustrated Official Journal* (*Patents*) of January 12:—In order to give the public the advantage of having abridgments of specifications up to date while retaining their numerical sequence, applications for patents made subsequent to 1915 will be given new numbers when their complete specifications are accepted or become open to public inspection before acceptance. The new numbers will start with No. 100,001 (without any indication of date), and will supersede the original application numbers in all proceedings after acceptance of the complete specifications. It is intended in future to issue abridgments of specifications in the *Journal* a few weeks later than that in which their acceptance or publication is advertised, so that they will be available for search purposes soon after the printed copies of the specifications are on sale; but, until the system is fully in force, they will only be issued when there are sufficient to make up a full sheet of sixteen pages. The present series of abridgments will run concurrently with the new series in the *Journal* until April, 1917, when it will be entirely superseded.

CORRESPONDENCE.

Architects and Munitions of War.

SIR,—The Royal Institute has been informed by the Ministry of Munitions that there is a serious deficiency in the supply of skilled men for work in munition factories, and that this deficiency is particularly marked in respect of tool-setters. The demand for such skilled workers is altogether greater than the supply at the present time; consequently it is imperative that suitable men should be trained at once for the extremely accurate work of setting up automatic and semi-automatic tools. It is necessary to train men for this purpose to a very high degree of accuracy. In the case of the manufacture of machine-guns the limits are in the neighbourhood of one ten-thousandth part of an inch.

The experience gained from the professional men who are already assisting in this work proves that the most suitable men to be trained are of the more highly educated type. Arrangements have accordingly been made by the Ministry of Munitions for training men of this type. Such men will be given a course of training lasting two or three weeks, during which they will be paid £2 a week, and they will then be drafted straight into factories where they are most urgently required, and where they will be paid the standard rate of wages for the district for tool-setters. This rate varies from £3 10s. a week to £5, according to the district.

The Selection Committee of the Architects' War Committee have been informed of this need and have the matter before them in connection with the War Service Forms of those architects who are over military age or unfit for military service.

ERNEST NEWTON,
President R.I.B.A., Chairman Architects' War Committee.

Factory and Commercial Property Sales, 1915.

SIR,—On the year under review we are pleased to report that the sales and letting of factory property, wharves, land, etc., show far better results than was the case in 1914. This result is in a large measure due to the war, which has produced a great demand for factories and commercial property of all descriptions.

As we anticipated in the early stages of the conflict, a demand would be created for factories, due primarily to the requirements of the Government for the manufacture of the necessary war equipment for our fighting forces, and, secondly, for the manufacture in this country of goods previously imported.

We are glad to say this forecast has been realised, and the nation's immediate wants have necessarily demanded extra pressure of manufacture, which created a necessity for the opening up of factories as well as the extension of present ones to cope with the enormous requirements of the country. We are able to report that we have disposed of a large number of factories with and without plant and machinery, at figures running into many thousands of pounds, and that an unprecedented demand still exists for properties of all kinds.

Premises that previous to the war had failed to find tenants for years have been rapidly taken up, owners in many cases having obtained, through competition, increased prices to those asked.

It is interesting to record, on analysing the demand for factories, that many have been disposed of to the Government, Government contractors in all branches of manufacture, English firms starting to manufacture goods previously imported (now barred through the war), and Belgian manufacturers who largely exported goods to this country, but prevented from doing so now owing to their works having been destroyed by the Germans.

To say the Industrial World of England is busy is a mild term to use; it is in the throes of a boom, and so far as one can judge is likely to be for some years to come.

The declaration of peace should mean the opening up by our manufacturers of an enormous overseas trade with our Colonies, new possessions, and the world's markets in general, and then will come the time for us to "capture the trade" hitherto to a large extent held by the Germans.

We can safely say the outlook for further deals in factory property is good, and think we are justified in hoping to report a continuance of the demand and supply of commercial properties of all descriptions in the present year, not only for the purposes of occupation by manufacturers, but as investment by trustees and others seeking a good, sound, improving security.

LEOPOLD FARMER & SONS.

◆

MEMORIAL TABLET, FALMOUTH.

The Royal British Colonial Society of Artists have erected a tablet in the Church of King Charles the Martyr, at Falmouth, to the memory of Mr. William Ayerst Ingram, founder and for twenty-six years president of the society. The memorial is the work of Mr. Alfred Drury, R.A.

HOME-GROWN TIMBER AND REQUIREMENTS OF THE GOVERNMENT COMMITTEE.

The Home-grown Timber Committee have received a large number of offers of timber. Any lots which are *prima facie* suitable for the Committee's purposes will be inspected as soon as the pressure upon the staff will permit. Meanwhile (says an official statement) it may be of service to landowners, agents, and others to know that the classes of growing timber at present principally required are:—Acots and Corsican pine, silver fir, Douglas fir, and larch of good dimensions, and in lots of about 20,000 cubic ft. and upwards. Plantation ash of fair size, which will be accepted in comparatively small lots. Other hardwoods of good dimensions are also required; but, as a rule, these cannot be considered in small lots. The Committee are also prepared to enter into arrangements with the owners of estate sawmills for the conversion of timber. The Committee would be glad to be informed of sawmill plant that is idle or not fully employed, in order that, if possible, arrangements may be made for increased output. All communications should be addressed to the Secretary, Home-grown Timber Committee, Craven House, Northumberland-avenue, London.

Architecture by Bernini.

THESE illustrations are given in connection with an article appearing on page 44.

St. Benet Fink and St. Antholin.

WE reproduce two interesting plates from "The Churches of Sir Christopher Wren," by J. Clayton, which was published by Messrs. Longmans, Green, Brown, & Longman in 1848, and which we give by the courtesy of Messrs. Longmans, Green, & Co. The two churches are dealt with in our article on page 47.

London University: King's College for Women.

THE new buildings stand in grounds of nearly 3 acres on Campden-hill, and situated between Holland Park and Kensington-gardens. The new establishment owes its origin to the introduction of special courses in Household and Social Science in October, 1908, at King's College for Women, then situated in Kensington-square. These courses were instituted with a view to providing education in science and economics of a university standard, and applying the principles thus taught to the management of the home, the hygienic and businesslike conduct of public institutions, and the employment of women in factories and workshops. The introduction of a Domestic Science course into a university, though looked upon by some as a revolutionary step, is no more so than was the inclusion of Agricultural and Engineering courses into the curriculum for men—an innovation that everyone now admits was justified. The movement has received much encouragement, including the practical interest of the Queen and generous contributions amounting to over £100,000.

The buildings already completed comprise Queen Mary's Hostel, the Refectory, and the Anglesey Laboratories. The Hostel was presented by Sir Richard Garton, and received its present name by permission of Her Majesty. The Laboratories were the gift of Lord Anglesey, and the Refectory was provided by Mrs. Wharrie, who has also contributed largely to the endowment of the College.

The buildings are grouped round a quadrangle, which will be completed in the future by the library and official quarters. They are designed on the lines of late Georgian work, with brickwork of a beautiful colour and texture for the facings, and Portland stone dressings concentrated on the principal features of the buildings.

For the complete training of students in Household and Social Science a residence near the Laboratories is essential in order that there may be adequate opportunities for the practical application of the principles and processes studied. There are sixty bed-sitting-rooms, and separate dressing-rooms for each student, rooms for the Warden, common rooms for staff and students, isolation-rooms, and administrative offices in the residential part of the Hostel, and educational facilities are provided by a large kitchen, pantry, and laundry, equipped with modern appliances for practising the domestic arts, and adapted to the needs of large institutions and small homes; a kitchen laboratory is provided in an adjacent building, and easily accessible from the Hostel; and also in the Laboratory block are accommodated the following departments:—Physics, Physiology, Bacteriology, Hygiene, Chemistry, Biology, Psychology, with the necessary rooms for lectures, preparation, and teaching staff.

The new buildings were designed by Messrs. H. Percy Adams, F.R.I.B.A., and Charles Holden, A.R.I.B.A., architects. The general contractors were Messrs. Wallis & Sons, of Maidstone, who also carried out the ferro-concrete construction from details by Messrs. Mouchel & Partners. The Laboratory fittings were made by Messrs. Baird & Tatlock from the architects' designs. Messrs. Doulton did the plumbing and drainage. The entrance gates and head vases were made by Messrs. Elsley, and all the stone carving was carried out by Mr. Broadbent and lettering by Mr. Eric Gill.

MEETINGS.

MONDAY, JANUARY 17.

University Extension Lecture (at the Victoria and Albert Museum).—Mr. Banister Fletcher on "Renaissance Architecture." 4.30 p.m.

WEDNESDAY, JANUARY 19.

Royal Society of Arts.—Mr. Lawrence W. Chubb on "The Common Lands of London—The Story of their Preservation." 4.30 p.m.

Concrete Institute.—Ordinary general meeting. 5.30 p.m.

THURSDAY, JANUARY 20.

University Extension Lecture (at the British Museum).—Mr. Banister Fletcher on "The Roman Forum." 4.30 p.m.

FIFTY YEARS AGO.

Midland Railway: St. Pancras Station Competition.

OUR readers know that eleven invited architects submitted designs for the proposed new station. The following award has been made:—To Mr. G. G. Scott, R.A., the erection of the building; Mr. G. S. Clarke, premium £200; Mr. E. M. Barry, £100; Mr. T. C. Sorby, £50. The other competitors were:—Messrs. C. P. Cockerell, Darbishire, Lockwood & Mawson, Hine & Evans, Walters & Co., Lloyd, and Owen Jones. The cost of the selected design is estimated at about £280,000.

[⁂ We give the above extract from the *Builder* of January 13, 1866.—ED.]

NOTES AND SKETCHES FROM LONDON VILLAGES:

CHRISTMAS DAY.

IN former times, when the country was less timid in its approach to meet the City, London boasted a chain of rural villages within the six-mile radius. To these suburban retreats—north, east, south, and west—the wealthy City merchant nightly repaired, by chaise, by curricle, by hackney coach, or trusty quadruped, there to enjoy the delights of sweet air and pleasant surroundings. A century ago such places were at their zenith of charm; in Queen Victoria's time the railways welded them to the iron heart of London, and during the last twenty years electric trams, omnibuses, and other improvements have almost obliterated their setting. Yet sufficient of their beauty remains to-day to charm and enlighten the student of history. During the Christmas holidays I made pilgrimage to several centres of eighteenth-century life, trudging through the mud and braving the elements in cheerful quest. Once again in spirit I kept company with Samuel Pepys, creeping unobserved into the spacious coach-and-six which drew him up Highgate-hill to Lauderdale House, adjoining Andrew Marvell's cottage. All the way from London Pepys gossiped of the Dutch menace and the varying success of our fleet under the Duke of Albemarle. Arrived at Highgate, the loquacious secretary vanished into the house and left me standing outside, speculating on the early nineteenth-century additions, which appeared to me as a page from Krafft's book. Pensively I turned to search for Marvell's cottage and groped along the brick wall to find an entrance; alas, nothing remained except the stone threshold bedded deep in the wall! Then my thoughts turned to Cromwell House, opposite, with its cheery waistcoat of seventeenth-century red brick, wrought architraves, and generous cornices. From beneath that archway at the side General Ireton's men have marched, and the old house is quite in accord with the present troublous times, for men at arms are ready on every newel post. Highgate is indeed a place of happy memories. Once on a Christmas-time, when the snow was deep, Bacon stopped his coach on the way to St. Albans to stuff a fowl with snow, and to observe the effects of its preservative qualities. Here he caught a fatal chill. Washington Irving walked these classic ways to visit Coleridge at Highgate. Charles Dickens reverenced every brick of the place. I continued my quest to West-hill. Ah, the spirit of the past surely haunts this favoured spot! There is Holly-terrace, built for Mr. Coutts, the banker, and just below is the famous Holly Lodge, with the elegant conservatory designed by John Papworth. Back once more, through Highgate village, past old inns and wrought-iron signs, peeping at coach-yards long deserted of their former traffic, through Hornsey-lane to see Nash's viaduct, and to experience a sense of chagrin when the iron bridge of single span was reached. I remembered a former Christmas visit to this archway thirty years ago, when workmen were busily demolishing the low stone balustrade to prevent the suicidal tendencies of the community, and to erect in its place a wrought-iron grille through which one peered down into the abyss of the cutting and over the spires of London.

Regretfully Highgate was abandoned; no jovial Boniface awaited travellers at the Gate House Tavern to swear them on the Horns; no blacksmith's hammer rang out merrily from Highgate Forge. Whither? I ruminated, then fancy prompted Muswell-hill. Yes, the rendezvous of the fraternity of St. John of Jerusalem, that must be visited of a certainty. Perhaps I shall see the dairy and farm of the Clerkenwell Templars, or view the Nuns' Chapel, with the image of our Lady of Muswell. There is also a possibility of my inspecting the six old-world residences which I remarked on thirty years ago. Thoughtfully I wended my way through acres of small villas, skirted the leafless woods, and then along paved streets to the historic Pursenhall-hill. The once familiar landmarks had entirely vanished; the old-world mansions had gone into the limbo with the rest. Where, I inquired of an old inhabitant, can I find the Elms, the Limes, Summerlands, Hillside, the Firs, and the Oaks? "Ah, sir," he replied, "they now form part of the foundations of the buildings hereabouts, and their grounds are covered with a hundred shops!" Then my attention was directed to a charming little brick box of late eighteenth-century date. "What building is that?" I ventured. "We have a great affection for that building," my guide replied. "Fifty years ago it was the only trading place in the village—a general store and post-office combined; and it is now an ironmonger's, although in the hands of the same family." How typical of their age these unpretentious shops are, replete with bow fronts and fanlights, with glazing bars undisturbed by fashion, and that air of refined simplicity; and what a contrast in style to the adjacent shop, whose consoles alone would fill the diminutive first-floor room! Proportion was the keynote of that age, and reasonable height to width of front. Eight feet for the shop in the clear, 9 ft. for the importance of the first floor, and 8 ft. for the bedroom above. Those who had the framing of building regulations, let us hope, unwittingly changed the whole order of scale in small buildings for the worse, and banished for ever that attribute of human proportion which the eye of an artist relishes.

The morning was yet young, and other villages beckoned me on. Hornsey I knew to be devastated by waterworks and railway tracks, Wood Green to be so in name only. Enfield, Southgate, and Barnet were too far afield for my purpose, but in the distant acreage of bricks and mortar I singled out Tottenham, and pursued my way to it through streets intersected with tramlines and electric light standards, and came at last to Scotland Green (see sketch). Tottenham has ever been a great place for antiquaries, a reputation shared with Clapton. This is Charles Lamb's district as much as Mackery End, in Hertford-

Scotland Green, Tottenham, N.

shire. In one of these houses George Eliot stayed. Along this highway John Gilpin galloped past Edmonton to Ware and back again to London. Along this same Ermine-street the Roman legions marched eighteen centuries ago, and for hundreds of years statesmen, scholars, and peasantry journeyed between Cambridge and London. The very brick houses, strung out in isolated solemnity from Stoke Newington to Royston, bear a family likeness and sport the same brick livery. In the front of Scotland Green—appropriate name to the direction of the great road—there stands a building formerly known as the Blue School, where in old times girls were educated without charge. It is now a school for middle-class pupils, and the charges have correspondingly increased. Near by stood the Watch House, the prisoners' cage, and the house of John Fowler, the parish beadle, who was responsible for the custody of unruly human birds. At times the honest guardian found his hands full, and was forced to send to London for an additional constable. Many old cottages are still *in situ* on Scotland Green. They are distinguished by strange names. For example, Ward's-alley, Tubbey's-alley, Stack-yard, etc. At this point the Moselle crosses the High-road and empties into the Carbuncle Ditch, from thence to swell the waters of the Lea, and so to the Thames. The old Blue Coat School, built in 1735, and endowed with £360 in small benefactions, was rebuilt in 1833. Tottenham offered many other attractions to my imagination; there was so much to be seen, so many things to record, but I resolved to devote future leisure to the study. I had not the courage to explore Walthamstow, which even thirty years ago was a pleasant place, and I knew that the old house which once afforded me shelter as a boy, and the wonderful fruit garden, with its interminable walks, ending in a path to the Forest, no longer existed. Yet the call of the open road was upon me, and by devious ways I tramped through Lea Bridge to the Pond at Snaresbrook, and by the mushroom suburb of Ilford to Romford, which was reached just as the light failed; but my journey was not altogether fruitless, for in the London-road I found buildings of the time of Elizabeth standing in neighbourly humour with youngsters which first saw the sun when Queen Anne ruled her mighty dominions. Had the day been longer I should have found time to explore Chigwell and Brentwood, for enthusiasm waxed within me. But stay, to-morrow will dawn, and then who knows what discoveries will be made? Within two hours I was back at Hampstead, which place has always been thought the chief as well as the most salubrious of London's villages.

BOXING DAY.

Hampstead looked the picture of English charm under the spell of December; it has not suffered in the way of other London retreats. It has been enlarged in all directions, but its old streets are still distinctive as they thread their way through a maze of Victorian houses. It is attached to Hendon on the north and to Cricklewood and Kilburn on the west; it does not recognise the encroachments of Kentish Town or the lordly terraces of Regent's Park. Early in the morning I started my investigations, beginning in John-street, now Keats-grove, with a glimpse at the villa where Keats lived before his last journey to Rome. Hereabouts the early nineteenth-century development of Hampstead is evidenced. There are stuccoed villas, with dainty windows and elegant ironwork, trellis verandahs and covered entrance ways. Heath-street and High-street boast many survivals of the Georgian era, both early and late. Church-row and Flitcroft's steeple stand benign. Frognal still savours of quasi-Gothic taste. Near the Flask is the weather-boarded house and studio, built cheaply in the last years of the eighteenth century for Romney, whom competition crowded out of fashionable London. This I thought to be a fit place to explore, and having gained an entrance, examined the hall, ascended the easy geometrical staircase, and, entered the painter's lofty studio between the wide folding doors. This room suggests nothing more than an assembly-room such as one encounters in a country town. There are the same tall sashed windows, the balcony for musicians, approached by a secret stair in a cupboard, and the same atmosphere of desolation. From a door in this room one catches a glimpse of a large apartment beyond. The Spartan simplicity of the room, its gigantic scale, the delicacy of the beaded architraves and cornice, the entire absence of decoration are in accordance with Romney's last years. How I should have liked to hang the walls with the master's pictures, to swing a candelabra from the centre of the ceiling, to press some willing musicians into the gallery, and then to people the room with the costumes and sparkle of the time! This house is appropriate to the purposes of a Romney museum, yet I doubt if the good folk in the neighbouring houses ever give it a thought or take the trouble to pull the bell and gain admittance. The Spaniards Promenade and Jack Straw's Castle were thronged with happy people, much as has been the case for a century. My Lord Mansfield's House, objective of Gordon rioters, stands within its classic grove of trees, and to the north the square stump of Barnet Church sharply punctuates the landscape, but all these delights must be left for another day.

How I should enjoy a walk to Hendon in the tracks of Bill Sikes and his dog, but Golder's Green is a formidable barrier and has little attraction for me! Shall I go on to Harrow, through Cricklewood, and visit the farm between the Finchley and Edgware roads, or shall I betake my steps to Richmond and Hampton Court? Any of these directions hold potential charms, but, halt! I am due to sup with friends at Mortlake this evening, and long tramps are out of the question. I decide for Mortlake, and, taking train to Kew from Hampstead Station, reach the historic gardens just as evening falls. "Mortlake, sir?" said a happy lamplighter whom I encountered outside Kew Station, balancing himself in the gale at the top of a ladder. "The best way to the 'village' is to walk across the meadows to the High-street; it is about twenty minutes away." I took his advice and made my way beneath dangerous elm-trees, and by spacious old mansions standing alone amidst bleak fields, and came unexpectedly upon the Thames in full flood. Earlier in the day I had entertained thoughts of chartering a boat at Kew and approaching my friend's house by water, climbing his garden wall, and entering by way of the lawn. The angry face of the Thames rebuked me, and I was thankful for the safety of the meadow path. Lights gleamed in the distance, barges rocked sullenly at the wharves, the tall chimney of the brewery at the end of the High-street seemed to rock to the gale. It was a fitting entry to the village of the dead lake, a sombre tapestry rivalling those for which this village was famous when William of Orange kept court at Hampton. In Mortlake I chanced upon the true atmosphere of the London village of the eighteenth century. Old-world houses gave friendly shelter to the passenger, flickering lights deeply recessed behind sashed shop-fronts called attention to seasonable wares. The cupola crowning the tower of Mortlake Church peered down on me in friendly recognition. I was nearing a tangible welcome. My architect friend's house at last! I approached through a paved court and gained the entrance hall with the family portraits—Romney's studio again, but this time full of merry people, some in Georgian costume. A real hanging candelabra, with superfine wax wicks sparkling from every sconce; a perfect forest of greenery, holly and mistletoe included, decking picture frames and other vantage-points. Dances, charades, supper in a dining-room one reads about but seldom sees. A sketch in costume without a plot, arranged by two artist friends, giving the interior of Sir Joshua Reynolds's studio in Leicester Fields, on the occasion of a visit to the painter from Sir William Chambers, while the Duchess of Devonshire was sitting. The latter scene realistic and scholarly even to the small talk and scandal in which her Grace joined concerning the importance of keeping the Royal Academy select and the necessity of keeping interlopers outside its mystic gates. Thus the evening passed in congenial society. My host had some soldiers of the London Scottish billeted upon him, and they were the lions of the revels. It was truly the most interesting and delightful experience of my years. Yet it was not until I put these thoughts on paper that I appreciated how much my walks abroad during the previous days had helped me to enjoy the hospitality, and it is now I realise that architecture and the kindred arts subtly influence our existence.

THE STATE AND HOUSING.

A MEETING of the Scottish National Conference on Housing was opened in Glasgow on the 3rd inst. in the hall of the Scottish Co-operative Wholesale Society in Clarence-street, under the auspices of the Glasgow Labour Party Housing Committee, and was attended by 786 delegates representing 362 trade unions, co-operative societies, guilds, and other bodies. Mr. William Gallacher, director of the Scottish Co-operative Wholesale Society, presided.

The Chairman said the war had raised many new issues, but one of the old issues, the housing question, had been raised in a most acute form. Private enterprise had failed, because they provided houses not so much for the people to live in as because investment in houses yielded good dividends. The day of private enterprise was over so far as housing was concerned. Housing had become a great national and civic question. The question of interest was the great bugbear to housing reform. The State must advance money and municipalities must administer it. It must be cheap money—money free of interest altogether—if the housing question in this country was to be solved. If money could be found for the war it must be found for housing.

Dr. A. K. Chalmers, Medical Officer of Health for the city of Glasgow, read a paper on "Housing and Health." He said that one-fifth of the dwellings in the city were one-roomed houses and that 13 per cent. of the population occupied them. Diagrams were shown to illustrate the density of population in the various districts of the city. Incidentally, he remarked that the building of houses one on the top of another was the cause of dear land—the best way to cut down the price of land was to cut down the height of the houses. In every single-apartment house in Glasgow there were more than three people—the number of persons per room was greater the smaller the house was, and that had an effect on the death-rate. In one-roomed houses in Glasgow the male vanished after he reached the age of thirty-five and was found in institutions. It was a fallacy that the one-roomed house was necessary for the old men and old women. The old men did not reside there. What had been found by investigation was what they had not expected to find, and that was the enormous excess of child-life in one-roomed houses. That was one of the reasons why they should consider whether the one-apartment house should not be abolished. Statistics were given to show that the children in one-apartment dwellings were less in height and weight and mental capacity than those reared in larger houses, and Dr. Chalmers characterised the shrinkage represented by the figures as a social injustice. Discussing the question of reform, he said they required an authority that could take a wide view over a large area, such, for instance, as the industrial area of the Clyde. The problem of housing on Clydeside was one affecting the workers not of one town only but in the whole area, which was mutually interdependent.

Councillor John Wheatley read a paper on "The Housing Problem: Other People's Remedies and Ours." He said the alarming development of the housing problem had brought them within reasonable reach of a house famine. In every part of the country they had the same story. Private enterprise had withdrawn for the time being from the building of working-class houses. The present scarcity of houses was primarily due to the growth of combines among manufacturers and merchants of building material. There was no local authority in Scotland that was facing as it ought to do this terrible national problem. To tackle it successfully they must build large numbers of healthy houses, and such a building scheme must not be left in the hands of private enterprise. In the plan of the new Scotland for which they were agitating the smallest house would be one of three apartments and a bathroom. The three and four story dwelling had to go. The scheme of the Glasgow Labour Party was to have houses of the cottage type of three apartments and a bathroom. To pay interest of 3½ per cent. on such a scheme they would require a rent of £19 10s. If they could abolish that 3½ per cent. the rent would be £9 14s. They desired to put forward a scheme that would link up every district in Scotland. The capitalist who would lend money without interest did not exist, but the Government could do it. He explained his scheme of securing from the Government money free of interest with which to erect houses of a yearly rental of £9 14s. A certain number of houses would be erected each year, and at the end of sixty-one years the revenue from rent would be sufficient to carry on the scheme without further grants. A Government grant spread over sixty-one years of £2,500,000 per year would enable them to lay out a new Scotland on a new basis. That was only the cost of the war for half a day.

Mr. R. W. Horne, A.R.I.B.A. (City Engineer's Department), read a paper on "Town Planning and Housing."

Buildings in London-Road, Romford, E.

From a sketch by Mr. J. Fred Wilson. (*See page* 51.)

SHORTAGE OF HOUSES.

The Manchester Tenants' Defence Association proposes to agitate for a remedy for the house famine and to stir up a national agitation, so that the Treasury may be induced to remove the prohibition upon municipal building schemes. The first step will probably be to send a deputation to make representations to the Manchester Sanitary Committee. There is said to be a very considerable shortage of houses in the city. For a few years past speculative building has been on the decline, and the war has almost completely stopped the erection of cottage property. At the same time the Treasury has, for reasons of national economy, put a veto on municipal building, and in the case of Manchester this veto has prevented the carrying out of schemes which the Council had already approved. These municipal projects were not on a scale large enough to provide anything like a remedy for the shortage of houses, but they would have done something, and the leading minds in the Tenants' Defence Association feel the necessity for getting the corporations to begin to tackle the problem, however inadequate their first measures may be. It is represented that, at all events for some years to come, there will be no private enterprise in the building of artisans' houses, and that, as the need for more houses steadily grows, the Corporation must build in the interests of the comfort and health of the community.

The number of new houses built in Manchester in the twelve months ending last October was 410, but 200 of them were in Withington, which is very far from being a working-class district. The average number of the new houses built in the five years 1906 to 1910 was 2,400. Then a decline began. In 1911 the number was 1,578; in 1912 it was 1,072; in 1913, 997; and in 1914, 714. In October last the Sanitary Committee took a census of empty houses rented at 8s. 6d. a week or less, and found 348 in the whole of Manchester, which includes all temporarily vacant pending the arrival of the new tenants. In the districts of Harpurhey, Blackley, Moston, and Cheetham not a single house at 8s. 6d. a week or below was empty.

CIVIC REVIEW NOTES.

Woolwich Housing. Woolwich is in the throes of a house famine. There is, it is said, no single house in the borough or district rented at under £50 to let. People advertise offering premiums to those who find them houses. Small houses can be bought, but the mere purchase does not always give the buyers possession. At the commencement of the war the 13,000 Arsenal workers quickly increased in number, and at least 20,000 to 30,000 workers now want homes close to the Arsenal; while Plumstead, Abbey Wood, Charlton, and Westcombe Park have filled up. A deputation from the Borough Council waited on the Local Government Board in December, 1914, to ask that something should be done, and private enterprise was indisposed to meet what was likely to be a temporary demand. The fluctuations of population have been very marked, depending on the policy of the Government for the time being. In the year preceding the Boer War 15,293 men were employed at the Ordnance works, while during the war a maximum of 27,000 was reached. The establishment was reduced to a minimum of 8,400 in 1908, and Woolwich was almost brought to temporary ruin. Under the large Government scheme 1,200 houses have been built on one estate alone, and large numbers of huts and other premises are also being built; but this has not solved the difficulty, which may have to be met by giving special travelling facilities. One of the problems after the war will be to promote other industries in districts where the population has largely increased because of the special circumstances of war, otherwise the cost of the accommodation provided in the present will prove to be a white elephant.

Warley Town-Planning Scheme. At Oldbury District Council a Report was presented upon the new street by-laws which will be applicable in connection with the Warley Town-Planning scheme. The Surveyor stated that the present by-laws for new streets required a uniform width of 42 ft. Under the town-planning scheme the main arterial thoroughfares would have to be considerably wider than this, and the new by-laws would enforce a width of not less than 60 ft. In the case of new streets, where it was obvious there would never be a large amount of vehicular traffic, a width of 40 ft. would be enforced where buildings came up to the building line, but where buildings were set back 30 ft. from the centre of the road a width of 30 ft. would be allowed for the road, ensuring 60 ft. between the opposite rows of buildings. In certain main arterial thoroughfares the width would be 100 ft. We feel there is room for the disappointment of many who think that the appearance of newly-planned districts will be improved by the adoption of wide roads, as when combined with small buildings they accentuate the impression of poverty of design, and suggest monotony. The question of their hygienic advantages is an entirely separate one.

THE BUILDING TRADE.

THE INCREASE OF RENT AND MORTGAGE INTEREST (WAR RESTRICTIONS) ACT.

SINCE the article which appeared in our issue for December 24 was written the Increase of Rent and Mortgage Interest (War Restrictions) Bill has become law, but in a form so different from the original draft that it may be useful to again consider the provisions now embodied in the Act. The original clause 1, which limited the Bill to certain areas, has been eliminated altogether, and now the Act is of general application, except that there are special provisions relating to Scotland and Ireland.

To ascertain to what houses the Act is to apply reference has now to be made to sect. 2, sub-sect. (2), which has been altered in the passage of the Bill through Parliament. The exemption of houses the rateable value of which exceeds £40 has been deleted, and the Act now applies to any house or part of a house let as a separate dwelling where such letting does not include any land other than the site of the house and a garden or other premises within the curtilage of the dwelling-house, where either the annual amount of the standard rent or the rateable value of the house or part of the house does not exceed (*a*) in the Metropolitan Police district, including the City of London, £35; (*b*) in Scotland, £30; (*c*) elsewhere, £26. A new provision has been added that the Act shall not apply to a dwelling-house let at a rent which includes payments in respect of board, attendance, or use of furniture.

A great point was made of retaining the double test of both standard rent and rateable value, but it is hard to see what object is attained, whilst it makes the Act apply to houses of a higher rental than might at first sight be gathered from the Act. It is hardly possible that in any case the house is let at a rent less than the rateable value, so in fact the Act will operate on the rateable value, and will embrace houses let at from a quarter to a third above the limits mentioned in this sub-section.

Not only are houses thus brought into the Act having a rental in London of about £44 and elsewhere £33, but the original intention of the Bill seems to have been totally lost sight of. In the original Bill, in clause 1 it was stated that, "having regard to conditions arising out of the present war," the Act would be applied in certain areas by Order in Council, and in other areas "where it appears to His Majesty that owing to the influx of population or other circumstances attributable to the present war there is a dearth of housing accommodation," and in a note to our article of December 24 we drew attention to the assurance that we understood had been given in Committee that if the scope of the Act was enlarged, yet it would be limited to cases where there was interference with the housing of the working classes, notably in munition areas. In the Act as passed there is not one word of any such qualification, and the Bill is like a quick-change music-hall artist:—Having entered the House as a Bill necessitated by the urgency of the times to prevent certain classes from being exploited, after a brief absence it has returned as a full-fledged Act, limiting any increase in rents and interests on mortgages all over the country, with a very high rental limit and without any reference to the working classes. When the Bill was introduced, imagining that it was a measure intended to redress certain limited though real grievances the consequence of the war, we, as patriotic citizens, withheld any undue criticism of the measure; but in the form the Act has now taken we can only condemn it as a totally uncalled for and ill-conceived piece of legislation which will bear heavily on a class already very hard hit by the war, and which may relieve many persons who are in no need of relief, but to whom the war has brought a considerable increase of wealth and prosperity. It will further discourage building, and thus accentuate the difficulty of finding housing accommodation, and so increase the difficulties and hardships it purports to deal with.

There is now a provision in the Act enabling the landlord to recoup himself for an increase in the rates, including water rates and charges; but in the provision relating to an allowance not exceeding 6 per cent. on the amount expended on the improvement or structural alteration of any dwelling-house it is now expressly stated that this shall not include expenditure on decoration or repairs. Where any increase in rent is made it shall not be recoverable until the expiry of four clear weeks after a notice served by the landlord upon the tenant.

There is also a new section limiting the power of the landlord to obtain an order for the recovery of possession or for ejectment.

As regards mortgages, the Act is rather more favourable to the mortgagee than the Bill was. There is a provision that the Act shall not apply to any mortgage comprising one or more dwelling-houses to which the Act applies and other land if the rateable value of such houses is less than one-tenth of the whole of the land comprised in the mortgage; and where the rate of interest on a mortgage has been increased in pursuance of a notice given before August 4, 1914, demanding either repayment of the capital or an increased rate of interest, such increase is excluded from the operation of the Act. The section which limits the right of a mortgagee to call in his mortgage has also been modified in favour of the mortgagee, and there is an important provision relating to mortgages of leasehold interests where the mortgagee can show that his security is diminishing seriously in value or is otherwise in jeopardy. It also appears that it is intended not to apply the provisions of the Act preventing mortgages from being called in to mortgages where the principal is repayable by periodical instalments extending over a term of not less than ten years or where the mortgagor consents. We have not attempted a complete summary of all the provisions of the Act, but it will be seen that this is a measure which will most seriously depreciate the very class of property which is most heavily taxed for war purposes, and in its present form we cannot but think that no case whatever has been made out, or even been attempted to be made out, for invidious legislation of this character.

THE PROPERTIES OF LIMES AND PLASTERS.—II.

LIMES as a class, including as this does the chief ingredients of hydraulic mortars and cements, are very important materials, and it will be convenient to subdivide the discussion upon them into those of simple structure—(1) the fat and dolomitic limes which will form the subject of this article, (2) the hydraulic limes, and (3) natural and artificial cements.

All limes, whatever their nature, are prepared from some mineral which is substantially carbonate of lime (calcium carbonate $CaCO_3$), either in the form of limestone, chalk, marble, or occasionally shell fragments. These materials often contain other constituents which modify the properties of the resulting lime in a very marked manner; but when the amount is small—say not more than 5 per cent.—the resulting burnt product comes under the category of ordinary non-hydraulic lime, and if the additional constituent is magnesia the product is known as a dolomitic lime.

When calcium carbonate is heated to redness it decomposes into free lime (calcium oxide) and carbonic acid gas (carbon dioxide) thus :—

$$\underset{\text{Cal.carbonate.}}{CaCO_3} = \underset{\text{Cal. oxide.}}{CaO} + \underset{\text{Carbon dioxide.}}{CO_2}$$

And every 100 parts by weight of cal. carbonate thus decomposed produce fifty-six parts of free lime and forty-four parts of carbonic acid gas. The operation is generally conduct in somewhat primitive fashion by heati the limestone or chalk in kilns which intermittent in working, which represents ve great loss in fuel, as after each operati the kiln itself—a tremendous absorber of heat must be allowed to cool before it can be refill Many forms of continuous kilns exist whi admit of the addition of the stone at the t and its withdrawal below when burnt; b the old-fashioned types still exist very larg in this country, doubtless owing to the absen of mechanism and the simpler labour proble thereby involved. Another great source waste is the total loss of the carbonic a gas—44 tons, or some 600,000 cubic ft. every 100 tons of limestone burnt—whi could be put to useful purposes. So attempts have been made to remedy this was but until lime is made by some intensi process, small quantities being dealt with at hi temperature in a continuous furnace, t waste seems almost inevitable. Free lime h a marked tendency to recombine with carbo acid gas when in contact with it; the m efficient methods of lime-burning, therefo must provide for a rapid removal of the g when liberated. This, of course, ordinar takes place by simple expansion by hea which causes a constant upward current the kiln.

Lime Slaking.

When lime is slaked by the addition water it becomes hydrated lime, and if eighte parts by weight of water are added to fifty-s of free lime (that is water equal to one-thi the weight of the lime approximately), t whole will remain as a dry bulky powd the chemical action being :—

$$\underset{\substack{\text{Free lime}\\ \text{(Cal. oxide).}}}{CaO} + \underset{\text{Water.}}{H_2O} = \underset{\text{Hydrated lime.}}{CaO_2H_2}$$

The actual increase in bulk, which is gre depends upon the purity of the lime and t rapidity of slaking. A pure lime—the be fat lime—suddenly slaked into water w expand to a powder three and a half times original volume; but, if allowed to slowly abso moisture from the air, will eventually increa to little more than one and a half times previous bulk. If impure it will expa much less, and the action will be accompani by but little display of heat. Further additi of water merely converts the hydrate powd into a slurry, or cream, of lime and wate but, as will be seen in a later discussion, li can, under suitable condition, take up wat of crystallisation (see Art. I.) and form a we defined solid with much more water than present in the hydrate as described above.

Fat limes, as these pure limes are calle are used chiefly for running "putty"—th is, they are the material of the plasterer and, though used with sand for mortar, th never attain any appreciable strength, setti merely through mechanical cohesion due simple drying and to the very low absorpti of carbonic acid gas always present in t atmosphere, which gradually reconverts the into limestone, thus :—

$$CaO + CO_2 = CaCO_3.$$

This conversion, however, is never fou completed even in the most ancient buildin It is possible also that the free limes gradual form in some measure the crystallised hydra referred to above, by absorbing water water of crystallisation. Fat lime morta composed of one of lime to two of sand, posses tensile strength of 30 lb. to 50 lb. per square in and even after a year the latter figure is n likely to be exceeded. This strength is, course, trivial.

Dolomitic Limes.

Certain limestones contain a notable p portion of magnesia—of such a character the Mansfield Woodhouse stone, for examp These stones are found in the Permian g logical formation which is exposed on the c

South Shields, and runs in a narrow band he Midland Counties. These stones consist alcium carbonate and magnesium carbonate arying proportions, and when "burnt" give ixture of free lime and magnesia (MgO) :—

$$\left.\begin{matrix}CaCO_3 \\ MgCO_3\end{matrix}\right. = \left.\begin{matrix}CaO \\ MgO\end{matrix}\right\} + 2\,CO_2.$$

agnesium carbonate is much more readily omposed than calcium carbonate, hence se limestones are more readily "burnt." magnesia, further, does not absorb water such great activity, nor expand so much ing the operation. Thus dolomitic limes their behaviour on the addition of water ewhat resemble poor limes—that is, those ch contain a large proportion of inert erials or which are insufficiently burnt. this reason, possibly, they do not appear to very popular; but, although very weak as pared with the hydraulic class of these erials, they are eventually (say, after a) nearly twice as strong as pure fat limes, will carry sand better.

wing to the unskilled labour generally ployed for slaking limes, and the consequent ger of lumps of free lime, which would se eventual disruption in the finished k, limes are often hydrated (dry slaked) water or steam before they are sent out, ch is usually a good investment for the nufacturer. In order to compare prices uick and hydrated lime, the data already tioned may be utilised. If bought by bulk nust be remembered that hydrated lime possibly three times the bulk of free lime owder, and if by weight the water absorbed esents one-third of the weight of its original k lime.

MARCATION DISPUTES AND THEIR SETTLEMENT.

CONFERENCE was held at Koh-i-Noor se, Kingsway, London, W.C., recently, urther consider a national scheme for the blishing of committees to deal with demarca- disputes. It was reported that the follow- unions and associations have definitely roved the rules and intimated readiness ign the agreement :—National Federation of ding Trades Employers of Great Britain Ireland; National Federation of Slate chants, Slaters and Tilers; National ciation of Master Plasterers; National ciation of Master Heating and Domestic ineers; Society of Operative Stonemasons; chester Unity of Operative Bricklayers; eral Union of Operative Carpenters and ers; Amalgamated Society of Carpenters Joiners; National Association of Operative terers; Amalgamated Slaters' and Tilers' ident Society; National Association of ders' Labourers; National Union of rative Heating and Domestic Engineers; vies, Builders' Labourers, and General ourers' Union; United Builders' Labourers' n; Amalgamated Society of Woodcutting hinists; Amalgamated Union of Cabinet ers; Electrical Trades Union; National lgamated Society of Operative House and Painters and Decorators; Operative Brick- s' Society. It was therefore unanimously ved :—"That this meeting of representa- of the federations, associations, and ties which have signified their adhesion to proposed National Demarcation Scheme satisfied that a sufficient number of sions have been secured to warrant the me being proceeded with, the said scheme nd is hereby constituted as from this ." The necessary elections of the com- ees and officers will now be proceeded with, it is expected the scheme will be in working r in the spring; but in order to deal with disputes which may arise meanwhile it was imously agreed :—"That, in view of the that the new organisation cannot be got working order until the first annual meetings he respective committees are held in uary and March, this meeting requests onciliation Boards to place their machinery e service of those concerned in any demarca- dispute which may arise meanwhile, nenting their existing membership tem- rily by the admission of all parties erned in any dispute, and that the parties to such disputes be recommended to avail themselves of those services *pro tem.*"

The scope of the scheme is, briefly, the settlement of all questions or disputes relating to demarcation of work that may from time to time arise between the parties, by reference for adjustment to standing joint committees with a view to an amicable settlement of the same without resorting to strikes or lock-outs. In the event of a demarcation dispute or question between trades represented by the societies who are parties to the agreement arising on or in connection with the works of an employer whose federation is a party to the scheme, there shall be no stoppage of work, either of a partial or general character, but such dispute or question shall be considered and dealt with in accordance with the rules and regulations provided. These follow the lines of the National Conciliation Scheme, which has worked successfully for upwards of ten years, but certain special features have been introduced, taken from what seemed most useful in other existing demarcation schemes. The new scheme will work alongside, but independently, of the Conciliation Scheme.

FIRE-RESISTING WALL BOARDS.

As resistance to fire is a very important point with all wall boards, the experiment on "Fiberlic" and other boards will be of interest. An illustration which we have seen shows three boards. No. 1 is "Fiberlic" root fibre board, Nos. 2 and 3 are ground wood-pulp boards. The test was made by means of a blow-pipe with a 2-in. flame, and the boards were heated for three minutes under this intense flame, the tip of the flame actually touching the boards. The photograph shows the resistance to fire of the "Fiberlic" board—it is only just browned; while the other boards, as can be seen from the photograph, were burned through. It is explained that "Fiberlic" is highly fire-resisting because of the special chemical treatment during manufacture of the tough root fibres; added to this is the great density created by hydraulic pressure. This density also gives the material its sound-deadening qualities and makes it a non-conductor of heat and cold. The board, which is manufactured by Messrs. MacAndrews & Forbes, Ltd., Finsbury-court, Finsbury-pavement, E.C., is, we are informed, making considerable headway in this country, although it has only been on the British market a few months.

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations :—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Ashby Woulds.—The Council's Surveyor has received plans for a house to be built on the east side of the proposed new road opposite to the Railway Inn, Moira.

Bedford.—The R.D.C. has passed plans for a residence at Putnoe for Mr. A. G. Prosser, and one at Kimbolton-road for Mr. R. Atkins.

Birmingham.—The City Council has sanctioned the extension and equipment of the temporary supply station at Nechells, at an estimated cost of £148,660.

Braintree.—Plans passed by the U.D.C. :—For the erection of two pairs of villas by Mr. E. Warren at Chapel-hill, an office and garage at Manor Works, and a mess-room for Messrs. Lake & Elliot's workmen, and plans for a verandah at the Oak Inn, Chapel Hill.

Bristol.—The Docks Committee has granted permission to the G.W.R. Company to erect two sawdust huts at Portishead Dock. On the question of alternative sites proposed for the erection of the barge loading and intake plant on the east side of the Royal Edward Dock, the Committee has authorised the engineer to proceed with the work on the site between Sheds O. and P., and to accept tenders for the various portions of the work.

Bromley.—The L.G.B. has sanctioned the raising by the West Kent Main Drainage Board of £700 for the construction of a jetty at the outfall works.

Buckie.—The P.C. has approved of the scheme for an extension of the Rathven Parish Hospital.

Cannock.—Messrs. Macfarlane & Robinson are developing some land in connection with their new works at Bushbury for erecting houses, &c., and propose to make some new streets, which they will ask the Council to take over.

Chorley.—The T.C. has approved plans prepared by Messrs. Woodhouse & Howard of the proposed public baths, and are making application to the L.G.B. for a provisional sanction to the borrowing of £10,000, being the estimated amount required for the provision of the baths.

Crayford.—Amongst the improvements to be undertaken in Crayford in the future will be the erection of a large hostel near the works, to accommodate the single men employed by Messrs. Vickers.

Dalton.—The U.D.C. has approved a plan of sanitary additions to the Railway Inn, Askam, for Messrs. J. Thompson & Co., Ltd., of Barrow.

Dundee.—Plans and sections of proposed new buildings, etc., have been passed by the T.C. as follows :—Hilltown, cinematograph theatre for Mr. R. Pennycook; King-street, balcony for trustees of Home for Incurables.

Edinburgh.—At a meeting of the Ladies' Committee of the Scottish Veterans' Garden City Association it was reported that a meeting of representatives of all the committees in Scotland would shortly be held to fix the site of the first building scheme.

Edmonton.—Permission has been granted to the Great Eastern Railway Company by the Metropolitan Water Board to construct a railway siding at Angel-road, Edmonton, and to carry it over Pymme's Brook and across the Accommodation-road, giving access to the Board's intercepting drain by means of a level crossing.

Essex.—The C.C. has decided to carry out certain widenings required on the military road now in course of construction between Stanstead and Haverhill, at a cost of £214, the widening on the road from Thaxted to Stamford, at a cost of £65, and a further widening of the same road at a cost of £93 10s. 6d., also to widen the corner at the junctions of the roads leading from Dunmow to Elsenham station and from Braxted to Stansted, at an approximate cost of £50.

Flax Bourton (Somerset).—At a recent meeting of the Somerset C.C. the Mental Deficiency Act Committee reported that they had before them plans of the proposed alterations and additions to the school buildings at the Long Ashton Union Workhouse at Flax Bourton. They resolved that the plans should be submitted to the Board of Control, and it was decided not to put the work in hand until peace had been declared.

Folkestone.—The Kent C.C. have decided to make a new piece of road at Capel, halfway between Folkestone and Dover, to replace that which was damaged by the recent landslip in the Folkestone Warren.

Fowey.—The T.C. has resolved to ask the L.G.B. to hold an inquiry in connection with the proposal to expend £300 on the extension of the cemetery.

London.—The justices have sanctioned the variation of approved plans of alterations to the Crown and Grapes, Little Newport-street, W.C. Plans have been passed for certain alterations to be carried out in the King William the Fourth, 110, Grosvenor-road, and the King's Head, 176, Warwick-street, W. Plans have been approved for alterations or additions at the Lamb, Milton-road, Plaistow (licensee Isaac Harvey), and the Town of Ayr, 6, Victoria Dock-road (licensee, Edward W. Rice).

North Bromsgrove.—The Rubery town-planning scheme promoted by the North Bromsgrove U.D.C. has received the final approval of the L.G.B. The area for which the scheme has been adopted contains approximately 544 acres, and comprises the hamlets of Rubery, the Whetty, and the Eachway.

Ormskirk.—Some members of the D.C. have been appointed to interview the agent to Lord Derby with a view to the purchase of land off Aughton-street for the proposed workmen's dwellings. It is intended to erect on this site, if it is procured, between fifty and sixty cottages when the necessary powers can be obtained from the L.G.B. for the purpose.

Ponders End.—The Metropolitan Water Board has granted permission to the Rees Roturbo Manufacturing Company, Ltd., to construct a siding over the Board's intercepting drain and freehold land immediately south of Ponders End Station.

Retford.—At a recent meeting of the T.C. the architect produced plans for an alternative scheme for an isolation hospital, and the same were considered and ordered to be submitted to the L.G.B. for approval.

Sheffield.—The Corporation has decided to erect 261 houses, at a cost of £75,000, on their Wincobank estate, for the accommodation of munition workers. The City Council propose to close Adsetts-place for the extension of works.

Spain.—The *Gaceta* of December 24 notifies that tenders will be received, within a period of thirty days from that date, at the "Casa Consistorial," Valencia, for the termination of hospital construction works in that city. The

Wolverhampton	9½	9½	9½	10	8	10	8	6½	6½	6½
Worcester	8½	9	9	9	9	9	7½	6	6	6
York	9¾	9¾	9	9½	9½	9	8½	7	7	7

The masons' rate given is for bankers; fixers usually ½d. per hour extra.

estimated cost of the works is 67,657 pesetas (about £2,700).

Stafford.—The B.G. have obtained sanction to the erection of the Cottage Homes, at a cost of £2,500.

Sunderland.—The R.D.C. have made an arrangement with Messrs. Barclay & Co. for the borrowing of £7,000, which the L.G.B. had sanctioned the Council borrowing for the purpose of repairing the sea wall at Whitburn.

Tilbury.—Arrangements are proposed for town-planning the whole district.

Wyken.—The Foleshill R.D.C. has approved plans for 600 houses to be erected in the parish of Wyken by the Coventry Corporation for munition workers.

TRADE NEWS.

Boyle's Latest Patent "Air-Pump" Ventilators have been applied to the new engine house, Dunroyd Mills, Guiseley.

The New Sanatorium, Inverness, is being supplied with Shorland's warm-air ventilating patent Manchester stoves and Manchester grates, by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

In order to prevent water percolating through the cement work of the Propagation Pits in the Botanical Gardens, at Gasnevin (Dublin), the powder Pudlo has been employed with satisfactory results.

A DECEASED BUILDER'S ESTATE.

The late Mr. Charles Bean King, of Frognal, Hampstead, head of the firm of C. B. King, Ltd., has left estate to the gross value of £32,433.

DESK CALENDAR PAD.

Messrs. Stephens & Carter, Ltd., Green-street, Paddington-green, W., have sent us one o their very useful Desk Calendar Pads for 1916; and they inform us that they will be pleased to forward a similar pád to anybody in the Trade applying for one.

A NEW CALENDAR.

Messrs. Robert Boyle & Co., of 64, Holborn-viaduct, have sent us one of their useful littl calendars, in a case for the waistcoat-pocket, fo the year, with which are combined architectura scales, which many architects and surveyor will find useful.

CLARIDGE'S ASPHALTE COMPANY.

We are informed of the resignation of Mr R. T. Wilkinson of his position as a directo of Claridge's Patent Asphalte Company, Ltd. thus severing a connection which he has maintained unbroken for sixty-three years. Th good wishes of all his friends will go with hin in his well-earned retirement. The new directo of this company is Mr. W. J. Robinson, who up to a few years ago, was connected with th timber trade, and may be known to some of ou readers.

◆

NEW COMPANIES.

THE undermentioned particulars of ne companies recently registered are taken fron the Daily Register compiled by Messrs. Jorda & Sons, Ltd., Company Registration Agent Chancery-lane, W.C.

PIPER & CO. (BUILDERS), LTD. (142,558 6, New-street, Huddersfield. Registerec December 29. THE ARCHITECTURAL ASSOCIATION AND THE ROYAL ARCHITECTURAL MUSEUM:

CHANGE OF PREMISES.

The following statement, signed by the President of the Architectural Association, has been issued to members of the Association:—

"For some years past the question of premises has been prominently before the Council, owing to the increasing activities of the Association and the growth of the School. The present accommodation is neither adequate nor suitable in normal times, and with a view to a change in the near future the Council acquired the leases of Nos. 35, 37, and 39, Great Smith-street as a preliminary step. This was done with the concurrence of the Advisory Council of the Association, with whom all important matters affecting the welfare of the Association are discussed.

The outbreak of war last year compelled the Council to postpone any further steps towards the acquisition of new premises or the enlargement of the existing building, and the matter has been in abeyance until recently, when an offer was made for the premises in Tufton-street by the National Lending Library for the Blind.

The Council, feeling that this offer was too important to be allowed to pass, consulted the Advisory Council, put the whole matter before them, and informed them fully of the policy pursued in the past and the aims of the Association for the future. The result of the conference was that the Council accepted the offer made by the National Lending Library for the Blind, and has made arrangements for the Association to occupy No. 37, Great Smith-street as temporary premises until the conclusion of the war.

The change of premises will not interfere with the activities of the Association, and the School will be carried on as heretofore.

The question then came before the Council of the best method of dealing with the contents of the Royal Architectural Museum, which occupies nearly one-half of the available space in the building. It has long been a matter of regret that the housing of this very valuable collection of casts has left so much to be desired in the way of suitable space and good lighting, notwithstanding the fact that the Association has spent some hundreds of pounds on its rearrangement and classification.

In recent years the number of visitors has been so small that the cost of the upkeep, which falls on the Association, has not been justified. The Council has therefore come to the conclusion, with the concurrence of the Trustees of the Association, that the wishes of the early promoters of the Museum could best be met by offering the casts to the Royal Victoria and Albert Museum, retaining a few that are necessary for the School. The offer has been accepted, and the casts are now the property of the nation, and the authorities have promised that every facility will be given to students who desire access to them.

These changes have doubtless been made in the best interests of the Association, and after the most careful thought has been given to the matter. The most important result of the change is a very large annual saving in rent and other standing charges, which will go far to meet the heavy losses sustained by the Association owing to the war.

It is hoped that the action of the Council will meet with the approval of all members of the Association. With this end in view, a special general meeting was held on Monday, when fuller details of the matters referred to in this letter were put before the members."

BOOKS RECEIVED.

L.C.C. Regulations relating to Reinforced Concrete, with Explanatory Notes. By Ewart S. Andrews. (London: B. T. Batsford, Ltd. 2s. 6d. net.)

Bridge Foundations. By W. Burnside. (London: Scott, Greenwood, & Son. 4s. net.)

OBITUARY.

Mr. J. Sutcliffe.

Mr. John Sutcliffe, architect, of Todmorden and Hebden Bridge, died at Harrogate recently, aged seventy years. He was the designer of many of the chapels and schools and the better-class houses in the Calder Valley.

Second-Lieut. A. S. Baxter.

Second-Lieut. Arthur S. Baxter, 18th Middlesex Regiment (Pioneers), died on January 2, at the Empire Hospital, Vincent-square, S.W., of wounds received at Givenchy on December 8. He was the second son of Mr. George Baxter, of Morella-road, Wandsworth-common. He enlisted in the Seaforth Highlanders in September, 1914. He was a Professional Associate of the Surveyors' Institution, and had passed the Fellowship examination; when he joined the forces he was engaged on the land valuer's staff.

Mr. H. Hems.

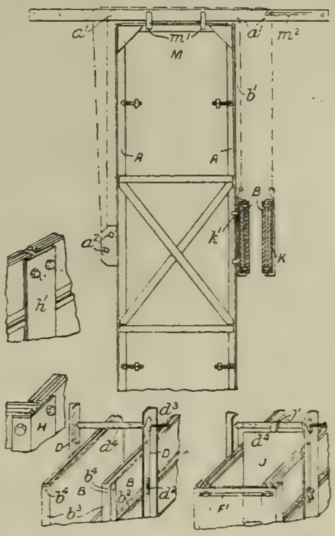
The death is announced of Mr. Harry Hems, aged seventy-four years, head of the firm of Messrs. Harry Hems & Sons (Mr. H. Turner Hems and Mr. Wilfrid P. W. Hems), of Exeter. Mr. Hems began life as a cutler in Sheffield; he was then apprenticed to a wood-carver; he visited Italy, and removed from London to Exeter about forty-five years ago. In 1901 he brought out "A Tramp over Mont Cenis Thirty-seven Years Ago." Mr. Hems carried out many designs by Sir Aston Webb, Messrs. Tully & Clark, of St. Louis, U.S.A.; Mr. Hague, of Dublin; Mr. C. E. Deacon, of Liverpool; Mr. E. Sedding; Mr. Doran Webb; Mr. C. Foster Hayward; Mr. Wm. White; Mr. W. H. Nash; Mr. C. E. Ponting; Mr. F. W. Stevens, of Bombay; Mr. G. H. Fellowes Prynne; Mr. J. Oldrid Scott; Sir G. G. Scott; Mr. J. C. Traylen; Mr. J. P. Seddon; and other eminent architects. His chief ecclesiastical works comprise the carving and sculpture, in Cluney and Mansfield Woodhouse stone, for the restoration of the high altar screen, St. Albans Cathedral (October 29, 1887 *); stalls, throne, and carving, St. John's Cathedral, Newfoundland; reredos and high altar, 35 ft. in height, of Caen stone, Christchurch Cathedral, St. Louis, U.S.A. (1912); and the pulpit, Norwich Cathedral (September 5, 1891 *). Deceased also carried out a large amount of ecclesiastical and memorial work all over the country, especially in the West Country.

◆

SELECTED PATENTS.

15,910 of 1914.—Thomas William Bailey: Moulding walls *in situ.*

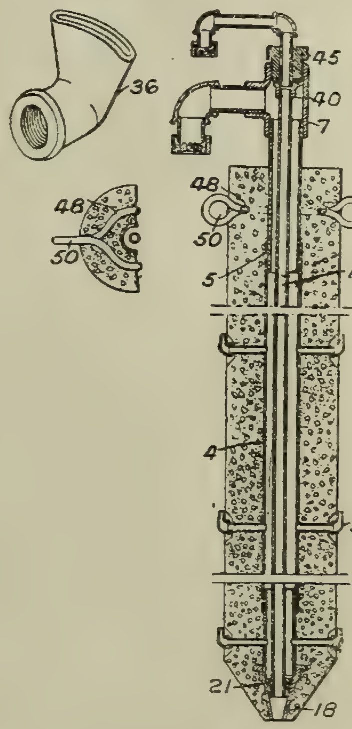
This relates to a method of moulding walls *in situ*, in which the mould boxes or boards B are supported by frames A in such a manner that they can be moved both vertically and longitudinally. The boards are supported by holders K in which they can slide longitudinally, the holders being furnished with clips k^1 embracing T-shaped portions of the frames A. The holders are supported by cables b^1 passing over pulleys a^1 on cantilevers M and over winding-drums a^2. Instead of the holders K, the cables b^1 may be secured to shanks slidably engaging slots in the upper edges of the boards. The ends of the boards are provided with metal plates b^3 furnished with tapped holes b^1 for securing an end plate F^1, an angle connection H, or a plate h^1, for securing two boards end to end. The mould-boards may be spaced apart by angle-irons D, secured by bolts passing through slots d^2 and the slots b^2 and connected by bolts d^3 and sleeves d^4. Partitions J may be suspended from the sleeves d^4 by hooks j^1. One set of pulleys a^1 is adjustable in slots m^2, according to the spacing of the mould-bands. The cantilevers M may be detachably secured by clips m^1, so that the height of the sections A can be increased, and their inner ends may be furnished with a pulley whereby materials may be elevated. Blocks of wood may be positioned within the moulds to form flues or to remain within the wall for the attachment of the skirting or picture rail.



15,910 of 1914.

17,888 of 1914.—Edward Bignell: Sinking caissons, piles, etc.

This relates to piles, caissons, and similar bodies having an excavating nozzle at the lower end and lateral upturned nozzles at the sides with separate water supply to the excavating and upturned nozzles respectively. The pipe 12 for supplying the excavating nozzle 18 is provided at its lower end with a tapered plug 21, which is forced into the tapered interior of the nozzle 18 by a screwed gland 45, which bears on a collar 40 on the pipe 12. The pipe 4 for supplying the lateral nozzles comprises two tubular end sections 5 and a sheet-metal middle section, the lower end section being screwed into the nozzle 18, and the upper end section engaging a supply fitting 7, into which is screwed the gland 45. The side nozzles 36 are of flattened flaring form. A collar 48 provided with projecting eyes 50 is embedded in the concrete of the upper part of the pile, and enables the pile to be attached by a chain to a suitable hoist.



17,888 of 1914.

THE BUILDER

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

VOL. CX.—No. 3807. JANUARY 21, 1916.

THE MONUMENTS OF OUR PROVINCIAL TOWNS:

I.—LIVERPOOL.

THERE cannot be the slightest doubt that a magnificent pile of buildings, like a man with a great personality, is always a dominating factor. Not only is this felt in the immediate surroundings, but in the case of a building it sets, as it were, the keynote for the architecture of a whole city.

Elmes's masterpiece has precisely this effect in Liverpool. Whatever sculpture or architecture appears in the streets must be able to bear comparison with that noble pile or it will be unworthy of its position. St. George's Hall has Greek purity and scholarly refinement. It shows originality both in the massing and the detail, besides having attained a largeness of scale for which it is justly praised. Such a work, forming as it does an architectural tradition, is possibly the reason why Liverpool has many more monuments, and that they show, upon the whole, finer design than is the case in the majority of our provincial towns.

The oldest group—an equestrian statue of George III.—dates from 1810; the latest is either the Florence Nightingale, erected in 1911, or the Sir Lewis Jones, which is undated. Between the dates of these two are about twenty other groups, giving examples of the work during the whole of last century and of the first ten years of the present one, which vary greatly in merit, and unfortunately cannot be said to show a record of continual improvement. This is particularly pronounced with regard to the architectural portion and in the conception of the general scheme. The monuments are placed in various parts of the city, many of them in isolated positions; a considerable number are, however, in the immediate vicinity of St. George's Hall, either in St. John's Gardens, which are behind, or on the St. George's Plateau, which is in front.

The first to claim attention, because by period and scale it maintains the standard of the central building, is the columnar design commemorating the victories of the Duke of Wellington. This stands at one end of St. George's Plateau. Its position makes it appear to some extent disconnected, and a careful study of the site prompts the somewhat dangerous suggestion that two columnar monuments might, in this instance, have been a success, one being placed at either end, marking the boundary of the lay-out. The companion could have been erected to the memory of Nelson. Such a scheme may find a precedent in the dual obelisks of the Egyptian temple front.

But to return from possibilities to facts. The column which exists has many good points. The proportion of the shaft and the scale of the figure both seem to be satisfactory. The Doric Order is adopted, and its sturdy outline gives it a great advantage over the more slender Corinthian of the Nelson Column, which is so frequently condemned by the Londoner. The base consists of a square die ornamented with a bas-relief on each of three faces and the inscription on the fourth. Its broad simple surfaces maintain the strength of the rest of the scheme, and its connection with the column is managed with an ease and straightforwardness which are admirable. The pedestal upon which the figure stands, from the abacus upwards, is perhaps the only weak point.

Coming from this group to the statues which adorn the space in front of the Hall, a great difference is felt in the quality of work displayed. Unconsciously it is realised that there is a vast gap between highly-accomplished architecture and mediocre sculpture.

Three statues are placed in front of the building at this point—one to Queen Victoria and one to the Prince Consort, both equestrian groups, and a standing figure to Earl Beaconsfield. The two first were designed by Thomas Thorneycroft—Queen Victoria in 1869 and the Prince Consort in 1866. Both are stiff in modelling, and show the lack of life and bald commonplace handling which was only too common among nineteenth-century sculptors. The monument to Queen Victoria is the better of the two. It unmistakably shows, however, the difficulty experienced in portraying modern dress in sculpture. The riding-habit, from the near side, is uncomfortable enough, but from the far side, showing as a shapeless mass of bronze below the underside of the horse, it looks clumsy in the extreme. The figures of both monuments are in bronze and the pedestals in grey granite.

Disraeli, Earl of Beaconsfield, was modelled by C. B. Birch, A.R.A., in 1883, and is not above the level of its companions. The pedestal, in this case in red granite, illustrates a tendency which seems to exist in the minds of English artists to make the material of a new group different from that used in existing ones. In order to weld the three into a homogeneous composition it would have seemed natural to use grey granite and bronze in each case.

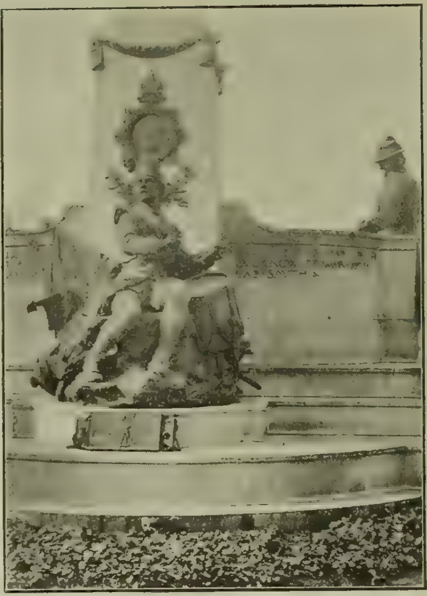
All three statues, by comparison with the architecture behind, seem small in conception and weak in execution. They occupy a position which in all probability might have been chosen by Elmes as a suitable place for sculpture, and it seems a pity that so fine a site should not have more worthy groups to adorn the forecourt of his building. The lions which occur in front of these groups are better than the monuments, but as purely decorative sculpture they do not come under the heading of the present article.

At the back of the Hall a scheme of public gardens, now adorned with a number of statues, was laid out in 1904. The grouping of statuary in open spaces of this sort, surrounded by floral lay-outs, green trees, bushes, and lawns, is most praiseworthy. The sculpture gains an ideal element by its association with the works and productions of nature which it could obtain from nothing else. Each group has an interest of its own, and, although many statues may be placed in close juxtaposition if the ground is judiciously planted, they do not appear as a crowd of men elevated upon posts, which is sometimes the case when a large number of monuments are placed in a public square devoid of all verdure.

The most striking feature noticed upon entering St. John's Gardens is the type of architecture adopted in the design. Ordinarily it would have been taken for granted that the whole scheme should follow the lines of the adjacent structure and a Greek garden lay-out or at least Classic detail be adopted. But here is found the freest of free renderings of so-called English Renaissance, with a long bird-nosed ogee moulding very much in evidence. Nothing could have been more out of keeping or more foreign to the older work, and that such a thing should have been allowed shows again the need of artistic censorship.

The centre of the garden is occupied by two groups placed one in front of the other. This system of placing has the

Wellington Monument.



The Back of the Monument to the Liverpool Regiment.

Detail from the Queen Victoria Monument.

unfortunate result of putting the two in competition and detracting from both. Instead of this, one large dominating group, or two groups placed in sympathetic positions, should have been employed. In the illustration the monument to the Liverpool Regiment is seen in the foreground. The figure on the Gladstone Monument can be discerned in the distance.

The Liverpool Regiment group, the work of Sir William Goscombe John, has several original features and also some excellent detail. The trophy, consisting of a standard, palm-leaf, helmet, and accoutrements, is a very clever piece of modelling of a difficult subject, and is only equalled by the drummer-boy behind. This drummer-boy is a truly brilliant piece of work, showing vigour and realistic representation, coupled with a fine decorative feeling which is only too rare in English sculpture. While, however, in detail such fine features exist, the composition as a whole seems to lack cohesion, and the bronze-work to be applied to the stone in various positions without any sufficient and reasonable connection. The figure of Victory proclaiming peace is hardly up to the high level of the rest of the design.

This difference between the standard attained by the detail of the sculpture and that of the design of the group as a whole is constantly seen. Time after time such a discrepancy occurs, and suggests that if an architect were called in first to prepare a scheme, or were commissioned to work with the sculptor, many English monuments would become works of art worthy of the highest rank among contemporary productions.

The Gladstone Memorial, by Sir Thomas Brock, also shows some good modelling. It is a type of group found fairly frequently, and in the disposition of its parts is based upon the triangle. In the centre and upon the top is a standing figure of Mr. Gladstone in bronze; below, on either side, are two seated figures, also in bronze. The three together form the key of the composition. Some of the architectural detail in this group seems a little heavy, and there are rather too many mouldings of a somewhat ordinary type, but otherwise the group reflects credit both upon its designer and its position.

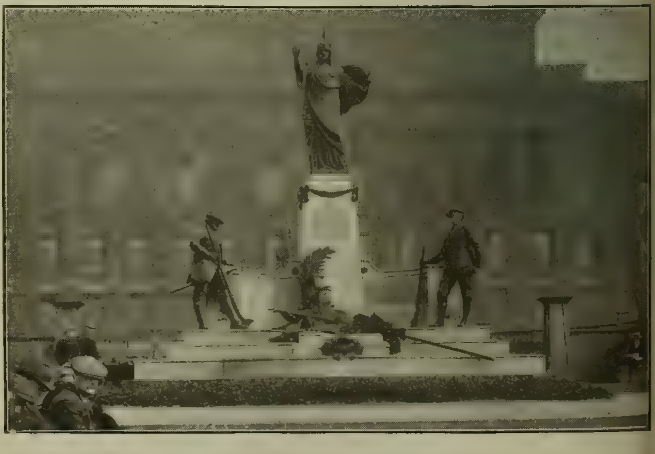
Of the remainder of the statues here two immediately behind St. George's Hall are both by Sir George Frampton. One commemorates William Rathbone, and was erected in 1899, and the other, the Right Hon. Sir Arthur Bower Forwood, erected in 1903. Both were public men connected with the City and had a local reputation which well justifies their commemoration.

The William Rathbone is by far the finer statue. Probably by virtue of his connection with the University, he is portrayed in Doctor's robes, and these have enabled the figure to receive a breadth of treatment, strength of outline and modelling which raise it well above the ordinary level.

As was noticed in the case of the monument to the Liverpool Regiment, the architecture is much below the standard of the sculpture, and it is a matter of wonder that the type of weak, insignificant moulding found in the garden walls is adopted in preference to the fine breadth and pureness of outline of the building behind. Sir Arthur Bower Forwood is portrayed in the conventional frock-coat, and, probably on account of the difficulty invariably experienced when it is employed, the group only achieves a moderate level of interest. It is somewhat strange, however, that, although the two groups occupy symmetrical positions, not only should the detail of the two pedestals vary, but that one should have been executed in what is apparently white Portland stone and the other either in brown Portland or a fine-grained brown sandstone. At any rate, the colour of one is the familiar green-stained white of the Portland pedestal under a bronze figure, the colour of the other a nondescript pale brown.

Besides those already mentioned, there are in St. John's Gardens monuments to Monseignor James Nugent, by F. W. Pomeroy, erected in 1905; to Alexander Balfour, by A. Bruce Joy, erected in 1889; and to T. Mayor Lester, by Sir George Frampton, erected in 1907. None of these call for special mention. They are standing bronze figures upon stone or granite bases. That to Monseignor Nugent is perhaps the most interesting.

Before leaving this group of monuments mention may be made of the fact, which is perhaps purely coincidence, that nearly all possess long inscriptions or several panels containing words and phrases which, added together, amount to the same thing. Unless there is some special reason for their inclusion



Monument to the Liverpool Regiment.

in the design, many of these wordy epistles do nothing to add to the interest of the monument, rather do they detract, since, if it is necessary to excuse the existence of the statue by a list of the man's claims to immortality, it were better not erected, The difficulty frequently is that the subscribers to the fund or the personal donor, as the case may be, have an intimate acquaintance with the subject. These words or sentences convey to them definite meaning and awaken memories of the worker whose voice has become still for ever. But the statue is viewed by thousands who have never known the individual alive and to whom the sculpture must be left to conjure up a picture. If it is sufficiently vivid a portrayal, not alone of his features but of his personality, his name, the dates of birth, death, and of the erection of the statue, with perhaps a statement of the field in which the man's work lay, should be all that is required. One instance of these long inscriptions may be quoted from the monument of Monseignor Nugent. There are four faces.

On the first face :—

Monseignor James Nugent, 1822–1905.
Save the boy.

On the second face :—

Erected by public subscription.
Unveiled 8th December, 1906.

On the third face :—

His words :—
"Speak a kind word.
Take them gently by the hand.
Work is the best reforming and elevating power.
Loyalty to Country and to God."

On the fourth face :—

An eye to the blind, a foot to the lame.
Father to the Poor.
The Apostle of Temperance.
The Protector of the Orphan Child.
The Consoler of the Prisoner.
The Reformer of the Criminal.
The Saviour of Fallen Womanhood.
The Friend to all in Poverty and Affliction.

Much of this is quite pointless without supplementary knowledge.

[*To be continued in our next issue.*—ED.]

◆

NOTES.

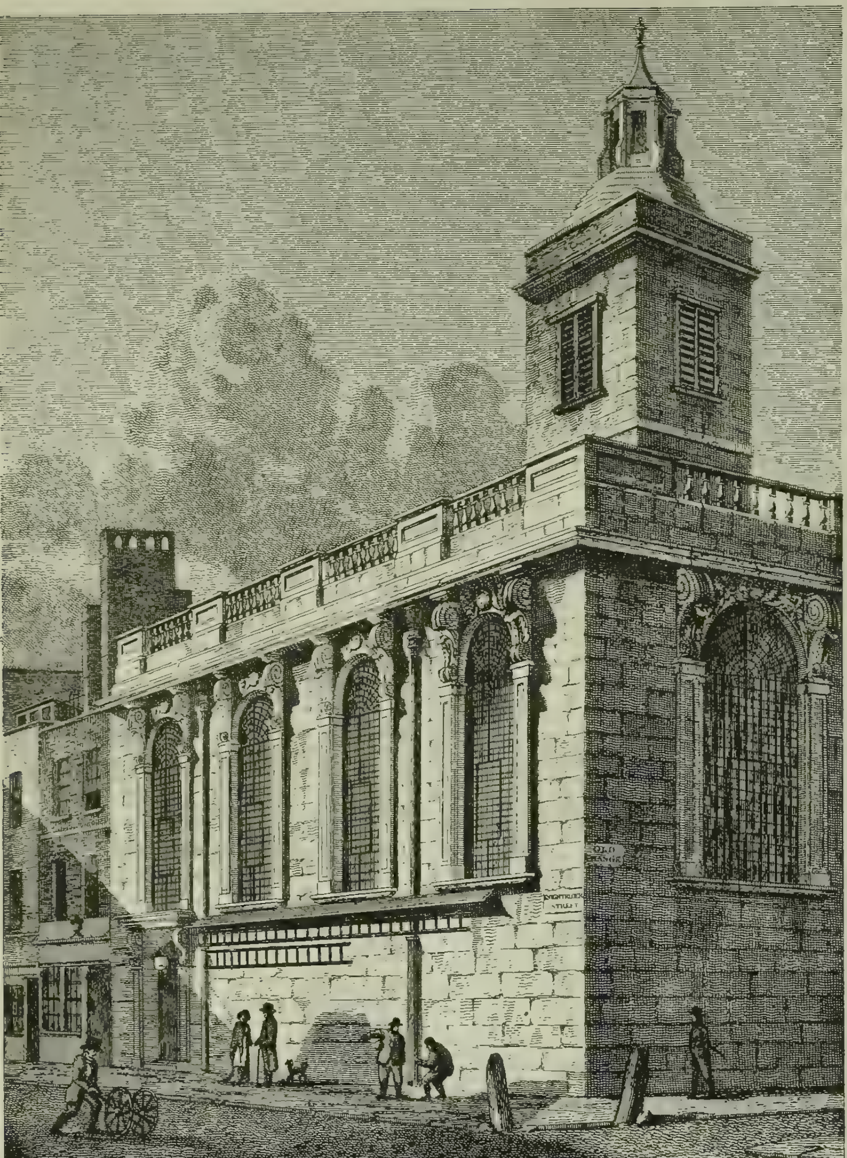
The Possibilities of Peace. IN the normal times of peace, when any great improvement in our towns of social life is suggested we usually hear the comment "We can't afford it," and we see the best things relegated to the region of the impossible. Yet we have been at war for nearly eighteen months, and in that time have spent daily in war an amount which would have sufficed to pay for St. Paul's Cathedral twice over. Had it ever been suggested to us that we should spend five million pounds in one week in improvements of our towns, in afforestation, or the provision of new roads and commercial waterways, we should have said that anyone who had suggested it was an impossible idealistic crank. Yet we know by actual experience that, given necessity, we can do what was previously considered impossible; and it were well that we should remember it when peace comes once more. We have been told by reformers that the expenditure in preparation for war was a waste of the national resources; yet that expense, if it obviated war, would be a drop in the bucket compared with the cost of war itself, and so the cost of preparation to combat the evils of civilised life, ill-health, ignorance, and the waste of effort —and we may add the consequent want of happiness of a large part of the population—may prove infinitely small in proportion to the advantages to be gained by a policy of wide liberality. Only to those who are utterly without imagination will the evils of modern life appear inevitable after the awakening of war.

War and Economy. THE St. Pancras Guardians have, we learn, decided on the following economies :—(1) Single instead of double sheets of notepaper; (2) firebricks in open grates; (3) coal mixed with coke; (4) to chop their own firewood; (5) medium-weight cloaks for nurses, to serve for summer and winter alike. As to the last, we presume the Guardians are satisfied that the interests of economy are really served by nurses having clothes which are not warm enough in winter and too warm in summer, for that seems to be the inner meaning of the economy. With regard to the half-sheets of notepaper, we imagine no one will be worse off, though autograph-hunters will find the cherished signatures spread over a smaller space; however, the literary style of the writers may be improved by greater terseness and brevity. The firing economies are more to the point, but all the little items recorded are at once eloquent of the real desire to save and examples of the difficulty of the process.

Professional Organisation. A SERIES of lectures on Professional Organisation, to be given by Mrs. Sydney Webb at the London School of Economics, should be of unusual interest at the present moment. On all sides we hear of our lack of national organisation. This defect is apparent, we are told, in our Government, our commerce, and our science, and now it seems to be inferred that it is present also in our professions. Mrs. Webb will deal, in turn, with such professions as Medicine, Teaching, Engineering, Accountancy, and Architecture. Whatever may be the case of other professions, there is little doubt that architecture, whether regarded as an art or as a profession, has a good deal to gain by better organisation, and we shall be interested to hear what so great an authority as Mrs. Sydney Webb has to say on the subject. If it is true that we all have to put our houses in order if we wish to hold our own after the war, the sooner we begin the better. We are all for concentrating national energy on winning the war; but those of us who are prevented, possibly by this very lack of national organisation, from using the whole of our energies in this direction might well devote what surplus remains to this important question. The Selection Committee of the Architects' War Committee appear to have made a start in the right direction with their analysis of the special qualifications of members of the profession, and we hope that the idea will not be altogether abandoned when the war is over.

Wren's Mistake. WE learn from an evening paper, if the information be correct, that the instability of the dome of St. Paul's, which is causing the Cathedral authorities trouble, is mainly the result of a change of plan which was not carried far enough. The original design—by which we presume the Warrant design is meant—provided for a smaller and lighter dome; but when the present massive dome was substituted Wren decided that the piers designed for the "discarded" dome were strong enough for the heavier one, and made no alteration in the "foundations." The Portland stone piers, instead of being solid, are hollow and filled with rubble, hence the subsequent trouble. We think fact and fiction are about equally mixed in the statements we repeat. Wren may have intended a lighter dome or not if he had wanted to carry out the steeple surmounting the shallow dome shown in the Warrant design. We imagine his skill as a constructor would have been more exercised than it was by the problem he actually solved, since the weight of the enormous centre feature would have greatly exceeded that of the present lantern; nor is there room in the design for the core of brickwork which carries the lantern. It is likely that Wren's task may have been made more difficult by architectural improvements he made in execution, which added to the weight to be carried; but the main point is that a dome, if not constructed on the principle of horizontal courses succeeding one another without weight at the apex of the curve, must always be in a state of greater or less unstable equilibrium, and the material resources of the time did not permit of those expedients which are in the hands of the builders of to-day. Most great buildings look the embodiment of eternity, while they are the battleground of opposing forces, the action of which is always tending towards destruction.

The Pastel Society. THERE is a great deal of good and interesting work at the Pastel Society's Exhibition now being held in the Galleries of the Royal Institute of Painters. Mr. Herbert Draper's two portraits—No. 11, "Betty," and No. 13, "Yvonne"—are good. Mr. Lewis Baumer sends four dainty and spirited drawings entitled "The Blue Dress," "Pierrot," "The Pink Dress," and "Columbine" (Nos. 22-25). "L'Institut de France—Night" (No. 36) is a clever impressionistic study by Mr. Terrick Williams, R.O.I. Mr. Arthur Wardle's studies of animals, Nos. 55-60, are masterly in their vigorous expression of life. Mr. S. Melton Fisher sends a charming study in No. 63, "A Sleeping Girl," which is one of the best things in the Exhibition. We like Mr. J. Barnard Davis's work, Nos. 87-90, consisting of country subjects in Buckinghamshire, and showing much refinement and sense of colour. No. 100, "Crossing the Dunes," by Miss Maude Harris, is a powerful study of two Dutch women, portrayed with much realism. Mr. Thos. F. M. Sheard, R.B.A., sends three interesting studies from Arab cities in the desert. Mrs. Burn-Murdoch's "Foxgloves" (No. 124) gives a pleasing effect of colour. Mr. Bernard Partridge sends two admirable figure sketches entitled "Studio Studies" (Nos. 155 and 156). Mr. Wynford Dewhurst sends a series of his characteristic work in landscape, Nos. 184-189. Mr. P. Harland Fisher's two portraits, No. 200 ("Major G. T. Kelly") and No. 201 ("Mrs. George Kelly"), are excellent. Miss Sarah Challice Constable's landscape studies are very pleasing, especially No. 229 ("On the River at Wareham"), No. 231 ("A Pool on a Dorsetshire Common"), and No. 232 ("Corfe Castle"), and we like Mr. Edward H. Chetwood-Aiken's "Afterglow—Holland" (No. 246). The general level of the Exhibition is a high one.



St. Mary Magdalen, Knightrider-Street.

From an engraving by J. Booth, 1812.

THE LONDON CHURCHES OF WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

No. IV.—St. Martin, Ludgate-Hill.

St. Martin is one of the most successful of Wren's designs, and is particularly well suited to a position in which it is frequently viewed silhouetted against the mass of St. Paul, the slenderness of the lead steeple forming a pleasing contrast to the greater bulk and more rounded outlines of the western campaniles of the Cathedral. The church which previously stood on the site is stated, by Stow, to have been rebuilt in the reign of Henry VI., and in it was a monument to William Sevenoake, who was Lord Mayor in 1418, and whom legend connects with the town of Sevenoaks, where he is said to have founded a hospital and school.

The present church was rebuilt by Wren and completed in 1634. The advowson of the rectory was formerly in the possession of the abbot and convent of Westminster, but was bestowed by Queen Mary on the See of London.

There were originally three entrances to the church and a gallery along the south and west ends; but the west gallery has been partly removed, the remainder forming an organ gallery, while the south gallery has been done away with, leaving the oak screen and doorways intact. The side doorways in it form the present approaches to the church, which is almost a square in plan. Four columns on high bases in the centre of the church, with corresponding pilasters against the side walls, divide the church into nine square compartments. A cruciform figure is formed by the two segmental plaster vaults which intersect in the centre of the church, rising from the entablatures enclosing the angle bays. The four angle spaces are covered by flat ceilings. The effect of the old brass chandelier which has been hung in the centre of the church within recent years is very successful, and affords an interesting example of the decorative value of suitable fittings, which do more to make or mar the appearance of a building than is often realised. The woodwork of the church is good, and, though it has been partially reconstructed and altered, nothing has been done which destroys the internal effect of a very pleasing design. The three doorcases at the entrance screen, and that of the door leading to the vestry, the pulpit, and altar are all good examples of the work of the period. The well-designed marble font dates from 1673, and was presented by Thomas Morley.

The rectory of St. Mary Magdalen, Old Fish-street, which was situated on the north side of Knightrider-street, in the south-west angle of Old Change, was united with that of St. Martin when the church, which was seriously damaged by fire in 1886, was pulled down. A brass memorial plate of the date of 1586, on which is the figure of an old man in a gown, which is supposed to represent Thomas Berry, a fishmonger, who left a messuage in Southwark to the poor of the parish, has been fixed to the north wall of St. Martin, and with some panelling which was reused in the vestry of St. Martin was rescued from St. Mary Magdalen. The church, as rebuilt by Wren, was a small and simple building, with aisles and with a low steeple. The parish of St. Mary Magdalen was, after the Great Fire united to that of St. Gregory by St. Paul, which, with the church of St. Faith, may be said to have been practically incorporated in the old cathedral, which was described by Fuller as follows:—"Truly the mother church having one babe in her body (St. Faith) and another in her arms (St. Gregory)." Wren seems to have exercised most skill in internal design when dealing with square sites and domed spaces, and was far less successful when dealing with the more conventional problem of the aisled church, which, excepting when the outline of the church, as in St. Clement Danes, demanded an exceptional treatment, are somewhat disappointing.

COMPETITION NEWS.

☞ *It must be understood that the following paragraph is printed as news, and not as an advertisement; and that, while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.*

Alterations and Extensions to Harris Academy, Dundee.

The Dundee School Board, at its meeting last week, considered the report of Mr. Alexander N. Paterson, of Glasgow, the assessor appointed to adjudicate on the designs submitted in connection with the competition for the proposed alterations and extension of the Harris Academy. Mr. Paterson gave his award as follows:—1, Mr. W. B. D. Keith, architect and valuator, 10, Whitehall-street, Dundee; 2 and 3, Messrs. M'Laren, Sons, & Soutar, architects, 10, Reform-street, Dundee; 4, Mr. James Findlay, architect, 33, Albert-square, Dundee. The Board accordingly agreed to pay Messrs. M'Laren the premium of fifty guineas and Mr. Findlay the premium of thirty guineas. The author's estimate of £20,050 has been confirmed by his surveyor as accurate at pre-war rates. To cover present charges this estimate would have to be increased by 27½ per cent.

BOOKS RECEIVED.

Engineering Geology (second edition). By Heinrich Ries and Thos. L. Watson. (London: Chapman & Hall, Ltd. 17s. net. New York: Jno. Wiley & Sons.)

The Welsh Housing Year-Book, 1916. (Cardiff: South Wales Garden Cities and Town Planning Association. 1s. net.)

Lektrik Lighting Connections (fourth edition). Published by A. P. Lundberg & Sons, 477-489, Liverpool-road, N. 6d. net.

Civil Engineers' Cost-Book. By T. E. Coleman. (London: E. & F. N. Spon, Ltd. 6s. net.)

Tacheometer Surveying. By M. E. Yorke Eliot. (London: E. &. F. N. Spon, Ltd. 5s. net.)

Spon's Architects' and Builders' Pocket Price-Book. (London: E. & F. N. Spon, Ltd. 2s. 6d. net.)

THE HOUSING PROBLEM AT GREENOCK.

To assist in relieving the housing difficulty Greenock Corporation have agreed to procee with another extensive scheme. Ground ha been secured in the east end, and at a specia meeting it was decided to accept the tende of the West of Scotland Building Company fo the erection of a large number of houses o the cottage type. Financial assistance is bein given by the Government. A similar unde taking is at present being carried out in th centre of the town, and at the Battery Park th Admiralty are erecting huts for workme engaged in war service.

GENERAL NEWS.

Professional Announcement.

Messrs. Honeyman & Keppie, 257, West George-street, Glasgow, intimate that they have assumed Mr. Andrew Graham Henderson, A.R.I.B.A., as a partner, and that in future business of the firm will be carried on under the name of John Keppie & Henderson.

Consulting Surveyors for Army Purposes.

We hear that Mr. H. M. Cobb and Mr. Edwin Savill, members of the Council of the Surveyors' Institution, have recently been appointed by the Army Council Consulting Surveyors to the Eastern Command.

New Wharf, Dundee.

The new wharf at Dundee Harbour, which has cost £100,000, is now ready for use, but, owing to the existent circumstances, no formal ceremony will mark its opening. It will be known as King George's Wharf.

Institution of Civil Engineers.

At a meeting of this Institution, held on the 11th inst., the following elections of Associate members and admissions of students were reported:—Elected Associate members, thirty-two; admitted as students, three.

A D.S.O. for a Bridlington Surveyor.

In the list of awards of the Distinguished Service Order appears the name of Major Cecil G. Bradley, of the King's Own (Yorkshire Light Infantry). Major Bradley was for five years Surveyor to the Goole District Council. Just prior to the outbreak of war he resigned his position to take up a similar appointment at Bridlington. While at Goole he was in command of the local company of Territorials.

St. Paul's Bridge.

The Corporation of London has obtained Parliamentary sanction for extending the time allowed under the original Act for the compulsory purchase of the properties needed in connection with the construction of St. Paul's Bridge. The negotiations in connection with the proposed new bridge have been suspended, and the City is re-letting on tenancies terminable at short notice many of the properties already acquired.

"Lektrik Lighting Connections."

We have received from Messrs. A. P. Lundberg & Sons, electrical engineers, 477 to 489, Liverpool-road, N., a copy of their new (fourth) edition of "Lektrik Lighting Connections." This edition contains a new section on "Automobile Controls," and various corrections and additions have been made elsewhere. It is a valuable little booklet for everyone who has anything at all to do with electric lighting. The published price is 6d. net.

Building Work and the War.

Mr. James Brown gave an interesting address to the Manchester Society of Architects recently on the relations between the building owner, the architect, and the builder. The present system of carrying out work under contract, he said, was perhaps as near perfection as could reasonably be expected, but from the builder's point of view it was capable of improvement in some of its details, and in view of the building slump during the war this appeared to be the time for overhauling and revising conditions.

The Institute of Industry.

At the recent luncheon which the Court of Directors of the Institute of Industry gave to the Right Hon. Sir Edward Carson, K.C., M.P., the following resolution was carried unanimously:—"That this meeting of manufacturers and other representative men closely connected with all phases of industrial activity in the British Empire fully endorses and approves of the objects and policy of the Institute of Industry (of Great Britain and Ireland), Ltd., and recommends all persons or companies interested in the industrial life of the British Empire to support the Institute by becoming members."

Deceased Architect's Estate.

Lieutenant Samuel Hall, Manchester Regiment, of Cleveleys Hydro., Cleveleys, Blackpool, architect, was killed in Gallipoli on June 4, leaving £22,700.

"Willing's Press Guide."

Messrs. James Willing, Ltd., 125, Strand, W.C., have published the forty-third issue of "Willing's Press Guide," which, following the precedent of former years, has been carefully revised, and supports its reputation as one of the handiest and readiest of reference works of its class. The published price is 1s.

The Surveyors' Institution.

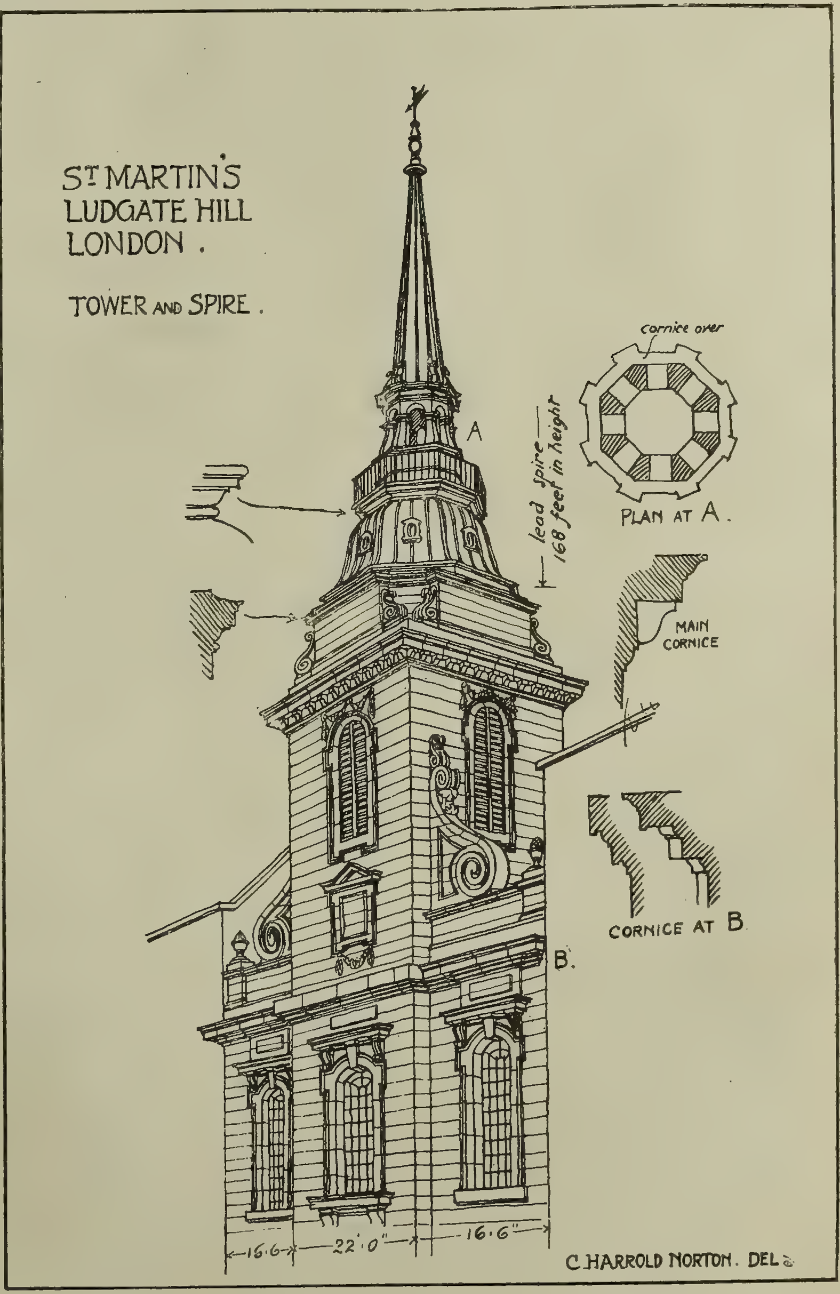
The next ordinary general meeting of this Institution will be held on Monday, February 7, when a paper entitled "Dilapidations—Some Notes and Suggestions" will be read by Mr. C. F. Slater. The Council, in the interests of the attendance, to meet the unusual present difficulties of war conditions, and to secure that full justice should be done to the papers read before the Institution, have decided to change the hour of meeting from 8 p.m. to 5 p.m., and also to reduce the number of meetings to one a month instead of one a fortnight. The remaining ordinary general meetings of the session will therefore be held on February 7, March 6, April 10, and May 8, the meetings on January 24, February 21, and March 20 being abandoned.

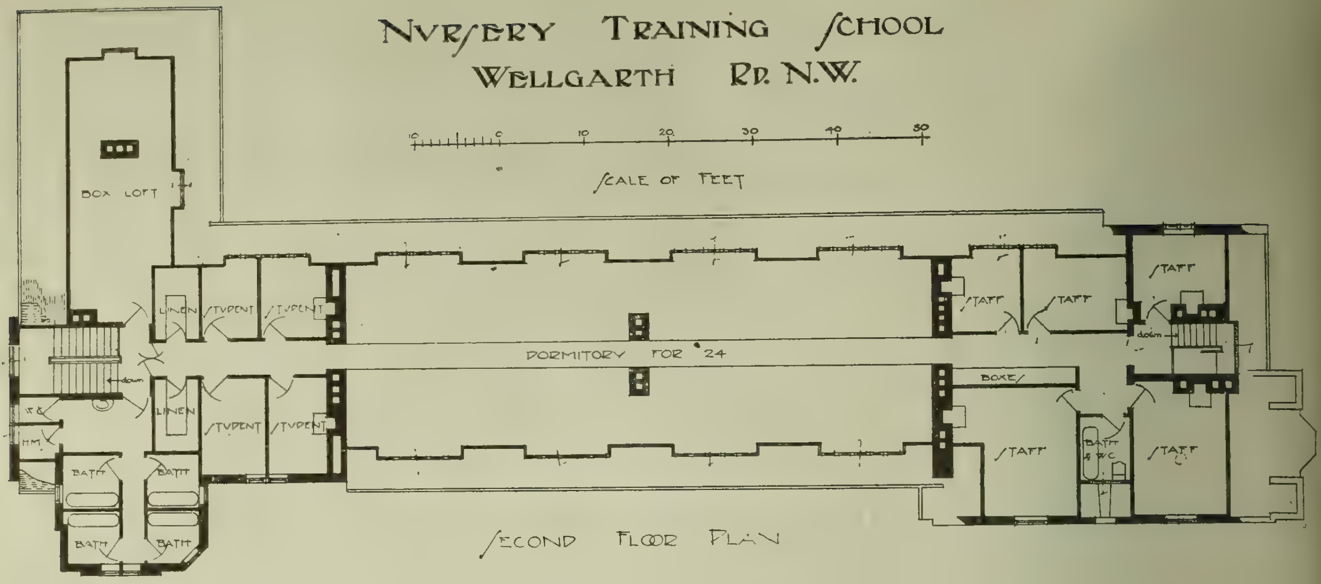
Acoustics at the Old Bailey.

The acoustic properties of the judge's court at the Old Bailey formed the subject of complaint by counsel a few days ago. Mr. Hume Williams, K.C., remarked that he had difficulty in hearing a witness's answers, and said that while addressing the jury the other day he had had the remarkable experience of having his own words hurled back at him. Mr. Justice Darling: "One hears rather well on the bench, but I have heard that counsel experience great difficulty in hearing. I have been told that in a case in which a judge pronounced a sentence of seven years' penal servitude the prisoner was paralysed by hearing a voice from the roof giving him another sentence."

The Building Trade in the Midlands.

The annual meeting of the Midland Centre of the National Federation of Building Trades Employers of Great Britain and Ireland was held in Birmingham on the 12th inst. In the annual Report it was stated that, speaking generally, the condition of the building trade in the Midland Centre during the past twelve months had been very unsatisfactory. It was true that in two or three towns—notably Birmingham, Coventry, and Wolverhampton—the erection or extension of factories required for war work had involved a certain degree of activity, but the demand on the part of private individuals and public bodies for building operations had been insignificant.





Messrs. Lovegrove & Papworth, Architects. (*See page* 67.)

ILLUSTRATIONS.

Restoration of a Portion of the Parthenon Frieze.

THIS work was carried out by Messrs. H. H. Martyn & Co. at the Cardiff Empire Theatre, and is referred to in our Correspondence columns. The "restoration" is a remarkably fine one, and does great credit to Messrs. Martyn.

In reference to these conjectural restorations of the Panathenaic Procession a few facts concerning the acquisition by Great Britain of the Elgin Marbles, with other fragments from the Parthenon and adjacent buildings, may be of interest.

It is now a hundred years ago that public opinion began to favour the purchase of the antiquities known as the Elgin Marbles. Previously, the enterprise of Lord Elgin had been condemned, and it was only after great efforts on the part of a number of enlightened people that £35,000 was voted by Parliament to secure the works now considered to be priceless. The romance of these sculptures forms a fascinating chapter, not only in the history of art, but of international relations. Napoleon and Nelson come into the story, with many other celebrities of a century ago, and no antiquities in the world have more interesting associations.

An architect was responsible primarily for the national inheritance of the Elgin Marbles. His name was Thomas Harrison, and he was employed in 1796 by the Earl of Elgin in connection with a mansion in Fifeshire. Harrison was interested in archæology, and when, in 1799, the Earl of Elgin was appointed to the Embassy of the Ottoman Porte, Constantinople, he suggested to the new ambassador that some of his time might be employed in making the beauties of Athenian architecture and sculpture better known to students. Lord Elgin liked the idea, became enthusiastic when he thought more about it, and eventually planned to preserve records of Greek art within the Turkish dominions.

Lord Elgin gave special attention to the Parthenon, and tried to interest the British Government in the subject. His idea was to obtain casts of the sculpture and drawings of the whole building, so that before the structure suffered demolition, as seemed probable, a complete record should be available in after-years. The Government, however, had other weighty matters to occupy their attention, and their reply was "entirely negative." So Lord Elgin embarked on a scheme of his own, seeking first of all the co-operation of J. M. W. Turner, R.A., and, when that genius proved inaccessible, turning to another artist for assistance. He arranged with Tita Lusieri (a Neapolitan portrait painter), two architects, two modellers, and a figure painter to proceed to Athens. The work of these artists was restricted at first by the authorities, but opposition was removed gradually, scaffolding was placed round the Parthenon, and every facility was granted to the party. As a matter of fact, the Turks cared nothing for the building as an antiquity, and had even pounded down some of the statues to make mortar; but there were political reasons why they did not favour the Elgin enterprise from the beginning.

It had not been Lord Elgin's intention to remove the sculptures, but to obtain plaster casts and measured drawings. But he was so distressed by the indifference of the Turks that he determined to secure the actual Marbles before they were destroyed in ignorance. After negotiations, in which bribery necessarily played a part, concessions were made and several hundreds of workmen were engaged to remove the sculptures from the building. Between 1803 and 1812, when Lusieri left the scene, large numbers of cases containing the precious antiquities were despatched, and some of them did not reach England without adventure. For instance, the *Mentor*, conveying a part of Lord Elgin's cargo, was wrecked near Cerigo, and divers worked for three years to recover the Marbles.

Lord Elgin hoped that when the British Government heard of his success in securing the beautiful relics of the past they would take over the various objects at a price sufficient to cover the heavier expenses. That was all he asked. But his surprise was intense when his offer was not only rejected but his actions were described as vandalism. One connoisseur, who carried great weight, declared that the works could not be attributed to Phidias, as that master had never worked in marble at all; and he believed that the sculptures which decorated the pediments of the Parthenon were executed in the time of Hadrian. Other influential people concurred, and the whole enterprise seemed likely to end in a fiasco. The vicissitudes of fortune which had afflicted the figures through many centuries still continued. Instead of passing direct from Athens to the British Museum, as had been anticipated, they were left in the possession of Lord Elgin, who was at his wits' end to know what to do with them. He would have presented the fruits of his labours to the nation but for the fact that his outlay had been so considerable. He rejected the idea of parting with the treasures to any other country but his own, though his patriotism was sorely tried. His private house in Park-lane had been turned into a museum, but the works still failed to command respect. They were shown at Burlington House ("Athens transplanted to Piccadilly") until the spring of 1815, when, the building having been sold, Lord George Cavendish requested that the Marbles should be removed. The Trustees of the British Museum were asked to take them on deposit, but refused, and the outlook was not encouraging.

The dawn of appreciation came at last, largely through the unconquerable spirit of the ill-fated historical painter, B. R. Haydon. He saw the value of the works and understood their true artistic importance. Other artists joined him in his agitation, and at last a Select Committee of the House of Commons was appointed. They sat from February 29 to March 13, 1816, and tried to sift the evidence. Those who spoke in favour of the treasures included Sir Thomas Lawrence, Nollekens, Flaxman, Westmacott, Chantrey, and William Wilkins, afterwards architect of the National Gallery, who, though he doubted the Phidias tradition, felt bound to admit that the objects were valuable as examples of architectural sculpture. Charles Rossi wrote to Canova and said if he had not seen the Elgin Marbles he had seen nothing. So Canova came to England and added the weight of his appreciation to the project.

It was considered doubtful, however, whether the purchase of the works would be recommended, and still more so when it was intimated that the most powerful advocate of all, B. R. Haydon, would not be examined, "out of delicacy to Mr. Payne Knight" (the oracle of art at that time, who was against the purchase). An international competition seemed to be pending. The King of Bavaria told his agents in London to draw £30,000 as an immediate advance to Lord Elgin, and other European sovereigns were also on the alert for a bargain. But, after all, the Marbles were secured for England. In June, 1816, Parliament rather sulkily voted £35,000 to Lord Elgin, and the sculptures associated with his name were duly removed to the British Museum. His own expenditure, with an allowance for interest, amounted to some £74,000.

It is instructive to reflect on the change in opinion which has taken place in a hundred years. Then only a few realised the value of the imported treasures; now they are regarded with the greatest veneration and are the standard works for study. Watts, the great painter, regarded them as his chief teachers, and scarcely an architect, sculptor, or painter has not learnt something from them since they became available to students in this country.

St. Martin, Ludgate-Hill.

WE reproduce this plate from "The Churches of Sir Christopher Wren," by J. Clayton, which was published by Messrs. Longmans, Green, Brown, & Longman in 1848, and which we give by the courtesy of Messrs. Longmans, Green, & Co. The gallery over the west and south sides has been done away with in recent years, the side entrances blocked up, and the centre entrance remodelled, but our illustration represents the church at an earlier date.

No. 19, Weymouth-Street, W.

THE contractors for this house were Messrs. James Smith & Sons (Norwood), Ltd., of 106, New Bond-street, W.; the wrought-iron work was executed by Messrs. H. & C. Davis & Co., of Clapham; the lift was supplied by the Titan Lift Company; the fibrous-plaster work was carried out by the Modellers and Plastic Decoration Company; and the door furniture by Messrs. C. Harvey & Co.

Nursery Training School, Golder's Green.

THIS building was opened by her Grace the Duchess of Marlborough on December 10, 1915, and has been erected by Messrs. John Greenwood, Ltd., from the designs of Messrs. Lovegrove & Papworth, for the Women's Industrial Council. The building is designed to carry on the work commenced a few years ago in King Edward-road, Hackney, of training girls of the middle classes in the care of young children. The girls live in the school for a year, and are taught elementary nursing, housewifery, and child training, after which they are qualified to accept positions in private families, the demand being far greater than the supply. The children also live in the school, coming from homes where their proper attention is impossible, or from which their absence is advised on medical grounds. The building contains bedrooms and dormitories for the students on the second floor and nurseries on the first floor. Each nursery contains only a small window to the north, but to the south or garden front the whole of the side is enclosed by collapsible partitions leading on to a wide verandah, which can also be enclosed by collapsible partitions, the whole of which have been supplied by the Educational Supply Association.

Externally the building is faced with mixed Amersham bricks, and the roof is covered with hand-made Hartshill brindled plain tiles; internally the walls have been left for the present plain, distempered with jointless cork adamant flooring by Messrs. E. J. Moon. The whole of the joinery is stained with solignum and wax polished.

The staircases are so arranged that access in case of fire is assured to either one or other of the stairs from all upper rooms, irrespective of where the fire breaks out.

The ground floor contains the warden's office, matron's room, student's common room and dining-room, kitchen, scullery, and cloakrooms, all the principal rooms opening on to the arcaded verandah to the south, the north front containing the connecting corridor. In the basement are the laundry drying-room and heating chamber.

The steel construction is by the Aston Construction Company, Ltd., electrical engineering by Messrs. Speedy Eynon; and hot-water installation by Messrs. Potterton & Co. All windows are arranged for cleaning from the inside, the steel sashes and leaded glazing being by the Crittall Manufacturing Company.

Memorial Altar, etc., Wiveliscombe Parish Church.

AT the parish church, Wiveliscombe, Somerset, a new altar, reredos, and east window have been erected in memory of the late Lieut. R. E. Hancock, D.S.O., who was killed in action at Festubert on October 29 last, aged twenty-six. The reredos is of carved oak, and is designed to contain a large central panel with a painting of the Crucifixion, by Miss Mabel Esplin. Mr. F. Bligh Bond, F.R.I.B.A., of Glastonbury, is the architect for the work; and Messrs. R. L. Boullon & Sons, of Cheltenham, are the contractors.

The window (a rose-window) will be filled with glass containing a figure of St. Michael, designed by the architect, and executed by Miss A. M. Erskine, of Stamford.

West Park Presbyterian Church, New York.

THIS church, which is a fine example of Messrs. Carrère & Hastings' work, is the more interesting to us as such buildings in this country, being, as they are, church and institute in combination, are, as treated here, too frequently lacking in dignity and architectural character. Our reproductions are from the *Brickbuilder*, by whose courtesy we republish them.

FIFTY YEARS AGO.

The Liverpool Opera House.

MADEMOISELLE TITIENS has laid the chief stone of the Alexandra Theatre and Opera House on a site in Lime-street, between London-road and the railway-station, where there are three street frontages, the principal one to Lime-street. Mr. A. Salomons, of Manchester, is the architect, and Messrs. Jones & Son are the contractors. The building is to be completed by October 1 next. The report of the directors of the company who are erecting the building states that 3,830 shares have been subscribed for and £4 a share called up. The site cost £15,750. The main walls of the building have been raised 18 in. above the ground, at a cost of £1,457. The estimated cost of the whole is £15,000, for which, says the Report, "the whole of the most modern improvements (including a covered entrance drive) will be carried out, and 1,500 persons will be seated in a theatre second to none in Europe, in comfort, convenience, and good taste. The shops and restaurant included in the proposed building are estimated, by competent authorities, to produce a rental of £600 a year."

SAVING ON PUBLIC WORK.

The London County Council are suggesting to the City Corporation and the borough councils of London that, with a view to effecting economies during the war, arrangements might be made where similar duties are performed by some or all the authorities for their transfer to one authority only for the time being, and, if necessary, for a temporary amalgamation of staffs with that object.

PROPOSED HISTORICAL PAGEANT.

The City Corporation are being asked for the use of the Guildhall on a day in March next for the holding of a great historical pageant in aid of the Young Men's Christian Association's scheme for the provision and maintenance of soldiers' huts.

CORRESPONDENCE.

Conjectural Restoration of the Parthenon Frieze.

We have received the following correspondence in reference to Mr. A. C. Conrade's conjectural restoration of the Parthenon Frieze, an illustration of which appeared in our New Year's issue:—

Sir,—In your journal of the 7th inst. there is illustrated a "Portion of the Parthenon Frieze, being a conjectural restoration by A. C. Conrade."

We should like to make our position perfectly clear on this matter, as we have no doubt you will understand our astonishment at the publication after we have explained the facts. Enclosed we have pleasure in sending you photographs of the "Restoration of the Parthenon Frieze," which we have recently designed and executed at the Cardiff Empire Theatre. We were requested by the architect to send to Mr. Conrade copies of these photographs on September 13, 1915. This frieze was then completely modelled and designed for the Cardiff Empire Theatre without relation to any suggestions from Mr. Conrade, and, in fact, without his knowledge until that date.

We feel sure that it will be apparent to you that the sketches illustrated are, in principle, almost replicas of the photographs which we supplied to Mr. Conrade, with the exception of the lower panel. We would more especially point to the two central panels illustrated, which have apparently been very closely worked to from a technique point of view.

We would, therefore, ask you to kindly give the fullest publicity to this fact, and also to publish the photographs with our name attached in your next issue.

H. H. Martyn & Co., Ltd.,
Sculptors and Architectural Decorators.
Cheltenham.

We communicated with Mr. Conrade, and the following is his reply:—

Sir,—I am truly sorry if I have in any way annoyed Messrs. Martyn. If so, it was quite unintentional on my part. I have had a student's ticket for the Græco-Roman Department of the British Museum for years; have shown and "restored" nearly everything there; and it is hardly likely that the frieze would have escaped me. My drawings are based upon the frieze itself (as the photographs of the latter will show), and also upon John Henning's restoration (1829-30).

Messrs. Martyn will pardon my saying so, but I have at least as much right to restore a dilapidated frieze as they have. In two restorations of the same thing there must be at least some resemblance. And I think everyone will admit that a further examination of their frieze and mine will show differences throughout.

In any case, should I have unwittingly offended Messrs. Martyn, I hope that they will accept my acknowledgments and apology.

I shall be pleased to answer any further inquiries. Alfred Charles Conrade.

P.S.—In reference to the Cardiff Empire Theatre, for which Messrs. Martyn's frieze was executed, I may say that I painted the act drop for this, and did nothing more.

I introduced part of the frieze into this in June, 1915, illustrated in the *Builder*, October 8, 1915 (some time before the date, September 13, 1915, on which Messrs. Martyn say they wrote me, as was the case). The sketches you had were completed before then by some time.

The Committee of the Moss Empires approved my sketch, as can be seen in the letter from the architects (Messrs. Milburn, of Sunderland) of June 25, 1915, to me, confirming the order. I wrote Messrs. Martyn, offering to model the frieze, but they replied, under date July 22, 1915, that that matter was settled. Still, I offer Messrs. Martyn complete and unconditional apology and regret for any wrong I may have done them, or for anything for which I am indebted to their frieze. A. C. C.

[*** We give, in one of our inset plates this week, the illustrations referred to in Messrs. Martyn's letter. We may add that in publishing in this issue Messrs. Martyn's admirable restoration of a portion of the Parthenon Frieze executed by them at the Cardiff Empire we are giving the most emphatic and convincing testimony to the statements made in their letter. We may remark that we published Mr. Conrade's drawings in good faith, without knowing that he had the data which it now appears clear he had to draw upon.—Ed.]

TEMPORARY BUILDINGS FOR WAR PURPOSES.

By T. P. Bennett, A.R.I.B.A.

VARIOUS war purposes have rendered necessary the rapid erection of extensive temporary buildings, and the need for meeting this demand has called into existence many new problems for the architect and the builder.

It is probable that twelve months ago few experienced men had realised the enormous difference between building conditions in the heart of towns and those prevailing upon the sites frequently selected for large army camps and munition factories, and the full extent of the difference was only appreciated after the erection of large numbers of buildings in these isolated districts.

For various very practical reasons, most of the sites selected for such structures are several miles from any large towns, and are a considerable distance from the nearest railway-station.

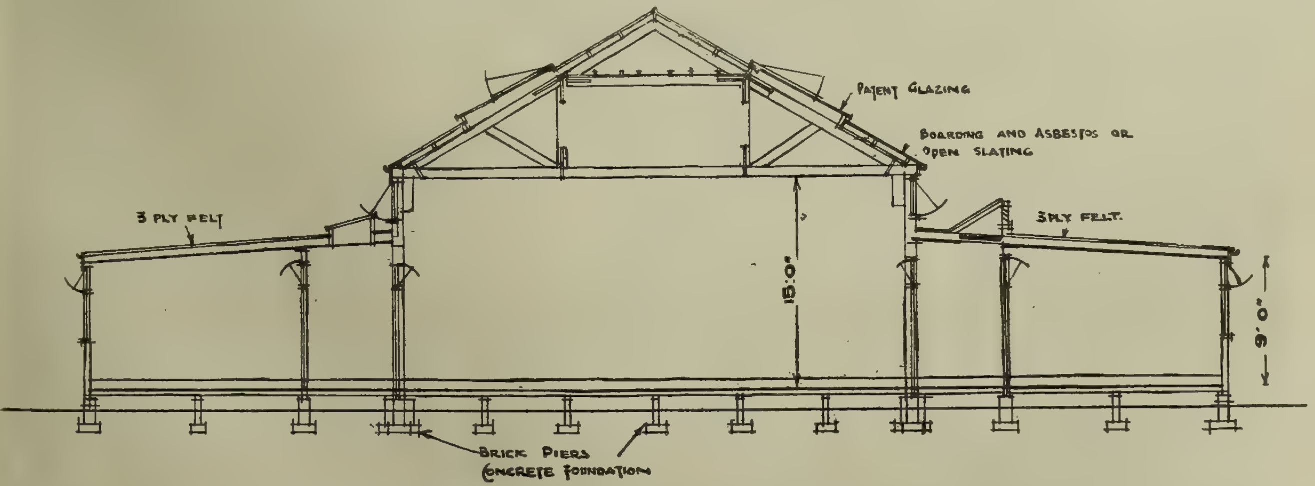
The first problem that presents itself for solution, therefore, is not one of planning or construction, but of transport. The primary consideration is speed, and this factor must often over-rule all others in importance. Experience has proved that organisation will play a leading part, both in economy and in rapidity of erection. Organisation and transport are closely allied, and are therefore the two factors which will first receive consideration.

Many points will be found to affect the decision that is to be made as to the best means of delivering men and material, but for practical purposes they may be summarised under the following heads:—

1. The distance of the site from the nearest railway.
2. The nature of the intervening ground.
3. The size of the building programme.
4. The nature of the roads.

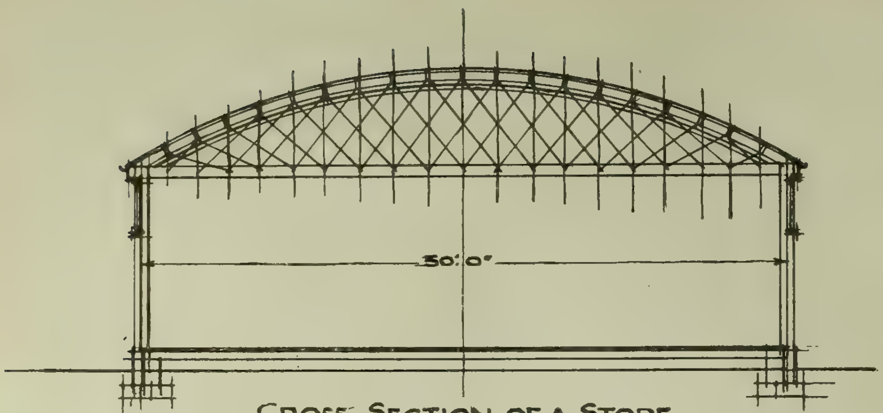
1. In dealing with large schemes a railway should *primâ facie* be considered a necessity. If the building is less than 2 miles from the nearest siding, and the intervening ground is fairly level, no hesitation need be felt in incurring the capital expenditure which will be involved. When complete, the railway needs far less attention than road transport, and is very much cheaper; but apart altogether from these considerations are other factors which sometimes present insuperable obstacles to road haulage and render a railway a necessity. The first is the increasing difficulty that is experienced in obtaining steam wagons or motor lorries. Broadly speaking, they are unobtainable upon a large scale in districts far removed from ordinary trade centres. If road transport is employed it is furthermore necessary to keep to main roads, of which more will be written later. When the site is more than 2 miles from the main line connection, a railway may still be the most economical means of dealing with haulage; but the increasing initial cost becomes an item for serious consideration.

2. Great distance, coupled with hilly country, may be a strong argument in favour of road traction if the road surfaces are good. Gradients of more than 1 in 20 render a railway expensive and difficult to work, and often cause serious damage to locomotives, besides getting rapidly into bad condition in wet weather. Steeper gradients are not impossible, especially if they are short, and a 13-in. cylinder locomotive will carry about six or seven trucks up an incline of 1 in 11·5 if each truck is loaded with not more than from 3 to 5 tons of material.



CROSS SECTION OF AN OFFICE BUILDING.

Fig. 2.



CROSS SECTION OF A STORE

SHEWING A BELFAST ROOF.

Fig. 3.

It follows that, if a railway is to be constructed with a maximum gradient of 1 in 20, hills will necessitate a large amount of excavation. Excavation is costly and slow, and labour of any kind, especially navvy labour, is now exceeding scarce.

3. Apart from initial cost, rail haulage is considerably cheaper than road haulage, and if the total quantity of material is sufficiently large the railway will pay for itself many times over. The cost of the construction of a railway at the present moment, including material and labour, is about 30s. to £2 per yard run, allowing for a depth of about 1 ft. 6 in. of excavation. The cost of road haulage is about 1s. 3d. to 1s. 6d. per ton per mile, irrespective of the cost of road repairs. The cost of haulage upon a railway after it is completed is about 1s. per ton per mile, including shunting and delivery to sidings and spurs—one journey only to be measured in each case.

4. The nature of the roads is often the crux of the whole matter. Ordinary country roads built for light motor traffic are perfectly useless for steam wagons and heavy material. Frequently such roads have only a crust of 4 in. to 6 in. of macadam without any bottom, and break like thin ice under the weight of motor lorries loaded with building plant and material.

The condition to which a road can be reduced in a short time is inconceivable until it has been experienced; but after one or two cases of badly-smashed highways every effort is made to approach by rail, although large capital outlay may be involved.

The value of sleepers and rails as second-hand material is a point that should not be overlooked.

The next consideration in arranging the scheme is the level of the ground in various parts of the site. Speed demands that no time must be lost upon foundations, and unless a site is very flat a great amount of brickwork will be required for sleeper walls and concrete piers. The eye should not be trusted in such matters, and arrangements should be made to level the ground as soon as the position of the buildings is provisionally agreed. It is not uncommon to find, after pegging out, that the site for a building 200 ft. long falls 7 ft. in its length, although the maximum difference in level was judged to be about 2 ft.

After settling the site, some provision should be made for housing the men. Labour is scarce, many of the sites are very exposed, and if artizans and labourers arrive and find no provision made for them they can, and will, obtain work elsewhere. In most contracts special inducements are offered to the men over and above ordinary allowances. Such inducements take the form of free fires, cooking utensils, travelling allowances, etc. It will probably be necessary to advertise for labour, and some novel methods have been employed in this direction. One contractor utilised the screens of the picture palaces for miles around, and arranged for the display of a notice somewhat on these lines:—

ARTIZANS AND LABOURERS!
Come and help your country by building huts for housing the Army.

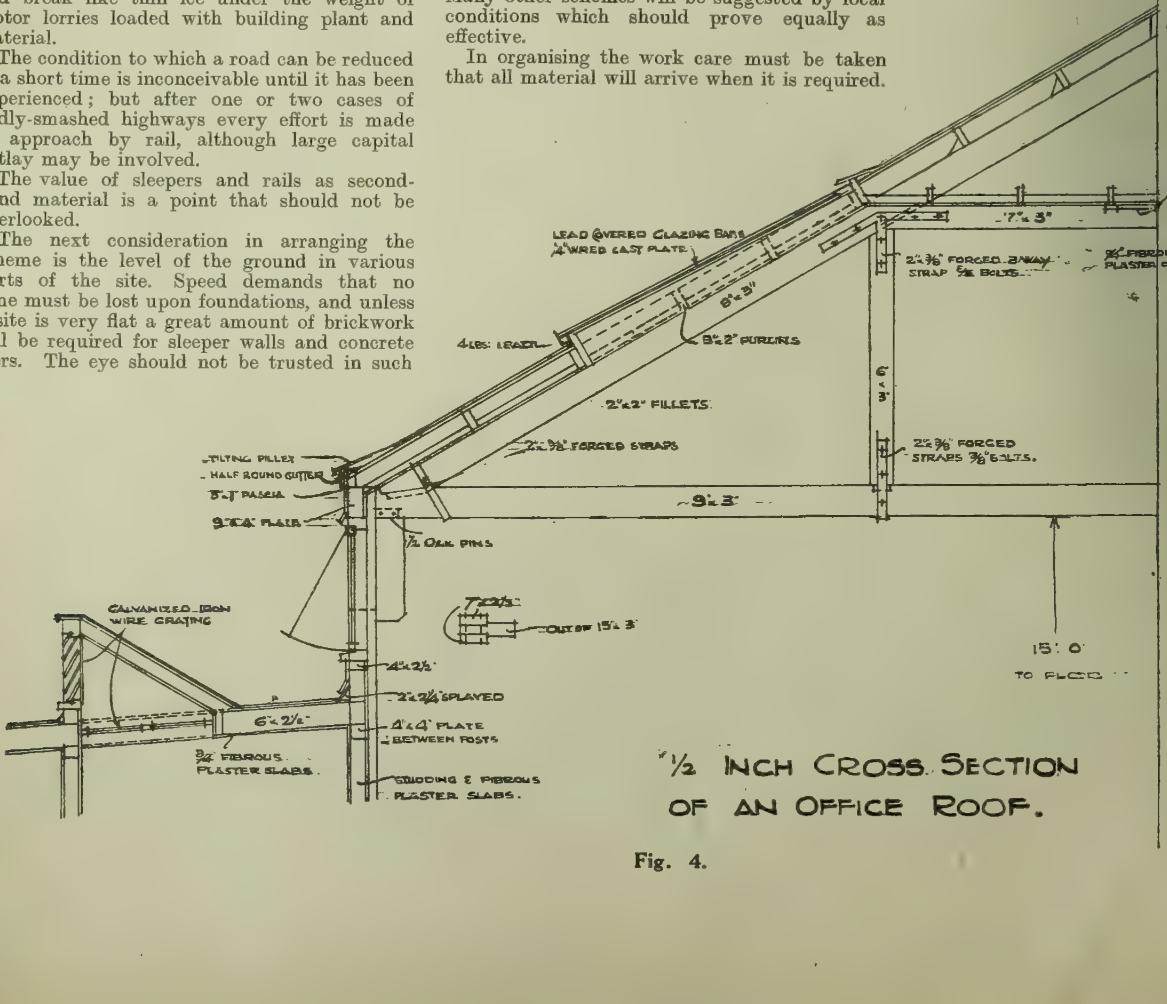
Many other schemes will be suggested by local conditions which should prove equally as effective.

In organising the work care must be taken that all material will arrive when it is required. Many contractors have not made due allowance for the shortage of supplies, for the congested state of the railways, and for the fact that ships are almost unobtainable. Contracts have been in consequence seriously delayed, and disorganisation has inevitably followed.

With regard to the type of building that is to be adopted, it should be borne in mind at the commencement of the work that all men who present themselves must be taken on and difficult setting out is therefore to be avoided.

Every building, and every portion of the building, must be plain and straightforward. As many repetitions as possible should be used, and types should not be varied unless there is special reason for doing so. This means that a minimum number of highly-skilled men is needed; the risk of mistakes is reduced to the greatest possible extent and economy is secured. Upon account of the lightness of construction, wind pressure assumes a position of greater importance than it ordinarily occupies, and it is therefore advisable to avoid high-pitched roofs and large spans. When, as is generally the case, timber construction is employed, large spans necessitate large scantlings, and baulk timber is both scarce and costly. The handling of beams upon the work also involves additional tackle and more men.

If large unobstructed areas are, however, desirable, the roof may be spanned either with a queen post or Belfast truss. A section of an office building, showing the former, is illustrated in Fig. 2. In this case, stiffness was attained by hipping the ends of the roof, as shown in elevation Fig. 1; and the employment of hips in such a manner is a justifiable expense. The individual members of the truss may be made much smaller than is customary on account of the lightness of the roofing material and the temporary nature of the building. The sizes given in Fig. 4 were used for a 35-ft. span. Lack of ventilation in top-lighted rooms is guarded against in the section shown in Fig. 2, additional light being also obtained by means of the clerestory windows. The low-pitched roofs over the corridor and side-rooms shown in this section consist of plain 6-in. by 2½-in. rafters, with 6-in. by 3-in.



½ INCH CROSS SECTION OF AN OFFICE ROOF.

Fig. 4.

rimmers to carry the roof lights. Small blocks re covered by a simple collar roof; wide span oofs over shell stores are frequently of the Belfast type, such as that shown in Fig. 3, which will be again referred to later.

The construction of the walls and roofs is a matter that has received much consideration, nd experience has proved that wood-framing overed with weather-boarding or corrugated-ron is, as a rule, the cheapest and most rapid method of erection.

Other types of buildings are, however, more uitable for some purposes, and are enumerated below.

1. Buildings constructed of concrete blocks. These have given good results, but they are ostly and cause delay. Before erection can e commenced a large number of machines must be brought to the site and a considerable amount of time and money must be spent upon foundations. Frosty weather prohibits progress altogether, and may destroy many f the blocks which are not thoroughly set. Further than this, a rough or uneven site will ause greater difficulty and expenditure than s the case with timber buildings. Upon the other hand, the building is more weather-proof, more equable in temperature, and will cost ess for maintenance.

2. The second method that may be con-idered is the employment of steel framing, xpanded metal lathing, and cement rendering. The chief difficulties that will be incurred are he delay and expense in obtaining delivery f the steel, the length of time occupied in xing, and the necessity for the employment f highly-skilled labour.

It is only in comparatively rare cases hat buildings of this type can be justified, ut a variation has been employed by dopting timber framing, steel lathing, and ement rendering. This method is successful o some extent and produces a building of a emi-permanent character. It is, however, mpossible to lay the cement in frosty weather, nd defects frequently appear from the hrinkage of the studding, which causes the laster to crack.

The cheapest and most usual type of building, s before stated, is constructed of wood studding overed with weather-boarding or corrugated-on sheeting, and roofed either with boarding nd felt open slates or asbestos tiles, or with cor-ugated-iron. Weather-boarding is cheaper than on and is more easily obtained. Upon the other and, iron makes a more weather-proof building, nd the cost of black iron is not very greatly excess of wood. Three-quarter-inch by -in. by 4-in. to 7-in. weather-boarding is ufficient for ordinary purposes; and $1\frac{1}{4}$-in. by -in. rebated for more important structures or uildings which must be reasonably draught-roof, such as hospitals. The sides of the uts should be formed of 4-in. by 2-in. or 4-in. $2\frac{1}{2}$-in. studs, 4-in. by 4-in. angle posts, in. by 3-in. plates, and 4-in. by 2-in. noggings. o timber larger than 4 in. in its smallest mensions should be used, as all sizes above is must be sawn from baulk, causing delay d expense. Posts carrying large span roofs ould be built up of smaller scantlings (see gs. 2, 3 and 4). Thus, an 8-in. by 7-in. post a 30-ft. to 40-ft. span would be built of 7-in. by $2\frac{1}{2}$-in. and 1 7-in. by 3-in., bolted gether with $\frac{5}{8}$-in. bolts 1 ft. 6 in. apart, placed zag.

The roofs should be covered with $\frac{3}{4}$-in. rough ards and patent roofing felt. The con-uction is light and the various members of e trusses can be made correspondingly small. mensions are given in Fig. 4 for a queen st truss for a 35-ft. span. Spans greater an this should be covered by a Belfast roof, shown in Fig. 3, which is a diagram rectly set out. The majority of these trusses own in books are incorrect, and many of them uld fail if an unexpected load were applied. e individual members of Belfast trusses small, and can frequently be obtained m the off-cuts of other timber. The mensions for a 40-ft. span are as follows:— beam or bottom boom, Fig. 4, 8-in. by $\frac{3}{4}$-in. in rib; Fig. 4, 2-in. by $1\frac{1}{2}$-in.; braces, 3 in. by n. or 3 in. by 1 in. The braces should run ough the main rib, and should be spiked to purlins, thus stiffening the truss and ucing the stress in the main rib.

The centre member of the posts supporting the trusses should be stopped short, and the tie beam should run through between the outside pieces, the whole being connected together by means of bolts. The bottom of the posts should be built into concrete or brick piers, and the plates well spiked to each side. These buildings are light, and high winds will lift off the roofs, or will raise the building bodily if the situation is exposed and they are not well secured.

The eaves of the roof should project well over the sides, and if economy is a primary consideration it is possible to dispense with eaves, gutters, and R.W.P.'s. The roofs should be felted with some well-known felt such as Anderson's, Engert & Rolfe's, McNeill's, Ruberoid, or the Willesden Waterproof Sheeting. Eaves gutters can be C.I. or made V-shape, and constructed of wood. The felt should be nailed over the edge of the boarding with galvanised-iron nails. Valley gutters can be laid in C.I. or lead, but, if the work is large enough to justify the carriage of asphalting plant and the employment of skilled men, asphalt gutters are more satisfactory. Felt gutters are never safe from the possibility of leakage, and most of them will not hold water if tested immediately after completion. If lead gutters or flashings are used, 4 lb. lead is sufficiently heavy for all purposes. It is cheaper to insert additional walls and piers and use small timber for the floors than it is to use large spans and correspondingly large binders or bridging joists.

If the foundations finish at ground level, concrete piers are cheapest and best, and the posts can be inserted in them after being coated with Solignum. Plates are carried on the top of the piers. If the floor of the building is far above ground, brick piers are preferable and cheaper. Those which carry the main posts should be constructed with a $4\frac{1}{2}$-in. skin and 9-in. by 9-in. clear inside. The post is inserted in the centre of the space formed and packed around with concrete.

The finish, decoration, and cost of these buildings cannot be touched upon in so short a space, and attention has been confined therefore to the broad lines of the commencement of the work and general arrangement of the structure. It will be seen that speed and economy are the two essential features, and most other considerations must be sacrificed for the attainment of these points. The question of economy is, however, very wide, and does not consist of the adoption of a cheese-paring policy. Almost it might be said that the opposite is the case, and that true saving is effected by a comparatively lavish expenditure in organisation and preliminary work. Such expenditure, however, must be directed by knowledge and experience, and the speed of erection renders these qualities of inestimable value. In an ordinary building a mistake can be rectified, and becomes an incident. In war building a mistake is immediately magnified into a serious blunder.

A comparatively large amount of consideration should therefore be given to preliminary points until an intimate knowledge of new conditions has been obtained. If this is done, architect, builder, and owner will be saved a large amount of that anxiety which is an invariable attendant upon very rapid operations.

SCHOOL, WOOLACOMBE, DEVON.

The new County Council school which has been provided for the children of this little seaside resort and its neighbourhood has recently been opened. The school, which is situate on the left-hand side of the road approaching the village from the railway-station, is a building of local stone, faced with waterproofed cement, with a rough-cast finish, and having a slated roof. The site, comprising $1\frac{1}{4}$ acres, is enclosed in an unclimbable iron fence. The school is divided into three classrooms, and is entered by a spacious corridor. The walls have been coloured with water paint, and the floors are of wood blocks. The building has cost £2,000. Mr. Morris (Architect to the County Education Authority) and Messrs. W. Slee & Sons, builders, of Barnstaple, have been responsible for building the school.

STEEL BARS FOR REINFORCED CONCRETE.

ONE object to be kept in view when designing structures of reinforced concrete is to prevent, or minimise, the cracking of surfaces exposed to tension. The employment of high-grade steel tension bars stressed only to a moderate degree is one of the best means to the desired end. If, instead of mild steel with an ultimate resistance of about 30 tons per square inch and an elastic modulus of 30,000,000 lb., we adopt a "medium" steel in which the foregoing figures are increased by one-third—ultimate resistance 40 tons and elastic modulus = 40,000,000 lb.—experience shows that cracks in the concrete rarely, if ever, occur, except when so minute as to be negligible, provided always that the working stress does not exceed that which is customary with mild steel, viz., 7 to 8 tons per sectional square inch.

It is characteristic of the above-named medium steel that bars of small diameter show a higher degree of strength per unit of sectional area than those of larger diameter. This is attributable to the fact that the smaller bars have undergone a greater amount of working in proportion to their size. We have, for example, found, in the course of some experimental tests, that $\frac{1}{2}$-in. circular bars showed an ultimate tensile resistance of over 42 tons per sectional square inch, whereas $\frac{3}{4}$-in. bars of the same material showed a resistance of only 38 to 39 tons. Hence, in designing, it would be more economical to employ eleven $\frac{3}{8}$-in. bars, with a combined ultimate resistance of 50·6 tons, than three $\frac{3}{4}$-in. bars, with a combined resistance of 50·7 tons. This would mean a saving of one $\frac{3}{8}$-in. bar, or about $4\frac{1}{2}$ lb. per foot run of bars; while the amount of surface available for the adhesion of concrete with the larger number of small-sized bars would be nearly doubled.

From numerous experiments upon mild steel bars we are unable to find any difference in strength per unit of sectional area between bars of small as compared with those of large diameter. The principal advantage of using mild steel arises, of course, from its extreme ductility. Thus, for example, we have found, from experiments upon mild steel, as much as 30 per cent. elongation in a length of 8 in.; whereas medium steel rarely shows more than 15 per cent. Nevertheless, in this latter material circular bars can be bent cold to any angle required in reinforced concrete construction.

It might seem superfluous to issue a word of caution as to the importance of ensuring that bars shall always be supplied of the sizes specified; but experience warns us of the necessity of constant vigilance in this respect. In one case we have found that bars supplied as nominally 1 in. square were actually only $\frac{7}{8}$ in. square. This means a deficiency of nearly 25 per cent. in sectional area. In round bars we have occasionally found even more serious shortages in diameter. Thus, bars nominally $\frac{3}{4}$ in. were, in one case, found to be 25 per cent. less, which means a reduction of 44 per cent. on the sectional area; and such a bar, if nominally stressed to 8 tons, would be actually stressed to over 14 tons per sectional square inch. Such extreme cases are, of course, exceptional.

Much has been said and written in favour of an indented form for tension bars. It may be observed that, in the case of an ordinary unindented bar, the resistance to displacement by drawing out arises from the adhesion of the concrete to the steel. In an indented bar the resistance is due to the cohesive strength of the concrete between the unindented portions of the bar. We have heard it suggested that, since the resistance in either case is to be overcome by shearing, there is practically no difference between the two forms of bar. We would point out that in the case of an ordinary bar the shearing would take place upon a straight joint between two different materials, whereas in an indented bar it would be through an irregularly bonded material. In either case we have little absolute data for our guidance. Perhaps some readers of this journal can throw some light upon the question from their own experience.

Q. E. D.

KING WILLIAM-STREET.

THE transformation of this street has been very rapid. Beginning with the end next the Mansion House, first came the imposing block for the Scottish Union and Provident Association, by Messrs. Dunn & Watson, now to be extended as far as St. Swithin's-lane, over the site of the old Gresham Club, which is to be rebuilt in Abchurch-lane. Going southwards on this side we have the austere little corner building of the Clerical Medical and General Insurance Company. Next comes the only gap in the line at the corner of Sherborne-lane. This corner, not being in the same ownership, may remain in its present state for many years. The next block up to Abchurch-lane contains the fine new offices of the Phœnix Assurance Company, by Messrs. Macvicar Anderson & Son.* Following this up to Nicholas-lane, we have the new premises of the Comptoir National d'Escompte de Paris, now being built. It is a pity this site is of such an awkward shape, but the powers of the Corporation in the days when King William-street was formed were limited, when only properties immediately infringing on the new street could be acquired, thus forming very irregular sites. This difficulty has been overcome in the next block by an arrangement whereby the City Lands Committee acquired adjoining lands upon the assurance that a lessee was forthcoming for the new site when so made. This island site will be one of the most prominent and valuable positions in the City. The war has temporarily delayed its development.

On the other side of the street the whole of the rounded corner facing London Bridge will probably be rebuilt. The portion in Gracechurch-street belonging to the City Lands Committee was let to Mr. Howell Williams, who intends to erect a large block of commercial offices. Adjoining it is a block in which the leases expire in about two years. At the corner of Clement-lane the Norwich Union has erected a small branch office. Proceeding north, on the site of the old London and Lancashire Offices will be shortly erected a new block of offices by Messrs. Trehearne & Norman upon an enlarged area formed by the acquisition of the back property.

At the corner of Nicholas-lane a small building is in course of erection by Messrs. Metcalf & Greig.

This side of the street was partly rebuilt about 1880, and no more leases will fall in now for many years. The only other change since the street was formed is that which was caused by the building of the Bank Station of the City and South London Railway under the church of St Mary Woolnoth.

The new aspect of the street, although not perhaps so dignified and reticent as the old, will nevertheless be as fine as any in the City. The old heights are increased, and will now give a street of equal width and height. This is the inevitable result of the Building Act Regulations and our ancient light conventions. In our view it is a proportion less satisfactory than an excess in either direction would give. The best results are got when the buildings either do not exceed three-quarters of the width or are allowed to go up to one and a half times the width. We might learn a good deal from the American and Continental rules about heights of buildings, and the next revision of the Act should certainly deal with this point.

NEW ALTAR FOR CHURCH AT KELSO.

A new high altar has been erected in the church at Kelso, Roxburghshire. The altar, which was designed by Mr. Archibald Macpherson, F.R.I.B.A., is built of Swinton stone, with a baldachino of Spanish mahogany.

A NEW CALENDAR.

We have received from Messrs. F. Troy & Co., builders, decorators, and electrical engineers, 194 and 196, Finchley-road, N.W., a neat little calendar for 1916 which shows an excellent colour reproduction of the picture entitled "Every Little Helps," by A. W. Strutt, R.C.A., A.R.E., with a monthly calendar attached below.

---

* See our issue for January 7.

REINFORCED CONCRETE.

WE have received the following letter in reference to the paper by Mr. Kearns, read before the Surveyors' Institution recently, and reported in our last issue:—

SIR,—In the report of the paper read by Mr. R. Kearns, before the Surveyors' Institution, which is included in your last issue, you state that Mr. Kearns made allusions to the New Cathedral at Demerara (which is now being constructed to the designs of Mr. Leonard Stokes, upon the Considère system of construction), and also ask whether there is any cause why the rods in beams should not be made larger in section and fewer in number.

You will probably receive letters from other correspondents, giving the reasons against this proposal, but, in case you do not, it may be useful to point them out as concisely as possible.

In reinforced concrete the tensile stress in the steel bars is only transmitted to them through the medium of the concrete, and this transmission of stress is only possible on account of the adhesion of the concrete to the steel.

Since the area of a round bar varies as the square of the diameter, whereas the perimeter is only directly proportional to it, it is obvious that, for any given sectional area, the largest adhesive surface will be obtained by putting in a number of bars of as small diameter as possible. The new London County Council Regulations are stringent on this point, and will control the diameters of bars pretty effectively.

With bars of large size and few in number there is no possibility of their full tensile value being developed, as they would undoubtedly slip before their full strength was realised. The possibility of slipping can, of course, be guarded against by the introduction of the Considère hook at the ends of the bar (as suggested by the London County Council Regulations), but in good design it is better to regard this hook as offering additional security, and not to count upon it in the first instance as assisting in the transmission of stress from the concrete to the steel. As the adhesion may be regarded as constant throughout the length of the bar it is only the increment of strength per unit length which has to be transmitted from the concrete to the steel, whereas, if there was no adhesion and the bars were only held by the hooks at the end, the tensile force would be constant to the end of the bar, and the whole of the anchoring would have to be done by the hook.

This would be rather analogous to placing one huge rivet at each end in building a girder, instead of a number of small rivets spaced along the entire length of the plate.

CONSIDÈRE CONSTRUCTION COMPANY, LTD.
(Herbert E. Steinberg).

CONSTRUCTION NOTE.

Grain Elevator Plant, South Chicago.

THE John S. Metcalf Company, Ltd., Southampton-street, Strand, London, W.C., has recently been retained by the Chicago and North-Western Railway Company to act as designing and consulting engineers for their new grain elevator plant at South Chicago. This plant will be operated by the Armour Grain Company. It comprises a working house of a million bushels capacity, with facilities for receiving grain at the rate of 360 cars in ten hours and shipping to cars at the same rate. At the same time it will be arranged to dry 90,000 bushels of grain and bleach 240,000 bushels of oats in ten hours, besides enormous clipping and cleaning capacities. There will be a marine tower for receiving from vessels at the rate of 20,000 bushels per hour, and a river house equipped to ship to boats at the rate of 120,000 bushels of grain per hour, and with a shipping gallery to carry grain out along the wharf for trimming the vessels after they have received the bulk of their load at the river house. Between the working house and the river house there will be a storage house, which will bring the ultimate storage capacity of the plant to approximately 10,000,000 bushels. All the machinery will be electrically driven, deriving power from a complete independent power plant of 4,700 horse-power. Water tube boilers and turbo-generators will be used. Complete facilities will be provided for collecting the dust caused by the handling and cleaning of the grain and for sacking this dust or loading in bulk. An independent office building for convenience of the operators, a welfare building for employees, a shop building, and 1,200 ft. of wharf are also included in the work. The headquarters of the John S. Metcalf Company, Ltd., is in Montreal, Canada, with branches in London and Chicago.

ARCHITECTURAL SOCIETIES.

Nottingham and Derby Architectural Society.

The second meeting of the winter session of this Society was held at the Society's room on the 11th inst. Mr. F. M. Royle, the Hon. Secretary, informed those present that a Christmas greeting had been sent on behalf of the Society to each of the twenty-six members on active service, to which the President and Vice-President had added a box of cigarettes. He had received very interesting replies, thanking the members for their kind wishes. The President proposed that a selection of the letters might be made and printed in the next annual Report, and this suggestion was agreed to.

After the disposal of other business the members adjourned to the lecture-room, where the Rev. F. N. Heazell, M.A., F.R.G.S., delivered a lecture on "Baalbeck and Damascus," which he illustrated by a number of lantern slides, mostly prepared from photographs taken by himself. He stated that Baalbeck is reached from Aleppo by a railway journey of eleven hours. The chief object of interest is the ruins of the great Temple of the Sun. In the time of the Roman Emperors, Baalbeck was the central point of an Oriental form of worship which had existed from very early times. The ruins are entered by a modern flight of steps, which lead to the propylæa, and this admits to the hexagonal forecourt by means of three gates. Through the western gateway of the forecourt the Great Court—450 ft. by 400 ft.—is reached, surrounded on three sides by double rows of columns, while in the centre are the great altar of burnt offerings and the basins of lustration. On the fourth side of the court a great flight of steps led up to the front of the Temple of the Sun, a building 290 ft. long by 160 ft. wide, having a peristyle of fifty-four columns. Only six of these columns of a debased type of the Corinthian Order, and the bases only of many more, now remain. A short distance from this temple stands the Temple of Bacchus, perhaps the finest building in anything like a fair state of preservation i Syria and Palestine. The main entranc doorway is beautifully carved, but nothing o the roof remains. These wonderful building were probably erected by Antonius Pius between A.D. 130 and 160. The Empero Theodosius built a Christian church within th Great Court in the fourth century, while anothe part of the buildings has been used for Moslen worship.

The lecturer then showed views and gav a description of Damascus, which has bee called the oldest city in the world—the oldes city, that is, that has maintained a continuou existence from the days of its foundation unti the present time.

At the close the Vice-President, Mr. H. G Watkins, proposed and Mr. E. R. Sutton, Past President, seconded a vote of thanks to th lecturer for his interesting paper. The Re F. N. Heazell suitably replied, and the meetin terminated.

OBITUARY.

Mr. E. Clark.

The death is announced of Mr. Edwin Clar principal of a firm of builders, at Fishpond Bristol, who have been contractors for vario chapels erected in and around the city.

Mr. J. P. Sharp.

Mr. J. P. Sharp, a Birmingham architec of County-chambers, has died at his Mosel residence. He designed a good ma Birmingham buildings and took a leadi part in the development and construction Corporation-street.

THE BUILDING TRADE.

THE TIMBER TRADE.

MESSRS. FOY, MORGAN, & CO. have issued their annual Report, which contains some very interesting statistics. The imports into the United Kingdom and their value are for the last six years as under :—

1910	10,078,088 loads	£26,198,854
1911	9,740,436 ,,	25,847,077
1912	10,058,384 ,,	28,351,315
1913	11,589,811 ,,	33,789,356
1914	8.432,646 ,,	25,336,951
1915	7,665,524 ,,	32,778,764

The imports of soft woods sawn and planed, with which portion of the import the building trades are almost exclusively concerned, have been practically the same as in the previous year. As the war has now affected two shipping seasons, it is a matter for congratulation that the imports stand at within 20 per cent. of previous figures. The Board of Trade have suppressed certain figures relating to timber used for Government purposes, so the figures are vitiated to that extent. A fair estimate of the proportion in which the £7,000.000 extra paid for the same quantity of wood imported would be to put down £2,000,000 as the extra price paid, and £5,000,000 for extra shipping charges.

The fluctuations of the freight rates in the average import cost per standard year by year and the influence of high freights are shown in the following figures :—

	£ s. d.		£ s. d.
1907	9 11 0	1912	9 18 3
1908	8 16 6	1913	10 9 3
1909	9 0 3	1914	10 13 0
1910	9 9 3	1915	15 11 0
1911	9 9 0		

Russia, after steadily gaining on all competitors since 1901, when she first took the lead, has now dropped to a position of minor importance. In the year prior to the war Russian imports represented more than half the total import, but during the last season she has not even imported one-fifth of the total.

The following table of figures shows the stock of wood in the London public docks at the end of each year :—

PUBLIC DOCK STOCK ON DECEMBER 31.

		1913.	1914.	1915.
Deals (Fir)	Pieces	1,641,245	906,520	919,803
Battens (Fir)	,,	2,255,876	1,240.190	1,871.899
Pine	,,	596.825	498,613	421.276
Spruce	,,	883.158	687,709	1,181,476

* The Pitch-Pine import excludes any delivered overside.

RATIO OF IMPORT TO CONSUMPTION (DOCK AND OVERSIDE) IN THE FOLLOWING YEARS.

	1913. Per Cent.	1914. Per Cent.	1915. Per Cent.
Deals (Fir)	106	89	92
Battens (Fir)	98	89	115
Pine	103	99	93
Spruce	121	97	127
Pitch-Pine Planks *(Dock only)*	242	56	50
Deals and Battens in aggregate	103	90	110
Rough Boards	117	92	102
Planed Boards	93	100	97
Floated Timber	134	99	41

The trade as far as hardwoods are concerned is of less interest to the building industry, but we may mention that the decrease in the year's imports of mahogany amounted to 73 per cent. as compared with 1914, and the imports of other hardwoods used in cabinet-making and decorative work showed similar reductions. Teak imports, on the other hand, only fell off some 10 per cent. as compared with those of the previous year.

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Aberdeen.—The T.C. has approved plans of two dwelling-houses, each for two tenants, one dwelling-house for four tenants, and additions to engineering works and comb works.

Abergavenny.—At a recent meeting of the B.G. the Clerk suggested that the Guardians should take steps towards the appointment of an architect for the proposed new workhouse, and it was decided to ask the opinion of the L.G.B. on the matter.

Aldershot.—Plans passed by the D.C.:—Alterations and additions, 22, Station-road, Mr. John Eighteen; reconstruction of premises, Redan-hill, Messrs. R. Bateman & Sons.

Barrow.—The T.C. has approved of an application received from the Salvation Army authorities in connection with a proposed enlargement of the Salvation Army War Workers' Hostel. The T.C. has approved a perspective elevation of the Labour Exchange Building, Duke-street, submitted by H.M. Office of Works.

Bath.—The War Office has been requested to erect the building required for the sub-station at the Bath War Hospital.

Bletchley.—The U.D.C. has passed plans for a garage in High-street for Mr. Jacobs.

Bournemouth.—Plans passed by the B.C.:—Additions, Capital and Counties Bank, Old Christchurch-road, the Capital and Counties Banking Company; additions, 402 and 404, Holdenhurst-road, the Parkstone and Bournemouth Co-operative Society; alterations, "The Dunes," Southern-road, the Rev. C. W. Lloyd Evans; alterations, "Morningside," Bay View-road, Mr. G. Grant; alterations to stables, Castle Laundry, Castle-road, Mr. R. Bevington; alterations to stables, rear of "Aysgarth," Poole-road, Mr. C. Williams; amended plan of house, site 43, Montagu-road, Mr. H. B. Mudge; covering for vans, etc., Victoria-road, Mr. C. W. Powell; motor house, site 215, Dunbar-road, Messrs. Jones & Seward; additions to garage, Nos. 1 and 3, Parker-road, Mr. T. Dean; alterations, "Albany Hotel," Holdenhurst-road, Mr. F. J. Hall; additions, Grosvenor garage, Poole-hill, the Grosvenor Garage Company; amended plan of house, plot 180, Keswick-road, Mr. R. Collins; bungalow, plot 4, Watcombe-road, Mr. W. Chadwick; motor house, etc., plot 19, Wentworth-avenue, Mr. J. Newbury; house, Cecil-avenue, Mr. H. V. Eastwell; garage, plot 51, Wentworth-avenue, Messrs. Burridge & Bovil; house, stabling, corner East-avenue and Berwick-road, Mr. J. Kingham; house, plot 73, Chessel-avenue, Mr. J. S. Brown.

Bromsgrove.—The L.G.B. has finally approved the Rubery town-planning scheme promoted by the North Bromsgrove U.D.C.

Burton-on-Trent.—At a recent meeting of the T.C. it was announced that an important firm had purchased a site of 50 acres of land at Horninglow, for the establishment of works, and that building operations would shortly commence.

Calcutta.—We learn that work is to be started almost immediately with the building of the hospital for tropical diseases, which is to form an annexe to the School of Tropical Medicine in Calcutta.

Cardiff.—The hospital authorities announce an anonymous gift of £10,500 to King Edward's Hospital, Cardiff, towards the cost of new extensions.

---

* See also our list of Competitions, Contracts, etc., on page 78.

Colombia.—The *Diario Oficial* (Bogotá) of November 10 last publishes a law empowering the "Junta Central de Higiene" to undertake the construction of a sanitary station in the port of Buenaventura similar to the existing station at Santa Marta. The same law also allots the sum of 10,000 pesos gold (£2,000) for the completion of sanitary buildings, for the bacteriological laboratory, and for the construction of a wharf at the sanitary station of Santa Marta.

Cupar.—The heritors have agreed to execute certain structural and other improvements to the manse at a total cost of about £260. Mr. Charles Storrar, architect, has the work in hand.

Deemount.—The Aberdeen T.C. has had under consideration the proposed erection of a number of houses on the garden colony system at Deemount.

Dewsbury.—Plans passed by the T.C.:—Water tower at Jilling Ing Mills, Earlsheaton, for Messrs. S. Lyles, Sons, & Co., Ltd.; additions to Wire Works, Mill-street East, Savile Town, for Messrs. H. Spencer & Co.

Folkestone.—Plans passed by the T.C.:—Plans submitted by the Hon. Miss F. Daly (owner) (Mr. C. D. Jenner, architect, Mr. C. Jenner, builder) for a temporary recreation-room at Manor House Hospital, Earl's-avenue; plans submitted by Mrs. P. W. Apps (owner) (Mr. G. H. Camburn, architect) for alterations and additions at Pleydell House, Bouverie-road West.

Girvan.—The Burgh Surveyor has submitted a report on the present water works and schemes for the extension of the water supply, with relative plans, etc. The Council has visited the Balceachie district, and inspected the site of the proposed new reservoir, and has also visited Glendoune burn with a view of ascertaining if a supply of water could be got there.

Glasgow.—Glasgow Dean of Guild Court has granted the following linings:—The North British Railway Company, to convert into general offices the building known as the Royal Hotel in George-square; Messrs. William Cooper & Nephews, chemical manufacturers, Lochburn, Maryhill, to erect buildings for offices, workers' block, pump-house, mechanics' shop, laboratory, joiners' shop, etc., at Lochburn; Mr. James Howden's trustees, to erect a boatbuilding shed at 685, South-street, Whiteinch.

Greenock.—The Corporation has decided to erect over a hundred cottage houses for workers at the east end of the town, estimated to cost £35,000.

Hexham.—The U.D.C. has approved a plan submitted by Mr. M. Hall, on behalf of Mr. J. Hutchinson, for a cartshed to be erected at New Court, Priestpopple.

Holmfirth.—The Holmfirth Council is preparing to begin its housing scheme, which provides for building on Newmill-road twelve houses at £250 each and thirty at £230 each.

Huntingdon.—The T.C. is considering plans of the proposed refuse destructor.

Jarrow.—The Palmer Shipbuilding and Iron Company propose to build a quay, 500 ft. long, from the Corporation Quay westwards.

Leyland.—The U.D.C. has passed a plan of proposed boiler-house and chimney for Wood Milnes, Ltd.

Longniddry.—The Scottish Veterans' Garden City Association has accepted the offer of ground at Longniddry as a site for the local Garden City scheme. The consulting architect stated that the first section, which might now be proceeded with, would embrace forty houses and two workshops, and extension could take place later.

Matlock.—The Urban Council has adopted the scheme for providing a water supply to the district of Riber, by means of a windmill, etc.

Mitcham.—The U.D.C. has approved the following plans for new buildings:—Mr. J. Wilson, two dwelling-houses, Ashbourne-road; Mitcham Margarine Company, additions to Woodite Works Factory, Commonside East; Mr. A. L. Lambert, motor garage, 18, Garden-avenue; alterations at Messrs. T. Parsons & Sons.

New Mills.—The Council's seal has been affixed to a plan of proposed new stables for Messrs. R. Wilson & Co. on Buxton-road.

Oldbury.—The U.D.C. has approved of the following building plan:—Mr. W. Dearn, conversion of one house into two, Clay-lane, Langley.

Penmore.—The L.G.B. has now given its sanction to the borrowing by the Derbyshire C.C. of the following amounts in respect of the extension of the Penmore Isolation Hospital:—£4,790 for thirty years for new buildings; £945 for ten years for furniture, fittings, boundary walls, fencing, etc.

Prudhoe.—The plans for the housing scheme, in accordance with the suggestions of the L.G.B., have been approved by the Council.

St. Annes (Lancs).—The question of the erection of a floral hall in the Ashton Gardens is under consideration by the Council.

Sheffield.—Sheffield is suffering from a very real housing famine, caused by the influx of munition workers, and the civic authorities are doing their best to tackle the problem. The City Council has just adopted a scheme for the erection of permanent and temporary homes and hostels at a cost of about £300,000. Over 260 permanent houses are to be built at once on estates owned by the municipality, and temporary houses, hostels, and colony blocks which will accommodate 4,631 workers, at a cost of nearly £200,000.

Skegness.—Plans have now been prepared by Mr. Percy Houfton, of Chesterfield, for the Derbyshire Miners' Convalescent Home at Skegness. A site for the proposed home has been secured at the extreme northern end of Skegness, approached by a short length of road from Roman Bank.

Stonehaven.—Plans for the erection of several semi-detached villas in Victoria-street have been before the T.C.

Swansea.—Another big cinema enterprise is being mooted in Swansea. The building is estimated to cost between £5,000 and £7,000. The site is off High-street.

Ulverston.—The U.D.C. has approved plans of two pairs of semi-detached villas in King's-road.

Watford.—The following plans have been recommended to the U.D.C. for approval:—New shop and premises, next to 116, High-street, for Messrs. Bottom Bros.; temporary chemical factory for the Cooper Laboratory for Economic Research, Rickmansworth-road.

West Hartlepool.—The T.C. has approved the following plan:—Mr. W. Kirby, motor garage, Stockton-road and Blakelock-road, as a temporary building. The T.C. has received a notification from the North-Eastern Railway Company, with plan, of their intention to improve the Burn-road sidings. Plan and estimate for the construction of Back Percy-street and Bellerby-terrace and Ashley-gardens have been approved by the T.C.

Wick.—Wick Harbour Trust has received intimation that the Commissioners of the Treasury have recommended an advance from the Development Fund to the Trustees of a sum not exceeding £31,260 for the execution of works. The specified works include the preservation of the existing works, and particularly the repair of the south quay and the restoration of the damaged north side of the river.

Woolwich.—The justices have given consent to alterations in respect of the Royal Ordnance Arms beerhouse, Ordnance-road, Woolwich, and the Fox-under-the-Hill, Shooter's Hill-road.

GENERAL BUILDING NEWS.

CHURCH, STONEYCROFT.

The new church of St. Paul, Stoneycroft, has recently been consecrated by the Lord Bishop of Liverpool. The church has been erected on a site at the corner of Derby-lane and Derwent-road. The first stone of the old St. Paul's Church was laid on April 4, 1763. The new St. Paul's Church has been designed by Mr. Gilbert Scott, the architect of the Liverpool Cathedral. The building is of grey brick, specially made at Ruabon for this work, and is roofed with red tiles. The walls are plastered, with brick drawings, and there is a panelling of wood all round. The aisles are laid in grey and white tiles, and the seating consists of rush-bottomed chairs arranged on a flooring of wooden blocks.

GOLF CLUBHOUSE, FURNESS.

The new club house which has been erected for the Furness Golf Club has recently been opened. The building is situated on a site overlooking the Irish Sea, at the junction of Moor Tarn-lane and the new road at present being made from the end of Walney Bridge. On the ground floor there is a spacious hall, from which open the following rooms:—Gentlemen's locker-room, smoking-room, lavatory, secretary's office, ladies' locker-room, ladies' private room, and ladies' lavatory. On the first floor is situated an upper hall, from which opens a large luncheon-room. The club-kitchen, pantry, and caretaker's house are also situated on this floor, and a large balcony opens out from the luncheon-room. The building, which is heated throughout by a hot-water system, is built of brick and rough-casted. The contractors for the whole of the building are Messrs. Rainey Brothers, and for the furnishings, Messrs. Hampton & Sons, London; the architect being Mr. Arthur H. Taylor, Walney.

TRADE NEWS.

Under the direction of Messrs. Hyams & Hobgen, architects, Paignton, Boyle's latest patent "air-pump" ventilator has been applied to Deller's New Café, Exeter.

We hear that the Board of Public Works have been making extensions to the G.P.O., Dublin, and that the powder "Pudlo" has been used for making some of the cement watertight.

The premises of the Publisher's Waste Company, Manchester, are being warmed by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

NEW COMPANIES.

THE undermentioned particulars of new companies recently registered are taken from the Daily Register compiled by Messrs. Jordan & Sons, Ltd., Company Registration Agents, Chancery-lane, W.C.

H. & J. MATTHEWS, LTD. (142,552), Castle-street, Berkhamsted, Hertford. Registered December 29. To acquire, take over, and to carry on the business now carried on by H. & J. Matthews as H. & J. Matthews at Berkhamsted, Hertford, and to carry on business of contractors joiners, builders, wheelwrights, smiths, hot water engineers, coal merchants, brick makers, and stone merchants, electrical engineers, etc. Nominal capital, £5,000 in 5,000 £1 Ordinary shares.

THOMAS SMITH & SON, LTD. (142,587). Registered December 31. To carry on busines of manufacturers of oil-colour paint, whitelead, enamel, and varnish, colour grinders, timber lime, and cement merchants, gas, electrical, mechanical, and sanitary engineers, builders, shippers, wharfingers, warehousemen, etc Nominal capital, £25,000 in 2,500 £10 shares.

C. A. VANDERVELL & CO., LTD. (142,593) Warple Way, Acton Vale. Registered January 1. To carry on business of electrica engineers, manufacturers of dynamos, lighting equipments, accumulators and other moto accessories, and Government contractors, now carried on by C. A. Vandervell at above address and to carry on business of iron and stee converters, builders, etc. Nominal capital £350,000 in 300,000 £1 ordinary shares, and 1,000,000 1s. deferred shares.

COLLINSON & CO., LTD. (142,604), 56, Walpole road, Teddington. Registered January 3. T carry on business of builders, decorators, worker in and manufacturers of machinery of al kinds, tools, iron, steel, and other metals contractors, dealers in stone, lime, sand bricks, and other building requisites, electrica engineers, dealers in motor-cars, etc. Nomina capital, £2,500 in 2,500 £1 ordinary shares.

ISAAC WARD, LTD. (142,607), Progres Works, Byrern-street, Blackburn. Registere January 3. To acquire from S. Ward, c Blackburn, and carry on business now carrie on by him at Blackburn, as Isaac Ward, busines of general mill furnishers, manufacturers c appliances and plant in connection therewith ironmongers, engineers, brass and iron founders builders, plumbers, gasfitters, and lightin engineers, designers, etc. Nominal capita £1,000 in 1,000 £1 shares.

J. F. GOODWILLIE, LTD. (142,628 Registered January 5. To acquire and tak over business of timber merchant and coope carried on by S. H. Goodwillie at St. Matthew Wharf and Mount Pleasant, and 40, North street, Gosport, Hants, as J. F. Goodwillie, an to carry on business of builders, contractor painters, manufacturers of bricks, tiles, pottery earthenware, terra-cotta, china, etc. Nomina capital, £5,000 in 5,000 £1 ordinary shares.

HENRY ALLEN, LTD. (142,638), 101, Amhurs road, Hackney, N.E. Registered January To carry on business of cartage contractor builders, builders' merchants, excavator dealers in agricultural and horticultural requir ments, produce and horses. Nominal capita £5,000 in 5,000 £1 shares.

SIR JOHN GUNN & CO., LTD. (142,640 Registered January 6. To carry on trade coal, coke, and fuel exporters and merchant factories and colliery owners, quarrymen, an brickmakers, builders, dealers in ships, barge and craft of all kinds, insurers, carriers, et Nominal capital, £50,000 in 500 £100 shares.

J. LORD, LTD. (142,650), 40, St. Peter's-gat Stockport. Registered January 7. To car on business of furnace makers and deale makers of materials required in said busine iron founders, mechanical engineers, toolmake brass founders, builders, painters, etc. Nomir capital, £2,000 in 2,000 £1 shares.

ROWELL, LTD. (142,653), Woodsic Wrekenton, Gateshead, Durham. Register January 7. To carry on business of proper owners, builders and contractors, house a estate agents, and any other trade in connecti therewith. Nominal capital, £5,000 in 3 £10 ordinary shares and 300 £5 preference shar

FOREIGN AND COLONIAL.

Catalogues and Price Lists of British Goods for China.

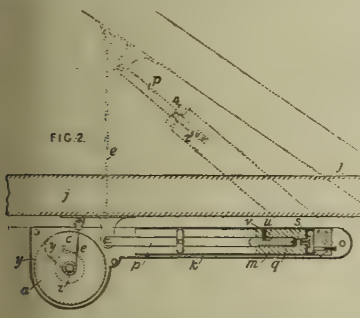
H.M. Commercial Attaché at Peking (Mr. V. P. Ker, C.M.G.) reports that the Chinese Ministry of Agriculture and Commerce have ecently established a Commercial and Industrial 'ommission whose object is the collection of tatistics and the development of trade in China, nd that this Commission desires to receive opies of catalogues issued by United Kingdom nanufacturers. United Kingdom manufacurers and exporters of United Kingdom goods who may be interested should address atalogues and price lists of their goods to he Commercial and Industrial Commission, Ministry of Agriculture and Commerce, Peking.

◆

SELECTED PATENTS.

17,376 of 1914.—Percy Alliott Smithurst: Door springs and checks.

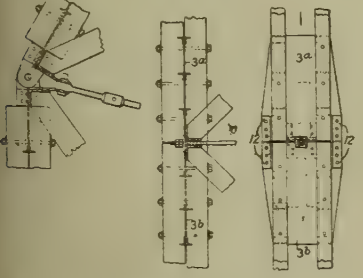
This relates to a combined spring doorcloser and piston check, in which the spring lrum *a* is provided with a groove *y*, either in he form of a fusee or a cylindrical helix, and n which the cord *e* attached to the door *j* s wound, the groove having a sudden cutoff so that extra force is applied to overcome he resistance of the latch. The groove *y* eaves the surface of the drum at y^1, and the ord *e* then winds on a drum *z* of smaller iameter. The piston *m* operates in a pivoted ylinder *k*, and has a lost-motion connection *v*, with the piston-rod *p*, so that air can enter e cylinder through the slot *q* and the passage when the piston is moving out. A blade ring 2 may be provided on the cylinder to ngage an adjustable disc 4 on the piston-rod hold the door open. The cord may be etached from the door so that the check lone is in operation.



17,376 of 1914.

17,395 of 1914.—Ballonhallenbauges: Girders.

This relates to a bar connection for trussed lattice-work of the Howe type, applicable hangar girders and framework, consisting a pair of metal plates 3^a, 3^b, or a single plate ranged at the centre of gravity of the compund chord or boom and transversely to the ane of the girder. The two plates are nnected by fish-plates 12, and the diagonals d verticals are so connected that the forces ting at the joint are concurrent. The fishates may be bent for angle joints, or hinged r hinged joints.



17,395 of 1914.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the present rates of wages in the Building Trade in the principal towns of England and Wales. It must be understood that, while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur:—

—	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Masons' Labourers.	Bricklayers' Labourers.	Plasterers' Labourers.

THE SOCIETY OF ARCHITECTS.

We take the following from the Report of the Council of the Society of Architects for the year ended October 31, 1915. The Report was adopted at the annual general meeting on the 13th inst.:—

The Thirty-first Annual Report of the Council covers a period of twelve months, during which time the first consideration of most people has been the call and response to active service of some kind tending to the successful prosecution of the war against the common enemy. Matters of personal and professional interest have taken for the time being a secondary place, but they have demanded from this very fact an even more anxious and careful attention than might be called for under normal circumstances. At the last annual general meeting the view was expressed by a representative of the general body of members that the Society must be prepared for a less favourable Report on the next occasion. The Council trusts that the members will agree, after a perusal of the Report, that, while all the departments of the Society's work have been affected by the war, its position both numerically and financially has been not merely maintained, but more firmly established. This has been effected by a policy of economy which, while not interfering with the essential activities of the Society, has enabled the Council to conserve the individual interests of members, especially of those more seriously affected by the war than others, to consolidate the Society's resources, and to make what provision is humanly possible for future contingencies.

Twenty-one candidates have been elected to membership by ballot of the members, and one candidate and six students have been admitted to the respective registers by the Council. After allowing for deaths, resignations, lapses, removals, and transfers, the total membership on October 31 was 1,213, made up as shown. Last year's figures are given for comparison:—

	1915.	1914.
Honorary members ..	30	29
Retired members	25	23
Members	1,003	1,014
Graduates	7	7
Students	148	155
Total ..	1,213	1,228

Professional Practice. Attendances on Subcontractors.—As stated in the last Report, the Council was then in negotiation with the Surveyors' Institution on the question of the definition of the term "attendance," the proposal being that the subcontractor shall know precisely what services must be performed by him and rendered to him. The Council, after careful consideration of the memorandum, was able to approve in principle the recommendations of the Surveyors' Institution, but made some suggestions for alterations in detail. These related more particularly to descriptive items which it was thought might with advantage be summarised in the case of small contracts and set out fully in works of more importance. The Council also suggested an additional clause relating to the use of scaffolding. After further negotiations the Surveyors' Institution intimated that the suggestions made by the Society would be adopted when reissuing the circular on attendances on subcontractors. Full details relating to the matter were published in the March issue of the Society's *Journal*.

The Board of Agriculture and Fisheries, and Rural Cottages.—The attention of the Council was called on a question of principle to the issue by the Board of a Report containing designs, specifications, and working drawings of cottages, which document could be purchased for a nominal sum. In the Report there was no definite reference to the desirability of retaining an architect's services in order more fully to attain the object which the Advisory Committee had in view. The Council felt that the omission would tend to accentuate the feeling already existing among some private and public building owners that the services of an architect were superfluous in connection with work of this kind. It, therefore, entered a strong protest on the point to the Board. The Board's reply did not cause the Council to withdraw its observations or to change its opinion that an injustice had been done to the architectural profession by the publication of the Report in that form by a Government Department. The Council subsequently sent copies of the correspondence between the parties to the architectural Press and printed it in the Society's *Journal*, so that those concerned might draw their own conclusions. The majority of those who expressed their views on the subject upheld the action of the Society.

Professional Defence.—The services of the Advisory Committee were called in to consider whether a case submitted by a member involving an alleged infringement of copyright in a design was of such a character as would justify the Society in co-operating with the member in bringing an action to decide the point in the interests of the profession. The case was gone into very fully in all its bearings, and the findings of the Committee were placed at the disposal of the member concerned for his guidance.

The Practice Committee has been called upon frequently to advise members on points of practice, and from the acknowledgments received from the recipients it would seem that the assistance which has been rendered to them has been appreciated. The Committee has also had before it points relating to matters of professional etiquette. The questions raised have shown the desirability of strengthening the disciplinary powers of the Council, and a proposal to this end will presently be placed before the members by way of a proposed alteration to the Articles of Association. At the same time opportunity will be taken to suggest further revisions in other ways also, more particularly in the direction of a reconstitution of the Council so as to give a more definite proportional representation of country members thereon, and to secure more continuity of service than is possible under the present regulations.

Standard Documents.—The model form of conditions of building contract in the drafting of which the Council had the assistance of Mr. W. Valentine Ball, barrister-at-law, was the subject of discussion at a members' meeting in May. Since then other suggestions for revisions have been received from members, and the Council hopes it may be possible during the new session to report further progress. There are, however, questions of policy as well as of detail which require careful consideration, and some time must necessarily elapse before a definite announcement can be made.

In the meantime the Council has drawn up a number of forms for use under the London Building Act. They comprise the following:—

(1) Party Structure Notice.

(2) Party Fence Wall Notice.

(3) Party Wall Notice where adjoining lands are unbuilt on at the line of junction.

(4) External Wall Notice where projecting footings on adjoining lands are intended.

(5) Notice of intention to build within 10 ft. of and at a lower level than the foundations of an adjoining building.

(6) Counter Notice by Adjoining Owner who has been served with notice of intention to build within 10 ft. of and at a lower level than the foundations of his building.

(7) Notice to appoint a Surveyor.

(8) Notice to appoint a new Surveyor.

(9) Appointment of Surveyor on Default.

(10) Appointment of Third Surveyor.

(11) Notice Requiring Arbitration on a disputed dangerous Structure Notice and appointment of Owner's Surveyor.

(12) Appointment of a Third Surveyor as Arbitrator on a disputed Dangerous Structure Notice.

(13) Notice Requiring Arbitration on a disputed Dangerous Structure Notice and appointment of Owner's Surveyor.

(14) Appointment of a Third Surveyor as Arbitrator on a disputed Dangerous Structure Notice.

The Society's Parliamentary propaganda in this direction has been suspended during the war. The need of Registration in the interest of all concerned becomes more evident every day. The war itself has provided an object-lesson in the attitude of the Government
towards the profession as a body in placing
other hands very much work in connection wi
war contracts which might well have be
allotted to architects, even if only as son
compensation for its action—no doubt a ve
necessary one at the moment from the Gover
ment point of view of discouraging pub
and private expenditure on building operation
Until architects have a legal status, and a
properly organised, they cannot expect
receive as a body that recognition which oth
protected professions can claim. The effo
of architectural bodies in other parts of t
Empire are all in the direction of statuto
Registration, and in several of the Dominio
success has been attained, and in others t
question of Registration is still being debate
with a view to further action at an early dat

In South Africa the Society's branch
actively supporting a proposal for the extensi
of the Transvaal Architects' Act to the Uni
of South Africa, and has undertaken to gi
the Cape Institute of Architects not o
moral but substantial financial support
this end. It is stated that in Queensland th
is a Registration Bill under consideration
the Cabinet, and that the Royal Victori
Institute of Architects are pushing forward w
a Bill based on the lines of the Transv
Architects' Act. Similar steps are being tak
in Tasmania and South Australia, and Regist
-tion is understood to be in force in New Yo
Michigan, and Florida. These centres are
addition to others which have already secu
Registration. The list is incomplete, but
serves to show how the principle for which
Society has contended for so long and is s
contending is becoming increasingly recogni
by other architectural institutions, and
those sections of communities having deali
with architects.

The Council, at the commencement of
session, renewed its permission for the Bea
Arts Committee to use the Society's prem
for its meetings, and the services of the Secret
and of the clerical staff for carrying on
business.

The war has affected the influx of
members into the Atelier, but the work
been continued on the same lines as bef
although under somewhat different conditi
The Sous Patron, M. Chaurès, who has b
with the Army of France since the outbrea
war, has been seriously wounded. All
eligible members of the Atelier have enliste
obtained commissions, and several of the m
promising of them have been killed in actio

Members who have read the *Journal*
have noted how the movement initiated by
Beaux-Arts Committee at home, with
assistance of the Society, has borne fruit in
creation of a similar movement in New Zeal
and in the suggestion of educational work
these lines in South Africa. It is interes
to recall how the proposal, when first g
practical effect to by the Society of Archit
was received with coldness by some who
since become converted to the views of
Beaux-Arts Committee.

The Society is represented on the Archit
War Committee and its subsidiary commit
one of the most important of which is

body carries on its work at the Society's prem
with the aid of the Secretary and the cle
staff. The work of this Committee has
greatly developed during the past year.

The scheme of civic surveys, initiated
Mr. Lanchester, a member of the Commi
has received Government sanction and sup
and is now a separate department.
Council offered the promoters the use of
Society's premises for the survey work,
it was evident that the requirements w
include accommodation for a staff of drau
men and investigators, which it was be
the Society's present power to house.
work is being carried on at the R.I.B.A. Gall
and the provincial centres have been
established. Some of the work connected
this still falls upon the Professional Employ
Committee, but its chief work is in dealing
developments of the Society's original pro
for finding temporary paid work for arch
in distress owing to the war. This u
takes the form of measured drawing
descriptive reports on many and varied sul

and is distinct from the Government Civic Survey work. It may be remembered that, as an earnest of its desire to support the scheme for providing paid professional work, the Society made a donation of 100 guineas as the nucleus of a fund. The members of the Society have since augmented this to a total of £175 10s. 3d.

BOOK REVIEW.

Levelling and its General Application. By THOMAS HOLLOWAY. Revised by H. T. TALLACK. (London: E. & F. N. Spon, Ltd. Price 2s. 6d. net.)

THIS is the third edition of an excellent little book dealing with the art of levelling in a simple manner, which renders it eminently suitable for the uninitiated, and it can be recommended to architects' and engineers' pupils and assistants who are commencing their studies. The general principles of levelling are first explained and the various instruments described, and from these the reader is taken to the actual process of taking levels under different conditions.

Examples are fully illustrated, together with explanations for the use of the field book, and hints as to procedure are given for the beginner. A chapter is devoted to the use of the theodolite and another to town levelling, while other sections of the book describe special cases such as the crossing of a river.

A series of examination papers are attached at the end of the book for the use of the student.

It is quite impossible to learn levelling entirely from the study of books, as actual field lessons are absolutely essential to the beginner in order that he may understand the instruments and their adjustments; but a good groundwork can be obtained which will be of value when on the field for the first time or two, and we consider that this book will prove to be of great assistance for this purpose.

LAW REPORTS.

Thermit Process of Welding Tramlines and Building Girders.

THE Thermit process for the welding of tramlines and building girders was the subject of an application in the Patents Court recently.

A twelvemonth since, Messrs. Blackwell & Turner applied for, and were given, the title to use the two foundation patents of this process, which belongs to Thermit, Ltd., of 27, Martin's-lane, E.C., and they now asked under their new name of the British Thermit Company, Ltd., of 49 and 51, The Albany, Liverpool, for licence to use eight other patents relating to the same process, all belonging to Thermit, Ltd. The two patents already obtained were Nos. 10,859 of 1901 and 24,439 of 1902. The eight patents of the present application were Nos. 25,297 of 1904, 21,750 of 1909, 24,389 of 1910, 19,473 of 1911, 16,165 of 1912, 218 of 1913, 1,179 of 1913, and 26,180 of 1913.

For the applicants, Mr. E. R. Royston, Liverpool, said the substantial shareholding in Thermit, Ltd., was German, and the company was now being worked under a controller, and was supplying munitions to the Government. The applicants' alteration of name had had the approval of the Board of Trade, and the applicants were themselves doing a great deal of work for the Minister of Munitions. Thermit *per se* anybody might now use, but the processes covered by the eight patents were essential for right welding in the laying of tramlines and the erection of building girders. Various thermit compounds were used in the reheating of molten steel and iron, and the applicants, he submitted, ought not to be placed in any worse position, for the employment of this alumina-thermic method, than the respondent firms. Thermit, Ltd., were opposing. Mr. Blackwell, he should add, had experimented in the matter, and had used thermit for reducing metals and in obtaining tremendous heat for metals which moulded with difficulty, and for forming alloys. Tramway Corporations in the North of England and elsewhere were anxious that the applicants should be placed in a position to give them the full benefit of these processes. Of course the opponents were keen competitors, doing all they could to keep hold of this business to the last. It would be monstrous, however, for the applicants to be placed in a less satisfactory position for trading than Thermit, Ltd., especially in view of the German shareholding in that company. The patents applied for included clamping by screw force while welding was going on, fusing or welding the rails *in situ*, and an apparatus for securing accurate alignment and regular curves. The applicants needed these patents for authorities which were laying down rails both in this country and abroad.

Mr. Colefax, K.C., for the opponents, insisted that this was a general and promiscuous application for patents. One of the patents asked for had never been used in this country at all! Had Thermit, Ltd., possessed fifty patents they might all have been demanded in this cheerful way. As it was, the applicants had pretty well roped in all they had. He supposed the doctrine on which they acted was, "The more the merrier." The respondents were a registered British company using all these processes themselves, it was important to remember, and they were now under Government direction.

The Controller of Patents (Mr. Temple Franks, with whom sat the Deputy-Controller, Sir Cornelius Dalton) said he was sorry that what he had so often seen before had happened in this case. The British manufacturer, though he had the whole thing in his hands at one time, had left it alone and left it to the Germans to take the thing up and develop the process. He let, say, fifteen years go by, and then exclaimed, "What a deplorable thing it is that these Germans should be running this process!" That had happened with company after company in things the most important for the commerce of this country. The German company were perfectly right if the others were such fools as to allow them to do it. And they had been fools.

Mr. Colefax suggested that the Patents Court had been proceeding on the wrong line in its reading of the law in respect to the patents of alien enemies. The rules by which it had to work were not designed to give these patents into other hands if they were being satisfactorily worked for the good of this country. The rules had been misread. All that was required was that this country should not be left without its supply. Thermit, Ltd., had not only the ability and readiness to supply, but an experience and efficiency which rendered them more acceptable to British corporations. And they were under Government control.

The Controller of Patents: It will take a good deal to convince me that it is not to the general interest of the community or of trading generally that some independent English company should be sellers of a material of such great commercial uses as this. I certainly think they have made out a good *primâ facie* case.

Mr. William Lawrence Turner, managing director of the British Thermit Company, Ltd., said they were prepared to pay a royalty of 6d. per joint where any of the patent processes were used, and he supposed a corporation would pay roughly a sovereign for the thermit for each joint and another sovereign for the mechanical appliance. The applicants would effect perhaps three joints a night, or a thousand a year. But without the patents it was practically impossible for them to do any more than sell the thermit. Thermit, or a mixture of aluminium and oxide of iron, anybody might supply. The British Thermit Company would employ all the usual powders used in welding. They had different grades at their works at Garston for different purposes to suit all conditions of welding.

The Controller observed that he wished that the corporations, when they were not satisfied with any work, would come to the Court and complain.

Mr. Colefax answered that they would not do that, because they had always been satisfied with Thermit, Ltd.'s use of its own patents.

The Controller: My feeling is that, if one can secure the trade in this country, there ought not to be a monopoly of a purely German company doing for us highly important work of this character.

Mr. Colefax said he should have to submit (a) that the needs of the country were already satisfied; (b) that there was no chance of the suspension of the source of supply, or the agency through which the need of the public was met; and (c) that the applicants could not do the work, the process being largely a secret one.

Mr. Turner answered that ordinary workmen had carried it out on the Liverpool tramways, and it had been open to observation. The applicants knew what they were about.

Evidence as to the present position of Thermit, Ltd., was given by its Controller, appointed at the instance of the Board of Trade and the War Office—Mr. Arthur Taylor, of the firm of Messrs. Hudson, Smith, Briggs, Smith, & Taylor, chartered accountants, of Thames House, Queen-street-place, E.C. The respondent firm, he said, was registered at Somerset House. Mr. Stultz, in 1914, was appointed as committee of one to take control, but since his (the witness's) appointment additional plant had been set up, and the staff and the material used were now all British. Eighty per cent. of the firm's productions at the present time had relation to munitions.

Mr. John Baillie Hamilton, general manager of the Leeds City tramways, said he would prefer that Thermit, Ltd., supplied him. The Corporation did their own welding. To make a buffer joint required considerable skill on the part of the operators, as well as proper materials and appliances. The applicants' joints under test at Leeds had not stood the same strain as the respondents'.

The Controller said the Board of Trade would communicate with the British Thermit Company. He took a note of an alternative suggestion for royalty by Mr. Royston of 5 per cent. on the patent process, not the thermit, used.

Counsel on the other side said the amount should be half-a-crown a joint.

A Piecemeal Contract.

IN the Marylebone County Court, on January 6, before his Honour Sir W. Lucius Selfe, Mr. Robert Thomas Inman, builder, 22, Brindley-street, Harrow-road, claimed £14 11s. 1d., balance of an account for work and materials, from Mrs. Tremain, of 133, Sutherland-avenue, Maida Vale. The facts, according to the plaintiff's evidence, were that the defendant in March, 1914, asked him for an estimate for the repair and internal decoration of her house, commencing at the top flat. He named a figure, and that being accepted he was told to start the job. Next he was taken to the basement and the same formula observed, and next the dining-room floor. When this was completed, he inquired about the hall and main staircase, but was told that another firm had that job.

His Honour: I see you charge various rates for wallpapers?

Plaintiff: The bargain was that I was to be allowed 1s. per piece for papers, and the defendant was to choose them; if the price was over 1s. a piece she was to pay the difference as an extra.

Mr. Morris (to the plaintiff): About these glazed tiles for the kitchen?

Plaintiff: There was a certain surface of tiling estimated for, but as I had a larger quantity of tiles there than was required I was asked to leave them, and I did.

Mr. Clay (for the defendant): You have charged £3 extra for the cornice of the dining-room?

Plaintiff: The cornice was knocked down by the gasmen who came to fix stoves in every room of the house, and had to be put up again.

Mr. Clay: About the price of the paper; how was that fixed?

Plaintiff: Defendant chose the papers. You can get them from 2d. to 10s. a piece.

His Honour: That's a jump!

Generally, plaintiff said, the defendant had agreed to his prices before he started any section of the work. Defendant said that she had agreed to pay for wallpapers up to a certain price, and those used were above her figure. The £2 charged for pulling down the sink walls was a distinct overcharge, as the water came through the dining-room ceiling and loosened the cornice. For putting this up plaintiff had charged £8, and Messrs. Henwood & Roberts had replaced it for £4 6s. She gave no instructions to replace the attic floor, and knew nothing about that work being undertaken till it was finished. As to the gas, pipes were in position all through the house, and what the gasmen did had no effect on the dining-room cornice. When this accident occurred she became suspicious of plaintiff's work, and entrusted the hall and staircase to Messrs. Henwood & Roberts, who charged her £4 6s. for work for which the plaintiff had been paid £8. He had also charged her £35 for work for which she paid £14 ten years ago. In consequence of these high prices she claimed 5 per cent. deduction from the account, and produced cheques showing that plaintiff had been paid £54 of an account for £69 10s. 9d. for the whole of the work done.

His Honour, having gone through the items *seriatim*, said he would allow the 5 per cent. claimed and the £5 cheque not credited, and gave judgment for £8 1s., with costs.

List of Competitions, Contracts, etc.

For some contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, —; Contracts, iv., vi., viii.; Public Appointments, xvi.; Auction Sales, xviii. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Contracts.

BUILDING AND PAINTING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

January 21.—**Wigan.**—Alterations, etc.—For proposed alterations and repairs at the Poor Law Institution, Frog-lane, Wigan, for the Guardians. Particulars of the Master of the Institution, Wigan.

January 22. — **Newark.** — Converting.—For converting premises in Middlegate into a schools clinic, for the Newark Corporation. Particulars and quantities of the Borough Engineer, Town Hall.

January 26. — **Barrow.** — Extensions. — For carrying out certain extensions to the Refuse Destructor buildings, Cavendish-street, for the Corporation. Forms of tender, etc., of the Borough Engineer.

January 26.—**Brentford.**—Alterations, etc.—For certain alterations and repairs to be carried out:—(1) At the Union Offices; (2) at Warkworth House, for the Guardians. Plans and specifications, etc., at the Union Offices, Isleworth. Mr. F. E. Harmsworth, Clerk to the Guardians.

No Date.—**Hartest Green (Suffolk).**—House and Shop.—For the erection of a house and shop at Hartest Green, Suffolk, for Messrs. Crickmore & Savage, grocers and drapers. Plans and specifications can be seen by appointment at Mr. John Honeywood's, Hartest, Bury St. Edmunds.

No Date. — **Lochwinnoch.** — Cottages.—For single or all trades required in the erection of not less than one nor more than three cottages proposed to be erected in connection with Laigh Linthills (Lochwinnoch) small holdings scheme. The Secretary, Board of Agriculture for Scotland, 29, St. Andrew-square, Edinburgh.

FURNITURE, MATERIALS, etc.

January 29. — **Birmingham.** — Builders' Materials.—Supply to the Public Works Committee of builders' materials for one year, ending March 31, 1917. Forms of tender, etc., of the City Surveyor, Council House, Birmingham. Deposit, £1.

January 29.—**Bishop Auckland.**—Builders' Materials.—Supply to the U.D.C. of builders' materials for the year ending March 31, 1917. Forms of tender, etc., of the Surveyor, Town Hall Buildings.

January 29.—**Cardiff.**—Builders' Materials.—Supply to the Llandaff and Dinas Powis R.D.C. of builders' materials. Tender forms of the Surveyor, Mr. James Holden, A.M.Inst.C.E., 20, Park-place, Cardiff.

January 29.—**Surbiton.**—Builders' Materials.—Supply to the U.D.C. of builders' materials for the year ending March 31, 1917. Tender forms of the Surveyor to the Council, Council Offices, Ewell-road, Surbiton.

January 29.—**York.**—Builders' Materials.—Supply to the Corporation of builders' materials during the year ending March 31, 1917. Forms of tender of Mr. F. W. Spurr, City Engineer, Guildhall, York.

January 31.—**Acton.**—Builders' Materials.—Supply to the U.D.C. of builders' materials for the twelve months ending March 31, 1917. Forms of tender, etc., may be seen at the offices upon application to the Surveyor's Department.

February 7.—**Leeds.**—Cement, etc.—Supply during the twelve months ending March 31, 1917, of cement, earthenware drain-pipes, etc., sewer ironwork. Forms of tender, etc., of Mr. W. T. Lancashire, City Engineer, Municipal Buildings, Leeds.

February 7. — **Middlesbrough.** — Builders' Materials.—Supply to the Corporation of builders' materials required from April 1, 1916, to March 31, 1917. Specification, etc., of Mr. S. E. Burgess, M.Inst.C.E., Borough Engineer, Middlesbrough.

February 7. — **Pembroke.** — Builders' Materials.—Supply to the Pembroke U.D.C., County Dublin, of builders' materials during the twelve months ended March 31, 1917. Specification, etc., can be obtained at the Town Hall, Ballsbridge, Co. Dublin.

February 8.—**Deptford.**—Builders' Materials.—Supply to the B.C. of builders' materials for the year ending March 31, 1917. Forms of tender, etc., can be obtained at the Town Hall, New Cross-road, S.E., between ten and four o'clock (Saturdays, ten to twelve).

February 10.—**London.**—Builders' Materials.—Supply to the Bermondsey Guardians of builders' materials for one year, from April 1, 1916, to March 31, 1917. Forms of tender of Mr. E. Pitts Fenton, Clerk to the Guardians, No. 283, Tooley-street, S.E.

February 12. — **Ossett.** — Materials, etc. — Supply to the Corporation of materials, stores, workmen's tools, etc., required in the Highways, Gas, Lighting, Water, Sanitary, and Educational Departments for one year from April 1, 1916, to March 31, 1917. Specifications, etc., at the Borough Surveyor's Office.

No Date.—**Salford.**—Lime.—For the supply of about 500 tons of lime for the purification of gas. Particulars of Mr. William W. Woodward, Engineer, Gas Offices, Bloom-street, Salford.

ENGINEERING, IRON, AND STEEL.

January 31. — **Queensland.** — Bridgework. — For the supply to the Queensland Railway Commissioner of bridgework. Applications to the Agent-General, 409, Strand, W.C. Further particulars may be obtained at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, E.C.

February 14. — **Birkenhead.**—Heating, etc., Plant.—For the supply, delivery, and erection at the Union Institution and Infirmary, Derby-road, Tranmere, Birkenhead, of a complete centralised heating and hot water supply plant, together with mains, connections, and accessories, for the Guardians. Forms of tender, etc., of the Consulting Engineers, Messrs. Sloan & Lloyd Barnes, M.I.Mech.E., 34, Castle-street, Liverpool. Deposit, £2 2s.

February 23.—**Johannesburg.** — Machinery, etc.—The supply or supply and erection of machinery and fittings for proposed public wash-house, Newtown, Johannesburg. Documents and drawing may be seen on application to the Council's agents in London, Messrs. E. W. Carling & Co., St. Dunstan's-buildings, St. Dunstan's-hill, E.C. Deposit of £1 1s. is required for copies.

ROAD, SANITARY, AND WATER WORKS.

January 22.—**Fermoy.**—Well.—For the sinking of a deep well at Ballinahown, Glanworth East E.D., for the Fermoy R.D.C. Specification, etc., can be seen at the office of Mr. Peter O'Neill, Clerk of the Council, Clerk's Office, Fermoy Workhouse.

January 24.—**Wangford.**—Gravel.—Supply to the R.D.C. of 80 tons of fine gravel (taken out to ¾-in. mesh), to be delivered in such quantities as may be required on or before September 30, 1916. Tender forms of Mr. S. W. Rix, Clerk, Beccles.

January 25. — **Birmingham.** — Road Reconstruction.—Reconstruction of a portion of Brookhill-road, Alum Rock, for the Public Works Committee. Drawings, etc., of Mr. Henry E. Stilgoe, M.Inst.C.E., City Engineer and Surveyor, the Council House, Birmingham. Deposit, £2.

January 29.—**Bridgwater.**—Stone.—Supply to the R.D.C. of stone for the roads within the above district for one year from April 1, 1916, to March 31, 1917. Forms of tender, etc., of the Council's Surveyor, Mr. W. H. Cousins, Surveyor's Office, Eastover, Bridgwater, or of Mr. T. M. Reed, Clerk to the Council, Bridgwater.

January 31.—**Beddington and Wallington.**—Tar Spraying.—For the tar spraying only of about 180,000 sq. yds. of the roads within their district, for the U.D.C. Form of tender, etc., of Mr. S. F. R. Carter, A.M.Inst.C.E., Engineer and Surveyor to the Council, Council Offices, Wallington, Surrey.

✱ January 31. — **Southwark.** — Alterations to Sanitary Fittings.—The Southwark Guardians invite tenders for alterations to sanitary fittings.

February 7.—**Northumberland.**—Stone.—Fo supplying, breaking, and carting stone required for the maintenance of the county roads during the year from April 1, 1916, to March 31, 1917 for the C.C. Forms of tender, etc., of the County Surveyor, Moothall, Newcastle-on-Tyne.

February 9. — **Mullingar.**—Sewer, etc.—Fo construction of a sewer and necessary connection thereto, at the Mullingar District Lunati Asylum. Drawings and specifications prepare by Messrs. Doyle & Loughlin, Civil Engineers Church-street, Athlone, can be seen at thei offices, or at the office of Mr. L. Gavin, Residen Medical Superintendent, Boardroom, Mullinga Asylum.

Auction Sale.

✱ January 25.—**City-road, E.C.**—Mr. F. G Bowen will sell by auction, on the premises, th plant, machinery, and stock of a builder an contractor.

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

VOL. CX.—No. 3808. JANUARY 28, 1916.

THE MONUMENTS OF OUR PROVINCIAL TOWNS:

I.—LIVERPOOL—*(continued).*

LEAVING St. John's Gardens and proceeding up London-road, the monument to George III. is seen placed upon an excellent site. London-road branches into two parts here, leaving a triangular space of green in the centre. At the front of this is placed the monument. The base is surrounded by a flower-bed set in a piece of lawn, often in very bad condition, but, at any rate, in existence. Unfortunately it is deemed necessary to place an ugly railing around the whole of this and also to construct the entrance to a public convenience behind. It is much to be deplored that so many of the monuments in different parts of the country are defaced in this manner.

The statue itself, erected in 1810, is of the Greek type which prevailed at the time, with a plain severe pedestal of granite crowned by an echinus mould of large projection. The horse has little action, and the absence of trappings gives it a somewhat bare and cold appearance. The statue of George III. is likewise commonplace. Although the horse is well proportioned to the pedestal, the general impression given is one of smallness of scale, and shows how important it is to have actual bulk when dealing with equestrian groups.

Other old statues, which do not need more than passing comment, are the Huskisson statue outside the Custom House and Hugh Stowell Brown in Myrtle-street.

The former is a bronze statue upon a plain die almost devoid of mouldings. The position of this group is its best feature, and the contrast given by the columns of the portico behind shows how excellent such a placing is, giving distinction to the most commonplace sculpture. Hugh Stowell Brown is a marble statue upon a Hopton Wood stone base. It is a representation of a typical Nonconformist minister of the nineteenth century, arrayed in a frock-coat and treated in a manner quite devoid of interest or spirit. The sculptor was F. S. Williamson and the date 1889.

Next might be considered the monument to Nelson by Westmacott on Exchange flags. The base of this group is a really excellent piece of composition, the fine swing of the circle below being steadied by the grouping of the four chained slaves of the centre part and the rich bronze bas-relief panels between. The design has all the attraction of originality, and the interest is well maintained by the detail of the sculpture upon the lower part. Even the inscription adds to the richness of the whole. The lettering of the famous Admiral's command can be seen around the top, and seems designed in beautiful sympathy with the general scheme. The only element of weakness is perhaps the allegorical group of the death and translation of Nelson. Falling figures such as this are always unsatisfactory, but, although the problem of creating a group to crown so large a mass was not easy of solution, it should not have been insurmountable. Altogether this monument possesses a degree of vigour and interest quite unexpected and unusual for this period, and should be accorded high appreciation.

If previously any man has contented himself with the assurance that English sculpture and monumental design have been steadily improving for the last fifty years, he should walk from this monument about one hundred yards down the thoroughfare immediately opposite to the Queen Victoria Memorial in Lord-street. This is a scheme for any feature of which it is difficult to find a word of praise. A high steep flight of steps leads up from the island paving to a platform from which rises a canopy upon four groups of Ionic columns. Beneath this canopy is placed the figure of Queen Victoria, standing. The steps are divided into four sections by means of curved balustrades and walls, with a bronze group in the centre of each. The whole of the architectural portion of the scheme is bad. The steps look heavy and uncomfortable, the vases which crown the balustrade are most unshapely, and the whole of the canopy can be brought under the same ban. If, as is sometimes the case, this were relieved by really good modelling, some pleasure at least could have been gained from its contemplation, but the modelling is unfortunately very little above the level of the architecture. The Queen looks a coarse, heavy figure, totally devoid of majesty or regal suggestion. The symbolic groups—there is nothing, by the way, to say of what they are symbolic—are certainly better, but even they are not upon a high level. The best is illustrated in the photograph.

This monument is the more to be regretted because the site is more than reasonably good for an old city already fully built upon. It is in the centre of the town in a wide open space, the roads upon two sides rising towards it at a steep gradient, giving it the immense advantage of a commanding situation. Nor has money been stinted, for, although it has so many faults, parsimony is not one of them. Not only is there much work above ground, but a large and weighty structure such as this requires an expensive foundation, and in Liverpool, although a great deal is rock, the foundation is not always of the best. Altogether the Queen Victoria Memorial as a work of art, an example of modern sculpture, is most deplorable.

It is a pleasure to turn from this to Sir George Frampton's very beautiful little group erected to the memory of Sir Alfred Lewis Jones, and erected facing the River Mersey. No doubt there was adequate reason, but it seems somewhat curious that the site—which is a small open space laid out with grass plots—should have the portion allotted to the statue upon one side. The lay-out seems hardly large enough to contemplate the erection of three monuments, and, if that were so, the centre one, to form them into a scheme, ought to be large enough to dominate the other two. Another monument the size of this, and a much larger group, all in the compass of a hundred yards or a little more, is practically an impossibility. As the scheme stands at present the placing has a most one-sided appearance. The monument itself, however, is quite an excellent piece of design, particularly in respect to the way in which the bronzework is connected to the masonry. The quasi-Gothic feeling of the crowning figure is very characteristic of the sculptor, and is here also in good relation to the type of architecture adopted. The detail of all three figures is extremely interesting, and they portray very well the subjects they are intended to represent. The near figure is called " Research " and the far one " Fruits of Industry." The crowning figure represents " Enterprise," and there is a ship at the back which may be coupled with this in its interpretation.

Sefton Park is famed as one of the fine open spaces of the Liverpool people, and in it has been found a site for a monument to William Rathbone. In the centre of the park there is a large lake, long rather than broad in shape, and winding in its length. Near the centre of this is a large promontory of land rising steeply from the water to a considerable height. Upon this promontory is placed the statue. From the waterside a

NATIONALITY AND ARCHITECTURE.

EMERSON says of art that "it is Nature passed through the alembic of man." It is varied according to the nationality and temperament of the artist; he assimilates most readily those phases of nature which are most in accordance with his own idiosyncrasy, so that art is as varied as the different temperaments of the artists, and this assimilation or selection is not wholly due to intellectual effort, but is, in part, involuntary. The variation in art due to the differing personalities of the artists is naturally more readily to be seen in the imitative arts of painting and sculpture than they are in the ideal and more impersonal art of architecture; but even in architecture they are, as a rule, plainly visible. If we examine the architecture of any period of the past we shall find that the social, political, and physical agencies seem always exactly in accord with the æsthetic feeling and power of the artists of the time, and even with the materials in which they worked. It is the extraordinary harmony that exists between the history of men and the history of stones that causes architectural remains to be of such supreme importance to us in our study of ancient civilisations, as they express the qualities of mind that produced them. To properly appreciate any architecture we must have knowledge of the spirit that produced it. Greek architecture is the visible expression of the wonderful Greek spirit of "intellectual lucidity which was the inspiration of Greek life." And how well Roman architecture expresses the greatness of the Romans, particularly as organisers and administrators! Of this classic spirit, which had such splendid results, Kenyon Cox says:—"The classic spirit is the disinterested search for perfection; it is the love of clearness and reasonableness and self-control; it is, above all, the love of permanence and continuity." It has been said that the short age of Pericles and the fifteenth and sixteenth centuries in Italy were the most fruitful for art in the history of the world. If we wish to understand the richness of Italian art we must know something of the fullness of Italian life that produced it. As architects we realise that it is not by slavish copying of great buildings that we can produce fine architecture, and that even knowledge of the life of which it is the expression is insufficient for our purpose; we must also realise to the best of our ability the underlying movements, the ideals and aspirations that animate the men and women around us. We have to endeavour to meet a demand that never confronted the builders of the past. Matthew Arnold has said that, "Though in many respects the ancients are far above us, there is something which we demand that they can never give." Our essential characteristics as a nation are said by Matthew Arnold, in his "Essays in Criticism," to be energy and honesty, and he proves that they are most important and fruitful qualities not only in the moral sphere but also in the intellectual and spiritual sphere; "and what that energy, which is the life of genius, above everything else demands and insists upon is freedom; entire independence of all authority, prescription, and routine—the fullest room to expand as it will. Therefore a nation whose chief spiritual characteristic is energy will not be very apt to set up in intellectual matters a fixed standard, an authority, like an academy." This want of a standard authority has been a great loss to us, not only in literature, but particularly as regards our monumental architecture, and it is to a great extent because the French have such an authority that their public buildings are, as a rule, so superior to our own. It is no wonder that, possessing the above characteristics, our domestic architecture is so much superior to our public buildings. An amount of individuality that, if expressed in the design of a public building, would be detrimental to its success, is not only permissible but even desirable in the case of domestic work, and the modern domestic architecture of our country is admitted to be excelled by none. As regards our architecture generally, the futility of disorganised individual effort has at last been realised, and in recent years the technique of the art, in its widest sense, has received a study such as had not been given to it since the days of Cockerell. In public buildings especially the personality of the designer should never be aggressive nor the dominant note; that should be given by the personality of the building. The subordination of the individual for the general good of the community is one of the most characteristic tendencies of the present time; we see this in the recognition of the value of organisation in building development, and in the importance now attached to the study of town planning, which implies the suppression of rampant individualism for certain general amenities, and a readiness to consider each other's work. The Englishman will spend money with pleasure on his own house, and with satisfaction on his business premises, but grudgingly on a public building, and will use every argument to reduce its size or its splendour; and this attitude, he says, is due to his dislike for show, but in many cases it would be more correctly ascribed to his stolid insensibility to art. The Frenchman, on the other hand, is a cheerful giver because, as a rule, he takes great interest and pride in his public monuments. There are, however, many signs of a hopeful change in our national taste, and the people generally are taking a growing interest in our architecture, and are also beginning to realise the fact that beauty in towns is in the long run both profitable and economical.

Easy communication suppresses more and more not only local but national characteristics. What, then, of the architecture of the future? Those most competent to form an opinion seem to agree that it will become more uniform over the whole of the civilised world. In this connection we may quote Jean Louis Pascal:—

"The time has passed when contemporary civilisations ignore even their nearest neighbours. There are no materials, no inventions, no new processes of one country that are not immediately known over all the world and employed everywhere. . . . More and more will architecture become universal—there will be little beside the conditions of climate and material which will make diversity."

THE NATIONAL POLICY AND BUILDING.

ABOVE the clash and fury of war we hear the clamour of the economists, the educationists, and the politicians, each with their own special scheme for securing to this country the full benefits of victory when it comes. The first want tariffs; the second technical education; and the last want many things—from taxes on enemy subjects to a general system of bounties and subsidies, either to special manufactures or to the ships which carry them.

All these require earnest attention in good time, but none of them alone will succeed in the main object, which should be to secure the economic independence of the Empire. We must never again allow ourselves to be caught in the condition in which we were, with our metal market in foreign hands, and the primary essentials of many of our industries only obtainable through alien channels. By permitting these things we have, as Sir Edward Carson says, been quietly forging the means of our own undoing.

The discussion of the political aspect of these questions does not come within our province. We are concerned with the industrial welfare of the country, and especially with that of the building trade. Great catastrophes like the present war must inevitably produce far-reaching results, and the whole economic circle of wages, rent, and the cost of building must receive a rude shock—its extent must depend upon the movement of wages in other trades, and this, in turn, upon the arrangements made as to tariffs. A general increase in cost of living is bound to be followed by general rise in wages, and that involves higher cost of houses and higher rents. Although, therefore, the building trade would be but slightly affected directly by a tariff—only such materials as glass, asphalt, steel and ironmongery being affected—the question seriously affects the trade indirectly. It is our largest industry, and is one of the few trades in which there is no competition from abroad. It is one in which we have excelled greatly, owing to our command of such varied and sterling materials and our innate genius for sound construction and beauty in form attained without effort.

We are asked to co-operate in a movement which aims at economic national independence, the raising of trade questions out of the field of politics, and the organised co-ordination of trade science and banking. Let us see what is the bearing of these proposals upon the future of the building industry, and what steps, if any, should be taken to protect it.

The Institute of Industry, which entertained recently such a distinguished body of leading manufacturers, has launched a campaign which has these objects for its purpose. Sir Edward Carson urged concentration of the efforts of traders and warned them against too many minor organisations; and here, it seems, is a chance to bring all the trade organisations together with one common object.

We entirely approve the main ideas and hope to see the Institute prosper, but we confess that we have our doubts as to whether traders will be persuaded to join until its programme is more definite. Many of the things suggested could be done by the present trade societies, and nothing but the formation of a clear programme of action will, in our opinion, capture the main body of traders.

The French Chambers of Commerce demand certain specific measures, such as an Allied Customs Union with bounties for exports, subsidies for merchant ships and mutual concessions, also measures to prevent money of the Allies being attracted to enemy countries by high interest, suppression of quotation of enemy shares, heavy taxes on enemy subjects, and higher rates on enemy trading houses, etc.

Some such schemes might well be adopted by the Institute of Industry as conducive to better trade at home, and beyond these traders would have opportunities of putting any other ideas before the Board for discussion.

For builders in particular here are some reforms which have long been evidently needed which this Institute might encourage. For instance, the better education of the workmen is a vital necessity, and there should be fixed grades of efficiency and wages should be regulated accordingly. The Institute might do good service in organising some plan of this kind. The trade unions might suitably assist. It would be a good augury for the future if they would show that they consider the efficient performance of the duties of the men to be not less important than the assertion of their rights. For employers we want better organisation of capital and the means of production, better facilities for training supervisors and better banking facilities. All these can be secured better through a general body of employers than through an isolated trade society.

Banking credits would be, however, a double-edged concession. In Berlin, for instance, we see that as a result of the easy terms of finance, large tracts of ripe land have been bought and sold again until ground rents have become much inflated and speculative builders demoralised.

As it is, our banking system is a protection against wild-cat schemes and over-speculation. Where the security is a permanent one there are always the insurance companies, but they usually demand redemption policies which provide for extinction of the loan in less than forty years. At the same time it must be remembered that they remove the serious risk which an ordinary mortgagee has to run of having his mortgage called in. The shortening of the period of loan is a step in the right direction.

Foreign contracts naturally require more support from the State than home contracts. The consular service must be improved, and our interests closely watched and information promptly given.

Perhaps the greatest service the Institute could do for building would be to stimulate in the public mind an interest in British real estate by collecting data to show the returns of existing property companies, and indicating profitable investments of this kind and encouraging reconstructions wherever necessary to avoid waste. This would stop the flow of capital abroad which did so much to retard developments here during the last twenty years.

GENERAL NEWS.

The Wallace Collection.

It is stated that the Wallace Collection, Hertford House, will be closed on February 1 till further notice.

Dover Rural Surveyorship.

At the meeting of the Dover Rural District Council recently, Mr. T. W. Woodruff was appointed Surveyor in place of the late Mr. Sargent. There were 160 applications for the appointment. Mr. Woodruff has acted as clerk of the works on the building of the East Kent Colliery village.

Strand Property Sale.

At the meeting of the London County Council on Tuesday it was agreed to purchase No. 25, Strand—needed for the improvement scheme—from Mr. Appenrodt for £15,550 leasehold. This money, with 5 per cent. interest, will not however be paid until one year after the termination of the war.

Electric Trains to Kingston.

Electric trains are to start running on two more sections of the London and South-Western Railway on Sunday next. The electric trains are now running on the short section from Waterloo to Wimbledon, *viâ* East Putney, and the new sections are the Kingston line from Waterloo and back, and the Thames valley line to Shepperton.

British Bridges for India.

It is stated that the contracts for 127 lattice-ype girder bridges, for the extension of the ymensingh-Bhairab Bazar section of the ssam-Bengal railway system, and for fourteen ridges, ranging from 20 to 60 metres (65 ft. to 96 ft.) span for the Federated Malay States ailways have recently been awarded to the leveland Building and Engineering Company, td., of Darlington.

British Industries Fair.

We understand that the Board of Trade ave let all the space available for exhibitors t the forthcoming British Industries Fair t South Kensington, subject to the restrictions f the Ministry of Munitions, where it is considered that the country's vital interests in he production of munitions, transport, etc., ould be prejudicially affected by permitting ertain firms to take part.

London Building Trade.

In the House of Commons on Thursday last eek Mr. W. T. Wilson (Labour, Westhoughton) sked the Prime Minister whether he had been sked by the London Master Builders' Association to meet a deputation from that Association o discuss the question of suspending or canelling contracts entered into prior to August 4, 914; and whether, before coming to any ecision on the matter, he would meet a eputation of the representatives of the orkmen engaged in the building trade.—Mr. squith: "No, sir. I have received no such equest."

Church Building Society.

The Incorporated Church Building Society eld its usual monthly meeting on the 20th nst. at the Society's House, 7, Dean's-yard, estminster Abbey, S.W., Lieut.-Colonel the on. G. H. W. Windsor-Clive in the chair. rants of money were made towards building ew churches at Cwmbran, St. Gabriel, lantarnam, Mon, £175; and Preston, St. uthbert, Lancs, £125. A grant of £20 was lso made towards reseating and repairing e Church of St. James, Newton, Cambs. rants were also paid for works completed t Shoreditch, St. Michael, Middlesex, £25; alisbury, St. Mark, £75; and Lambeth, Holy rinity, Surrey, £50. In addition to this e sum of £332 was paid towards the repairs eighteen churches from Trust Funds held y the Society. The Society likewise accepted e sums of £500 and £200 respectively as epair funds for the churches at Stanley, St. aul, Liverpool, and Charnock Richard, Christ hurch, Lancs.

Mr. McKim's Royal Gold Medal.

The House Committee of the American Institute of Architects has arranged for a cast to be made of the Royal Gold Medal presented on the recommendation of the R.I.B.A. to Mr. Chas. F. McKim in 1903, the original of which, at the request of Mr. McKim's daughter, is kept in possession of the American Institute. The cast will be gilded and appropriately placed in the Octagon (the premises of the Institute), and the orginal will be retained in a safe-deposit box.—*Journal* of the R.I.B.A.

Building at Hendon.

The war has had a great effect upon development in Hendon, although builders during 1915 were by no means idle. In the course of the twelve months the Council had under consideration 133 applications for approval of plans. Road-making was practically at a standstill; there was also a great falling-off in the number of dwelling-houses erected, as well as in buildings of the warehouse class. The total number of houses completed during the year 1915 for occupation was 486, the number in 1914 being 615 and 661 in 1913. At the end of the year exactly 200 were in course of erection as compared with 478 on December 31, 1914, while the number at the close of 1913 was 526.

R.I.B.A. War Record.

A Record is being kept at the Institute of Architects of the names of all members of the architectural profession who have joined the military or naval forces of the Crown for the period of the war. The list includes practising architects, their assistants and pupils, and architectural teachers and students, whether attached or not to the R.I.B.A. or other architectural body. So far some 2,100 names have been entered on the Record, but lately, in spite of the recent boom in recruiting, very few names have been received other than those of members of the Institute. The co-operation of members and non-members is specially invited in order to make the Record known and to bring about its completeness.

Garden City Movement.

The annual Report of the First Garden City, Ltd., gives evidence of considerable progress in the past twelve months. In February a combination of two Belgian engineering industries was attracted to the town, and by June were at work in three large buildings, and are now employing 1,200 men. The present population of the city is approaching 12,000, and, although 3,000 are Belgians, there is every likelihood that there will be a demand for houses for some time to come. Some hundreds of new cottages have been erected by various housing societies and by the Hitchin District Council. The accounts show that the net profit for the year was £5,823, an increase of £2,621 over the preceding year.

New Bridge across the Neva.

The fine new Palace Bridge (Dvortsovy Most) across the Neva, so styled, says the *Times*, on account of its situation almost immediately opposite the Winter Palace, is rapidly approaching completion. The bridge has been constructed in accordance with the plans of A. P. Pshenitsky, which were tendered at the competition announced by the municipal administration in 1908, R. F. Meltser being responsible for the architectural portion. It is a five-span structure, with a length of 246·94 metres between the shore abutments. There are eight girders in the width of the bridge, the distance between each being 3·60 metres. They are calculated to bear a load on the tramway lines of cars weighing 22 tons. The movable central span consists of two equal leaves. For opening it two methods are available—viz., mechanical, by means of electric motor; and hand, with the aid of a capstan. The piers rest on caissons sunk with the help of compressed air into the ground to a depth varying between 23·75 and 27·86 metres. Their working chambers, after they had been immersed to the required depth, were filled first with rubble and subsequently with concrete.

Lectures on War Memorials.

Professor S. D. Adshead, M.A., F.R.I.B.A., will deliver six public lectures on "War Memorials," illustrated with lantern slides, at the University of London, University College, on Wednesdays, at 5.30 p.m., beginning on January 26. Admission will be free.

General Closing of Museums.

The closing of the British Museum on the ground of national war economy is now officially announced. This step, it is definitely stated, forms part of a general plan for closing museums throughout the country. The statement on the subject, issued by the Director of the British Museum on Saturday, is as follows:—"In accordance with the decision of the Government that all public museums and galleries should be closed, the British Museum (including the Natural History Museum) will shortly be closed to the public. The Reading-room will remain open, but will be closed at dusk. Fuller particulars, including the precise date of closing, will be announced later."

Raphael and Michelangelo.

Mr. C. J. Holmes, M.A., Director of the National Portrait Gallery, gave at the Royal Institution on Saturday last the first of two lectures on "Raphael and Michelangelo." The lecturer said that many people thought that the education of an artist was limited to the years of his youth, whereas in reality the process of education lasted throughout his life. Reynolds in England and Rembrandt in Holland were perfect illustrations of this process of development. The evolution of genius might be likened to the growth of an organism in its response to the influence of every variety of stimuli. The case of Michelangelo strongly supported this contention. The process of change was going on all his life. He was in turn sculptor, painter, poet, and architect. Raphael began as a provincial stimulated by the intellectuality of Florence, then moved by the greatest genius of the Renaissance in Rome. This stimulus incited his talent to an extraordinary pitch of efficiency. He became almost omnipotent in the art world. He was architect of St. Peter's, surveyor of antiquities, and was overwhelmed with commissions under the stress of which he finally succumbed.

Preservation of London Commons.

Mr. Lawrence W. Chubb read a paper before the Royal Society of Arts recently on "The Common Lands of London," describing the work of the Commons and Footpaths Preservation Society, of which he is Secretary, in its fifty years of existence. He pointed out that between 1710 and 1809 about five million acres of common lands were divided, 219,724 acres being enclosed in the counties bordering London. Some of this land had since been repurchased on behalf of the public, as in the case of Hainault Forest. Greater London was still the happy possessor of 15,900 acres of common land. Every common ought to be under regulation to ensure law and order and its preservation as an open space. Our commons and parks had lately been put to extensive military uses, and had been the means of saving vast sums that would have had to be spent on training-grounds. It was not to be thought that after the successes of the Society nothing further remained to be done. But a new spirit prevailed, for the Inclosure Commissioners, who facilitated the appropriation of common land, had ceased to exist, and the Board of Agriculture, who took their place, were bound to regard public rather than private interests. It would be folly to sacrifice the commons on the altar of utilitarianism while millions of acres of enclosed land lay idle in the productive sense. Illegal enclosures were still taking place, and undesirable schemes of afforestation required to be watched. No one would assert that London was too well equipped with facilities for recreation when it was realised that there was but 1 acre of open space in London proper for every 678 inhabitants, while in Southwark there was only 1 acre for every 14,500 persons.

CORRESPONDENCE.

Closing of the Museums.

SIR,—The National Portrait Gallery is now closed to the public, the Wallace Collection will be so at the end of the present month, and it is announced that the British Museum (carrying with it the Natural History Museum) will shortly follow suit.

The wisdom or necessity of such action has been challenged, both in the *Times* of Saturday last and in an interview with a well-known critic published by the *Daily Telegraph* in last Monday's issue; but, while I fully appreciate the untiring efforts of Sir Claude Phillips to impress upon the public attention, and that of the Government, the necessity for more adequate protection of the art treasures contained in our great museums and public buildings, I do not feel that he gives sufficient prominence to the loss in the intellectual life of the nation which the total closing of our museums will entail.

"Economy in education," says the *Times* in its excellent leader of last Saturday, while showing that the educational use of museums is better understood to-day than ever it was, "is the least desirable of all economies, because it may inflict a permanent injury on the next generation."

In a living and growing democracy such as ours art must be considered in no sense as the hobby-horse of a few rich men and collectors, but as part of the vital force of the nation—nay, even of the race—as an influence which is to enrich and fertilise our whole national life.

We are out to win in a great fight—to win for the world which is to come the battle of democracy; and this fact is, I fully believe, beginning to be realised by the great democracies of America. But beyond the present stress of conflict we have to carry forward our very best material in art and thought and science to the years of reconstruction, which are before us when this incubus of European militarism shall have received its death-blow.

In this matter we have a duty not only to ourselves but to our Empire without; but if, as I believe, our true political future lies in the closer economic union of that Empire, so, too, our museums, with all their attendant activities, supply an outflow from the Empire's heart to every small township in Canada, Australia, and South Africa.

If, as Sir Claude Phillips says, their closing is necessary to give adequate protection to the contents, then we would all accept our loss as part of the great war sacrifice.

But is it so necessary?

Will the economy effected by the partial reduction of an already diminished staff—partial because police and fire-protection and general safeguarding must be continued—balance the loss to our intellectual energies, the opportunities for reference or study withdrawn from readers, architects, artists, and art students (the very class who suffer most from the present conditions), the probable interference with valuable lecture work, the loss to assistants trained to this specialised work—in a word, will the dislocation of a whole vast organisation of beneficent energies be worth the money saved? SELWYN BRINTON.

Burlington Fine Arts Club, W.

Apprentices.

SIR,—Mr. John P. White, of Bedford, in his letter in the *Builder* of December 3, points out the dearth of apprentices in wood-working craft, and "J. G. W.," in the *Builder* of December 24, says the question must be taken in hand nationally through our educational system. Anyone who has studied this most important, urgent, and indeed overdue question will agree, I think, broadly with each of those correspondents, but the difficulty is a practical remedy.

My object is to point out what has been done by the Institute of Builders, the body officially representing the building trade of the kingdom. Some four or five years ago the Institute discussed and formulated a scheme of apprenticeship which meets the point put by the above correspondents, and has since been doing its utmost to get the scheme adopted for London by the education authorities, but without success. The scheme includes provisions which may be shortly stated.

Early in 1912 the Institute submitted to the London Education Authority a constructive scheme of apprenticeship that would enable suitable boys to learn a trade under proper conditions directly they leave the Elementary School, on the lines following:—

(*a*) That the school age should be raised for such apprentices by two or even three years, so as to strengthen supervision and maintain, for part at least of the apprenticeship period, some connection between school and workshop.

Note.—This provision supplies the "more intimate link" desired by "J. G. W."

(*b*) The indentures recommended by the Institute of Builders were for a period of five years in workshops and on jobs, so that a boy could learn his trade under actual working conditions.

(*c*) That time on two afternoons in each week at full pay should be given to the study of the theoretical side of the chosen trade during the first two or three years of the apprenticeship term, so that theory and practice should advance together.

(*d*) Where a premium is required with an apprentice the Institute scheme would apply to the payment of such premiums a part of the money at present spent by the Education Authority in scholarships and similar rewards, sums now used mainly in subsidising non-industrial branches of higher education or in maintenance grants.

Note.—By this provision there would be no increase in the education rate.

(*e*) The connection between school and workshop, referred to in Clause A, could be maintained by a small voluntary advisory committee of managers and employers for each district or school division.

(*f*) The Institute scheme also included a schedule of premiums and rates of wages; these rates of pay are a very considerable advance on the wages until now being paid generally in the building or any other trade. The weekly wages in this schedule starts at 8s. 4d. per week of fifty hours, and in the fifth year rises to 27s. 1d. per week (or 6½d. per hour), and while they do not, and cannot, compare with boy wages at present obtaining owing to war conditions, the parental sacrifice of present advantage for the ultimate good of the boy is surely not a heavy one.

(*g*) Where no premium is paid the Institute's schedule of wages is rather less, so as to provide for payment of premium out of wages.

(*h*) A further part of the scheme is the provision of a bonus of £25 to the apprentice on completion of indentures for the purchase of tools, etc.

These are the main points of the scheme which was first put before all the borough councils of London and approved by twelve or thirteen of them, only one council having returned a definite negative and the rest making "no order."

The scheme has been carefully considered by educational experts, and is considered to contain the nucleus of a workable permissive

:heme which would gather in the boys between ɔurteen and fifteen years of age and take hem direct from the school to a trade, and hus prevent the wastage of good material rifting into "dead end" jobs, having no ltimate benefit when the boy becomes a man rith a man's opportunities and responsibilities.

The scheme has been before the Higher Education Committee of the L.C.C., and has een explained in conference with the ommittee, but, while sympathetic, the ommittee held that they had no statutory ower to adopt it.

The Institute has therefore this year ecided to request the co-operation of the ational Federation of Building Trades mployers of Great Britain and Ireland in ousing interest in, and support of, the scheme the building trade throughout the country, ith a view to Parliamentary action and the ovision of the necessary permissive powers the next Education Bill that must come efore Parliament and the country when e war is happily ended.

I apologise for the length of this letter, but e great importance of the matter is my cuse.

Thomas Costigan
(Secretary).

LAW REPORT.

Important Decision as to Drainage.

Recently, in the Marylebone County Court, before his Honour Sir W. Lucius Selfe, the Willesden Urban District Council sued Mr. William Taylor, builder, of Westbourne Park-villas, Paddington, for £39 6s. 3d., being the cost of repairing drains at one of his properties, 82, Princess-road, Willesden.

The facts were, that, acting on the information of a common informer, the Council sent one of their inspectors to view the drainage complained of, and on his report gave the defendant notice to do certain repairs. On a subsequent date the inspector called again, and reported to his Council that work had been done, but not of the nature demanded by the Council. Further notices were served on the tenant and the owner, and a date fixed for inspection—January 19 last. On the inspector and his workmen appearing at the premises they were refused admission. Thereupon the Council entered under an order from the magistrate, and did the necessary work, the cost of which was now sued for, with interest from the date of claim. It was stated that in May last the defendant entered an action for an injunction to prevent the Council carrying out the repairs, but that action was not proceeded with.

Mr. Herbert Davey, for the plaintiff Council, called the inspector to prove the state of the drains and the delivery of the statutory notices.

Mr. Adlington Willis, for the defendant, proposed to show that there was no such defect in the drains, as alleged, to make them injurious to health or a nuisance.

His Honour declined to hear this testimony, saying that that evidence should have been produced before a Local Government Board inquiry. Defendant's remedy was to have appealed to the Local Government Board within twenty-one days of the notice to repair, and his evidence would have been of avail at the consequent inquiry. In the circumstances he would order the defendant to pay £38 7s. 11d. into Court within a month, with the costs of this day, and that would give him an opportunity of appealing to the Local Government Board, if he was so advised.

FIFTY YEARS AGO.

Competitions.

Newcastle Cemetery.—The first premium for buildings has been awarded to Messrs. Bellamy & Hardy, Lincoln. The second for buildings, Mr. Stallwood, Scarborough. The first premium for laying out grounds, Messrs. Bellamy & Hardy; the second for carrying out grounds, Mr. Miller, Newcastle. The works are to be commenced at once under the direction of the successful competitors.

Neepsend Church, Sheffield.—Designs have been submitted to the Committee of the Church Extension Society in Sheffield for a new church to be erected at Neepsend, by the following architects:—Messrs. Flockton & Abbot, Messrs. Blackmore & Mitchell Withers, and Mr. Fletcher, all of Sheffield; and Mr. Thomas Charles Sorby, of London. The Committee have selected that by the last-named gentleman, and immediate steps will be taken towards the erection of the building.

The Reading New Workhouse.—Plans for the workhouse, to be erected in the Oxford-road, were recently sent to the Board of Guardians by six architects of this town, and the Poor Law Inspector on his last visit selected two, one executed by Mr. Woodman, and the other by Messrs. Brown, expressing, however, his preference, on several grounds, for Messrs. Brown's plan. The Board have finally selected Mr. Woodman's plan.

ILLUSTRATIONS.

St. Mary-le-Bow and St. Swithin.

WE reproduce these two plates from "The Churches of Sir Christopher Wren," by J. Clayton, which was published by Messrs. Longmans, Green, Brown & Longman in 1848, and which we give, by the courtesy of Messrs. Longmans, Green, & Co. The arcade shown at the side of the steeple of St. Mary-le-Bow was unfortunately never executed. In the elevation of St. Swithin given the "stone tracery" is omitted, and it is to be regretted it was ever added, as it is out of keeping with the style adopted by Wren. Further notes on these churches will be found on page 90.

St. Paul's Church, Derby-Lane, Liverpool.

THE style is Gothic, freely treated, and adapted to meet the special requirements of the materials employed. Externally the church is faced with small silvery-grey bricks, specially made for the work. The roof is covered with hand-made tiles.

The inside of the building, including the vaulted ceiling, is plastered, with the exception of the quoins, arches, and dressings round windows and doors, etc., which are composed of the bricks previously mentioned.

As regards the general design of the church, an attempt has been made to obtain an effect by largeness of scale and dignity of proportions rather than by elaboration of treatment. The main idea consists of three transepts on each side of the church, with a large square tower at the intersection of the central transept with the main roof. Internally the intersection of the transept vaulting with the main vault produces an original and striking effect, and results in the main arcade being composed of alternate high and low arches. In the transepts at each side of the church and in the end gable facing Derby-lane are groups of three tall lancet windows.

The principal dimensions of the church are as follows:—

Internal length, 142 ft. 3 in.

Width of nave and of chancel, 27 ft. 9 in.

Total internal width of church, including aisles, 57 ft. 4 in.

Height of nave and chancel roof, 40 ft.

The tower rises to a height of about 80 ft., and is surmounted by a pointed roof, making the total height to the apex about 108 ft.

Accommodation is provided for a congregation of about 640.

The contractors were Messrs. Morrison & Sons, of Wavertree, Liverpool.

G. GILBERT SCOTT.

Design for the Third Church of Christ Scientist.

THE design illustrated was submitted in competition some years ago for a church on the north side of Curzon-street, opposite the upper end of Clarges-street. An alternative treatment of the church, with a range of columns, is shown on the left-hand side of the interior view given, and was prepared at the request of the Church Committee.

MEETINGS.

FRIDAY, JANUARY 28.

Glasgow Technical College.—Mr. C. Ernest Munro, A.R.I.B.A., on "The Construction o a Factory in London." 7.45 p.m.

MONDAY, JANUARY 31.

ARCHITECTURAL SCHOOLS SECTION.

ARCHITECTURAL DECEPTIONS.

ALL civilised peoples, especially in the West, have held truth to be one of the greatest of virtues. The efforts of cientists are defined as the search after truth, nd it is natural that what has been considered o be axiomatic as applied to life and thought hould find an echo in the phraseology of art. The emphasis laid on truth has been the basis of Ruskinian criticism on art, and, though we more frequently hear now that architecture hould be the logical expression of structure, he implication still remains that architecture hould be condemned or praised chiefly on the basis of its truthfulness. Truthfulness usually mplies modesty, sincerity, and reserve, a feeling expressed by Shakespeare when he ays :—

> You that choose not by the view
> Chance as fair and choose as true.

And so it happens that the magnificence of Roman architecture and even the refinements f Greek art have not appealed to those whose minds have been obsessed with a sense of the alue of truthfulness in design, while the ruder xteriors of the great mediæval structures have been considered to enclose the jewelled casket f sincerity and perfect beauty. Enthusiasts have tended to overlook the fact that in more outhern climes the relative importance of xternals was always naturally greater than n less genial climates, and that it was as natural for Greek or Roman to display what was greatest in his art externally as for the mediæval builder to reserve it for interior ffect and to seek protection for it from the nclemencies of climate. Analytically we may uestion whether the builders of the great French cathedrals—perhaps the most logical xpression of purely structural requirements he world has seen—were not more governed y the enormous structural and financial ifficulties of raising the great cathedrals than nything else, and whether, given ampler means, hey would have hesitated to hide the masses f stone scaffolding formed by flying buttresses ehind screen walls. As it is, the western fronts of most of the French cathedrals considered by themselves hide and do not express he structure behind them. The west front f Salisbury is expanded at the sides into a quare screen, hiding the construction of the isles behind, and it is for the most part in maller churches that the west front becomes n expression of the structure of the building. t is probable that in placing their towers he mediæval builders were fully aware of the nsatisfactory nature of the outlines given by tructural form, and concealed them where it was possible to do so, while further south the talians showed in the west fronts of Siena, Orvieto, and other cathedrals how little regard hey had for the truthful or logical exposition f construction, though it must be admitted hat in the early Renaissance the disregard f structural form was carried even further, s many of our Elizabethan and Jacobean tructures testify. But criticism has been so rgely concentrated on the vices of the Renaissance that the sins of earlier times have assed almost unnoted. Most Southern races ttach a relative importance to external reatment which has no counterpart here, hough there are exceptions to the general ule. The Byzantine builders built from within outwards, and were usually careless of he external effects of their design, governed as t was by the desire to enshrine the mysteries f religion. The architecture of the Egyptians was the expression of mystery and organised riestcraft, and was concentrated chiefly on he treatment of internal courtyard and the anipulation of form to obtain effects of light nd shade in their many-columned hall. But he complaint preferred against our architects hat they consider external effect often to rgetfulness of internal convenience shows he national trend of thought. The cult of the Renaissance, which implies the consideration of proportion and order in form, introduced an element which had been before unthought of, the operation of which was to lead to greater concentration of thought on external considerations; and the task of the English architect is to combine this with a greater attention to internal considerations of design than is usually applied in more Southern lands, so as to combine the natural craving for comfort with the more ordered consideration of architectural qualities only fully understood by the cultured. According to a strictly logical or truthful standpoint, a balustrade or parapet is inadmissible unless it is the outcome of actual necessity, for a parapet frequently conveys the impression that a building is higher than it really is, while the purpose of a balustrade is to secure the safety of those using a platform or balcony.

But if we seek sincerity, logic, or truthfulness in structure we find few of the great buildings of the past will conform to the conditions we lay down, yet we are conscious that there are limitations which govern the designs which appeal to us, separating them from those which do not. One is that the exterior and interior expression of division shall be the same. The division of St. Paul's and many Renaissance churches into two exterior tiers or orders to express a single interior division never completely pleases us, though the same treatment applied to a building having interior galleries seems at once suitable. Conversely, the typical dissenting chapel of the middle of the nineteenth century, with its single external range of windows, severed internally by a gallery, offends our sense of fitness.

But if in a long range of two-storied building it is necessary to introduce a lofty room of the height of two floors, we feel it to be justifiable to light it by a double range of windows, though we are better pleased if a break in the treatment is feasible to express the changed internal condition.

The Chapel Royal at Whitehall, with its two external stories, is justified because it was to form but a part of an immense range of buildings of two stories in height. Had it been designed as an isolated building, Inigo Jones would have been at fault. In the same way it is felt that a few sham windows necessary to give uniformity to an elevation are permissible, but a range of blank windows constituted a defect. Grained woodwork throughout a building, however well it may be carried out, is unpleasant, but we have not the same objection to the marbling of a couple of columns in a large room, nor if for any reason a deal door occurred in a long stretch of oak panelling should we object to having it painted and grained to match the surrounding oak work. If in a long symmetrical front of a building containing lofty and large rooms it is necessary to place a small one, no annoyance is felt because a window far too large for its purpose is placed in it in order to secure the harmony of the façade, but we should be dissatisfied if the alternation of large and small rooms were not marked in some appropriate way in design. Consideration of these and other cases which occur will lead to the conviction that it is not so much truth and logic which we attach high value to in design as broad considerations of reason and fitness conforming to no very definite rules, which lead to the conviction that in matters of art we cannot emulate the certainties of scientific deduction.

There is in art nothing approaching to the logical proof of a scientific truth, because it is reasonable to assume there is nothing analogous to definite truth in art; rather the end to be sought is the golden mean between extravagant fancy and stern utility. Mouldings are the admitted means of subtleties of architectural expression, but, though we can trace how in their rudest form they arose out of the necessities of structure, they have been used almost purely decoratively for some thousands of years.

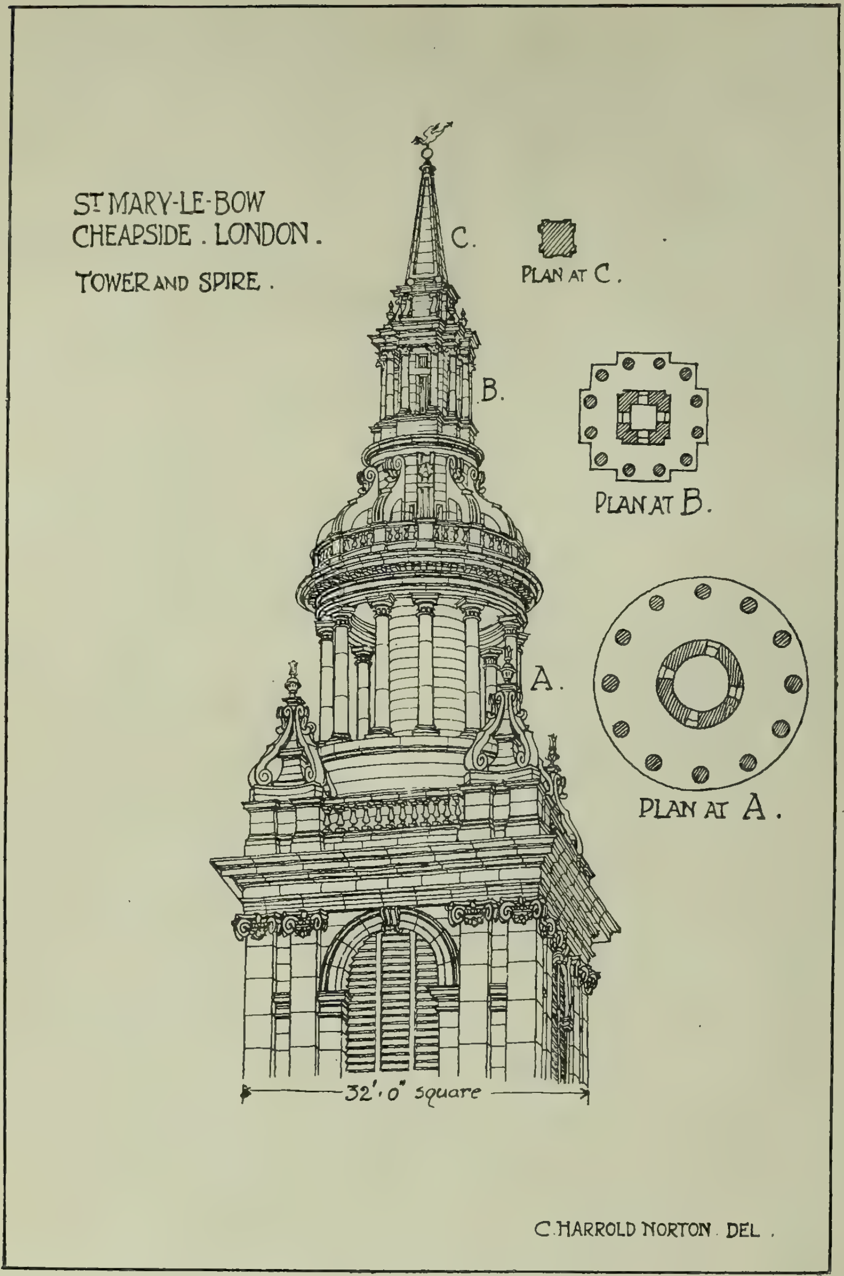
What should be our view of architectural deception when employed for temporary or scenic purposes? An instance in point is afforded by the temporary adjunct erected in front of Westminster Abbey at the time of the Coronation of King Edward. Was it permissible to imitate stone or not? Here it seems to us the sole question was whether the sham stone adjunct was more or less satisfactory in effect than a building of wood. If so, the scheme was abundantly justified in the same way that realism in stage scenery is justified; but if, on the other hand, a wooden building would form a better *mise en scène*, the adopted scheme was an artistic mistake. Any architectural deception which adds to the effect of a great pageant is not only permissible but proper, while the false sentiment and deficient artistic power which makes a Strawberry Hill possible deserves pity and condemnation.

With regard to another form of deceptive imitation—that of nature in architecture—we are on surer ground, and reflection will show that we dislike it for two reasons. Firstly, because it is impossible to imitate nature successfully; and, secondly, if we could do so, the manifestations of nature would suggest growth, change, motion, and decay—in a word, what is transitory; while the greatest charm which a work of art can have is that it should suggest restfulness and permanence. Thus the beauty of a perfect human figure may transcend in its perfection any sculptor's representation; but if it were possible to place in the niches or on the pinnacles of a great building figures so exquisitely modelled and coloured that they would give the impression of life, we should feel uncomfortable, for they would convey a dynamic instead of a static impression, and we should feel them to be out of keeping with the expression of permanence and not in keeping with the building of whose decoration they formed a part. For this reason the decoration of a winter garden in an American theatre carried out with actual foliage preserved in a petrifying solution was bad art, however successful in effect it might have been; nor would many worshippers at the shrine of mediæval art admire the custom that induced many of the mediæval builders to colour the leaves, flowers, and berries in their decorative ornament in natural colours. Such decoration must either have failed because it challenged comparison with nature so well as to do away with the static quality in architectural design, or so badly that it left room for criticism.

Our survey will convince us of the danger of dogmatism and the futility of importing terms which, reasonable and convincing as used in science and other branches of human thought, have no meaning in the confines of art.

SHORTAGE OF HOUSES.

To the "Welsh Housing Year-Book" for 1916 Mr. Henry R. Aldridge, Secretary, National Housing and Town-Planning Council, contributes an article on "Cottage-building after the War," from which we take the following :—"It is difficult to give any kind of valid estimate of the extent of this shortage of houses, but the writer is of opinion that the present shortage is at least 400,000 (of which 100,000 represents the number of cottages which should be built to satisfy rural needs). In the years following the war we shall therefore need to make up this deficit in addition to providing the number of cottages needed annually to meet the normal needs of the growing population. In this relation a leading authority—Mr. A. W. Shelton, of Nottingham—estimates that: 'Every week from 1,500 to 1,600 new houses are required to meet the normal growth of the population. In addition, at least 600 new houses are each week urgently needed to replace worn-out dwellings, or to mitigate overcrowding in congested areas. To provide these requires an annual expenditure of from £25,000,000 to £30,000,000 sterling.'"



THE LONDON CHURCHES OF WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

No. V.—St. Mary-le-Bow.

The church of St. Mary-le-Bow stands on the site of an older building which was destroyed in the Great Fire. The old church had a troublous history in 1090. The roof was overturned by a tempest of wind in 1196. At a subsequent date it is recorded that "William Fitzosbert, a seditious tailor, took the steeple of Bow and fortified it with munitions and victuals," and the authorities set fire to the steeple in order to dislodge him. In 1271 a great part of the steeple fell down and killed many people. In 1284 one citizen, having wounded another, fled to the church for sanctuary, but the friends of the injured man got in the church at night and killed him, in consequence of which sixteen men were hanged and a woman named Alice, "who caused the mischief," burnt ; after which the church was interdicted, the door and windows being "stopped up with thorns."

The steeple was rebuilt, and a few years later "the arches or bows thereupon, with the lanthorns, five in number, to wit, one at each corner and one on the top of the arches, were also finished of stone brought from Caen in Normandy."

These lanthorns were meant to be glazed to light the ways in winter. It was from the term "bow," or "arch," that the church derived its name. It was also known as St. Mary of the Arches, and the Court of Arches was formerly held there. It formed one of the thirteen "Peculiars" of the Archbishop of Canterbury in London, and was, and still is, under his jurisdiction. The church was repaired in 1620, but was totally destroyed in the Fire of London, together with St. Pancras, Soper-lane, and All Hallows', Honey-lane, which were not rebuilt after, their parishes being united with that of St. Mary-le-Bow. The parishes of All Hallows', Bread-street, and St. John the Evangelist were also united with that of St. Mary-le-Bow when the former church was pulled down in 1876.

A Norman crypt with three aisles still exists under the greater part of the existing church, and was apparently lighted directly from the sides, the level of the surrounding ground being lower than at present.

Wren's church was begun in 1671, but was not completed till 1680. Its cost was £15,400—a sum greater than was expended on any other of Wren's churches, the steeple costing nearly half of the whole amount.

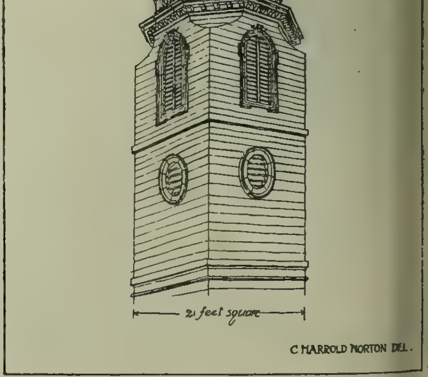
The steeple is justly considered to be among Wren's greatest achievements, and he evidently gave especial thought and consideration to it. The great columned doorways set in recessed semicircular openings, with elliptical openings over the entablatures of the doorways, flanked by cupids holding wreaths, are probably the most poetic architectural expression of the period. The tower is faultless in its proportions, its simplicity making a foil both for the rich doorways and the rhythmically-proportioned columned stories of the steeple above. The church is disappointing when we remember that the space at Wren's disposal exceeds that covered by St. Stephen's, Walbrook, and is even squarer in shape—an advantage for a design based on the dome, but a disadvantage in the case of an aisled design. As it is the church forms a nave with two aisles divided into three bays, the detail of which is without distinction. The east and west walls are pierced with a number of windows which are disturbing in internal composition. It has been modernised and much altered at an unfortunate date of which glass, woodwork, and decoration alike bear trace. Wren's original scheme included an arcade between the steeple and Bow-lane, in the space now occupied by shops, which was unfortunately not carried into execution.

There are several interesting monuments in the church, the chief of which was erected in memory of James Cust—who died in 1706—and six of his children, which takes the form of a pedimented feature with a sarcophagus and bust over. Another interesting monument, of a Greek type, is that to Thomas Newton, who obtained the rectory of the church in 1744 and was afterwards created Dean of Salisbury, Bishop of Bristol, and Dean of St. Paul's, and who edited Milton's "Paradise Lost." The monument to Charles Bainton, who died in 1712, is also of interest.

No. VI.—St. Swithin.

The church of St. Swithin is situated immediately opposite Cannon-street Station, between Salters' Hall-court and St. Swithin's-lane. The advowson is in private hands, and the parish was after the Great Fire united with that of St. Mary Bothaw, which was situated on the south side of Cannon-street, and was not rebuilt. The tower and steeple, like that of St. Mary Abchurch, is placed away from the most prominent front of the church, but in this case the loss is not a great one, since the form adopted, in which the square tower is reduced to an octagon by awkward curves, has little merit or charm.

The windows are divided by mullions with small circular lights in the heads—a form of design which is seen to greater advantage externally than internally. The plan, like that of St. Mary Abchurch, is a square, in this case converted into an octagon above. Several of the angles are marked by half-columns against walls, the remaining angle by a free standing column. Above, the ceiling forms a dome with slightly curved sides, with lunettes on four faces



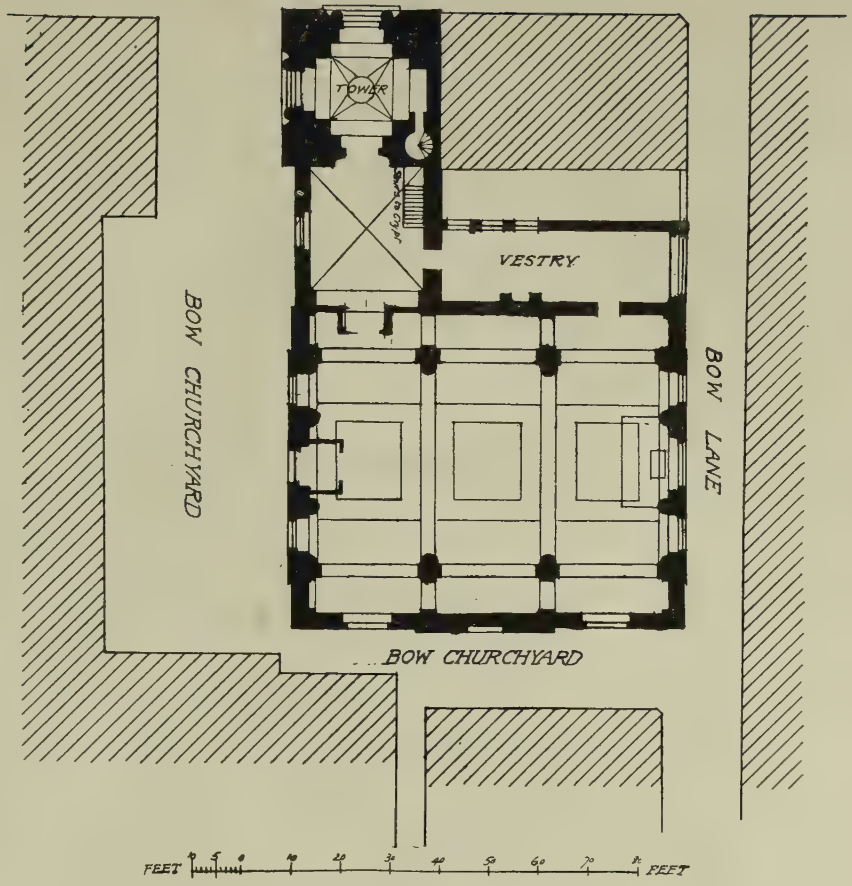
d medallions corresponding in form with
lunettes in the alternative faces, decorative
toons being arranged round the sides of
dallions and lunettes.

The woodwork of the church, though altered
l partly modernised, is good and interesting,
l the church contains some noteworthy
numents, the most noticeable of which is
Baroque one fixed to the face of the
e standing column, which affords a good
ample of the decorative value of Baroque
tail in architectural composition.

It was erected to the memory of Michael
dfrey, a financial expert whose experience
s of much use in connection with the forma-
n of the Bank of England. Being despatched
important business to Namur, which was
ing besieged by William III., he was killed
a cannon-ball in 1695.

On the Cannon-street front of the church
fixed the remains of the "London Stone,"
ich is supposed by some authorities to be the
ntral Roman milestone from which all
tances were measured.

Although St. Swithin is not among those
rches which have suffered most at the
nds of the restorer and ecclesiologist, it is to
regretted that it contains the usual coloured
ss and ecclesiastical additions which are
eign to its style and the designer's intention.
en's churches were intended primarily for
aching in an age which made little distinction
ween the treatment of secular and ecclesias-
al buildings. No additions which can be
de in the way of decoration can alter the
e, while they are as completely out of
rmony with the spirit of the original design
they would be in a Calvinistic conventicle.
s a pity that this fact should not be accepted
the Church, as Wren's buildings form a page
the past ecclesiastical history as well as
the architectural records of our country.
ir galleries, high-backed pews, pulpits with
nding-boards, clear glass windows, and sober
ouring should be considered as forming
t of their charm and character, though not
essarily a precedent for modern imitation.



St. Mary-le-Bow, Cheapside.

BOOKS.

ctural Design. By HORACE R. THAYER.
London: Constable & Co. Price 16s. net.)

s is the second volume by Mr. Thayer
Structural Design, and it deals with the
gn of simple structures, the author
ming, however, that the reader possesses
nowledge of mechanics, stresses, and the
essary mathematics, and that volume one
also been read by him. The first four
pters are devoted entirely to railway work,
are thus of greater interest to the engineer
n the architect, and these are followed
chapter on the design of steel mill buildings,
ch contains some useful matter. The two
t chapters deal with high office buildings
miscellaneous building work, and these are
most useful to the architect. It is hardly
essary to mention that all the actual
nples of high office buildings which are
trated are in America, the most notable
g the Woolworth Building, New York.
details and information dealing with this
s of work are interesting and instructive,
the author has spared no trouble to make
n complete, even the finishings being fully
sidered. The types of buildings described
er the miscellaneous chapters include
tres, grandstands, assembly halls, railroad
ions, and mine structures, and the principal
ts to consider in the design of the structure
ach case are put forward.

he last chapter is devoted to stand pipes
elevated tanks, and this is also quite good.
book is well illustrated throughout and
arranged, and it is a useful addition to
literature on structural engineering.

---

s and Clay Products. By ALFRED B.
CARLE. (London: Sir Isaac Pitman &
ns, Ltd. Price 1s. 6d. net.)

s is one of the publishers' series of common
modities of commerce, and no one more
petent than the author could have been
d to deal with the subject. For that reason the volume forms an admirable addition to this series of little works, which are not intended to exhaust the subject dealt with. The chief aim is to give the commercial man sufficient insight into the nature of the various materials and products described for him to realise the processes involved in their treatment and the extent to which they may be used for the purposes of his own business. The work is illustrated and contains a useful index.

Lime and Cement. By J. G. ADAMS and C. A. ELLIOTT. (London: Blackie & Son, Ltd.)

THIS is an admirable little work for boys and girls, which forms one of the publishers' series of "Rambles among Our Industries." The old trade guild arranged for a "wander year," when an apprentice, having served his time, spent a year in wandering from one master to another before settling to his trade. During the "wander year" the knowledge of the young apprentice was broadened, and he learnt the dignity of his craft. A like purpose has led the publishers to add to this series a number of books dealing with the main industries of the country. The work is illustrated and forms an excellent addition to the series.

Engineering Geology. By HEINRICH RIES, Ph.D., Professor of Economic Geology in Cornell University, and THOMAS L. WATSON, Ph.D., Professor of Economic Geology in the University of Virginia and State Geologist of Virginia. Second edition. (New York: John Wiley & Sons, Inc. London: Chapman & Hall, Ltd. Price 17s. net.)

THIS is the second edition of a valuable work of some 700 pages, divided into eighteen chapters, and containing over 100 plates, 250 figures or diagrams, and two useful indices.

The value of proper geological training for the engineer is admitted, and it is necessary that he should have adequate training in at least the fundamental principles of geology in their relation to engineering problems, and it is these principles with which the book before us deals. The authors state that they have attempted to emphasise the practical application of the topics treated to engineering work, "because hitherto, in many engineering courses of study, the subject of geology has not been given the attention which they think it should receive from both professors and students"—a remark, we believe, which is less true to-day than a few years ago. The work is intended primarily for civil engineers, but the authors hope it will be of use to others interested in applied geology—a hope which this admirable work entitles them to express. The value of the book is enhanced by the addition in the second edition of a chapter on "Historical Geology."

◆

HOSPITAL CONSTRUCTION MATERIAL AND EQUIPMENT, COLUMBIA.

The *Diario Oficial* (Bogotá) of November 16 publishes a law granting 30,000 hectares (about 74,100 acres) of land to the Municipality of Ipiales, in the Department of Nariño. The Municipality will sell this land in lots by public tender and the proceeds of the sale will be devoted to the construction and equipment of a hospital in the town of Ipiales. The plans of the work must be presented to the Colombian Ministry of Public Works for approval.

BUILDING MATERIALS, CANADA.

H.M. Trade Commissioner in Canada (Mr. C. Hamilton Wickes) has forwarded the following inquiries:—A firm in Toronto wishes to be put in touch with United Kingdom manufacturers of building materials other than roofing slates and tiles. (Reference No. 10.) United Kingdom manufacturers of the goods mentioned, and exporters of United Kingdom goods, desirous of initiating business in Canada, may obtain the names and addresses of the respective inquirers on application to the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C. In making application the appropriate reference number should be quoted.

THE BUILDING TRADE.

AN ECONOMIC SURVEY OF 1915.

AT the close of a complete year of war it may be of interest to note some of the industrial conditions prevailing in this country generally, and also to note the effect of those conditions on the building trade.

When the possibility of any great war in which this country might be involved was only the subject of speculation the food problem was always much dwelt upon, and alarming pictures were drawn of the straits we might be reduced to, therefore it surely is a ground for considerable thankfulness to find that after seventeen months of the greatest war imaginable the rise in the cost of food is far less than could have been anticipated, and less than half that which has occurred in the continental countries with which we are at war. The average price (retail) of food in this country is 45 per cent. above the level which existed in July, 1914, just before the war, and the rise during the year 1915 has been 23 per cent. In Berlin in November the average price of food was 82 per cent. above the pre-war level, and in October in Vienna prices were 117 per cent. above those prevailing in July, 1914. This unexpected result of the war is due to our Navy, and must be an unpleasant surprise to our enemies, who find themselves occupying the position they had designed for us.

This rise in prices of 45 per cent. would, however, be a serious matter for our industrial population had it not been qualified by two other considerations—a rise in wages and increased opportunities of obtaining work for those who are left at home to carry on the industry of the country.

The changes in the rates of wages, or by war bonuses, have affected 3,165,000 workpeople, and the net result has been an increase of £603,000 per week, which, the *Labour Gazette* states, averages about 3s. 10d. a head. This is exclusive of overtime, and these figures do not include seamen, agricultural labourers, railway servants, police, Government employees, shop assistants, and others.

The mean annual percentage of unemployment for 1915 is 1·1 per cent. as compared with 3·3 per cent. in 1914, and in November and December it was as low as 0·6 per cent.

Although it is to be regretted that any labour disputes should have occurred during the war, yet it will be seen that patriotism has exerted its influence, and, although the number of workpeople involved in disputes is not very considerably less in 1915 than in the preceding year, yet the loss of working days has been but 2,969,700 as compared with 10,111,337. These are the main industrial economic features of this year of war, and we will now consider their bearing on the building trade.

The figures available in the *Labour Gazette* are by no means exhaustive in the case of the building trade, as they refer principally only to carpenters and plumbers, but nevertheless they afford some indication of conditions in the trade. In 1914 134,000 men had their rates of wages changed, with the net result of a gain of £13,600 a week. In 1915 110,000 workpeople had their rates of wages changed, with a nearly similar result, the weekly gain being £13,900. The latter figures would represent about 2s. 6d. increase a head per week. This is, of course, exclusive of overtime. The statistics as to unemployment do not give much idea of the real state of the trade, as so many men have enlisted or gone to other work that there is a shortage of labour. The carpenters and plumbers at the end of the year had 1·6 per cent. unemployed, or 0·5 per cent. less than a year ago. "Insured" workmen had 2·8 unemployed, or 2·7 per cent. less than a year ago.

As regards disputes, 1915 was a peaceful year compared with its predecessor, which witnessed the great dispute in London which lasted all but seven months. The loss of working days was 129,600 as compared with 3,199,426.

We do not know what the rates of wages in Germany have been during the course of the war, but the German trade unions give some returns as to unemployment, and in November they show 4·4 per cent. unemployed amongst building trade operatives and 6·3 per cent. amongst painters.

Building is one of the first trades to suffer in a great war, and we can only be thankful that things are as well as they are. The trade is prepared to endure the hardships of war in order to see a really satisfactory conclusion and to attain a peace founded on really solid foundations; but it is to be hoped that the horrors of war will not be added to by the horrors of hasty and partial legislation which may add to its difficulties for no adequate reason.

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Aberdeen.—The T.C. has passed the following plans:—Two dwelling-houses, Orchard-street, for Messrs. Joseph Shirras & Son, builders; addition to engineering works, King-street-place, for Messrs. John M. Henderson & Co., engineers; addition to comb works, Hutcheon-street, for the Aberdeen Comb Works Company, Ltd., per Mr. William Boice, engineer.

Aberystwyth.—The T.C. has approved plans of a building in Castle-street, submitted by Mr. H. H. Davies, Pier-street, and of alterations to the Old Bank premises in Pier-street, by the City Brewery Company, and to 37, Terrace-road, by Messrs. T. Ellis & Co.

Barnes.—Plans approved by the D.C.:—Four houses, Vine-road, Mr. Ernest Bates; four houses, Westwood-road, Barnes, Mr. Ernest Bates; and one house, Percival-road, Mortlake, Mr. Ernest Gale.

Bedford.—Plans passed by the T.C.:—Temporary extensions to aeroplane engine shop, Queen's Engineering Works, for Messrs. W. H. Allen, Son, & Co., Ltd.; storeroom, County Theatre, Midland-road, for the County Theatre; temporary meter house, Hurst-grove, for Messrs. W. H. Allen, Son, & Co., Ltd.

Bexhill.—The Council has accepted a tender for erecting an observation pavilion for the new isolation hospital at £757 6s. 3d.

Bradford.—The committee engaged in providing additional hospital accommodation in Bradford for wounded soldiers has adopted a scheme to increase the accommodation at the War Hospital.

Bradwell (Staffs).—The Staffordshire C.C. has approved an estimate of £1,000 in respect of an advance by way of additional loan to the Bradwell Joint Hospital Committee in respect of additions and alterations to the Bradwell Isolation Hospital, subject to the L.G.B.'s sanction.

Cardiff.—A scheme for the extension of the King Edward VII. Hospital at Cardiff was under consideration at a recent meeting of the board of management. It is estimated that the whole scheme would cost £46,506 for building.

Colombia.—The *Diario Oficial* (Bogotá) of November 16 publishes a law granting 30,000 hectares (about 74,100 acres) of land to the Municipality of Ipiales, in the Department of Nariño. The Municipality will sell this land in lots by public tender and the proceeds of the sale will be devoted to the construction and equipment of a hospital in the town of Ipiales. The plans of the work must be presented to the Colombian Ministry of Public Works for approval.

Cootehill (County Cavan).—The people of Cootehill have decided upon the erection of a new Catholic church.

Darlington.—The R.D.C. has approved a plan for a proposed temporary shed at Geneva Works, for Mr. J. F. Wake; also plan for a house Heighington, for Mr. F. Dresser.

Dartmouth.—The contract for the erection o wing to the Royal Naval College, Dartmou has been placed with Messrs. G. E. Wallis Sons, Ltd., of Maidstone. The work will started without delay.

Denby and Cumberworth.—The U.D.C. approved plans for a mechanics' shop at H cliffe Mills, and the conversion of dwelling-ho into a butcher's sale shop for the Scissett operative Society at Denby Dale.

Droitwich.—Plans are before the T.C. for extension and improvement of the grou adjoining St. Andrew's Brine Baths and wid ing the thoroughfare

Dublin.—The L.G.B. has held an inquiry i an application made by the South Dublin R for sanction to a supplemental loan of £10,000 connection with the Labourers Acts. The Bo agreed to sanction a loan of £31,110, being at rate of £170 per cottage.

Epsom.—Plans approved by the U.D.C. Messrs. Seth Smith & Munro, for the Ch Estate, two houses to be built at West H avenue; Mr. E. Stredwick, for the Chase Esta two pairs of cottages to be built at Upper Cou road.

Greenock.—Greenock Dean of Guild Court granted Messrs. John Walker & Co., su refiners, Princes-street, warrant for the erect of a building to be used as an extension of th cartage platforms and as a sugar store.

Harrogate.—Plans approved by the T.C.:— F. and Miss Vevers' plan for alterations to N 10 and 10A, James-street; Messrs. Shaw & C plan for alterations to premises at the rear shop in James-street.; Messrs. Lawrence & H Ltd., plan for alterations to stabling for fur ture repository in Back Skipton-road; Mr. Hamilton Brown's plan for garage in Corn close, Langcliffe-avenue; Mr. A. Hymas's p for a pair of villas in the Grove, Park Pl Estate.

Hilderstone (Staffs).—The Staffordshire C has adopted an amended scheme for the adap tion and division of the Wooliscroft Far Hilderstone, into small holdings, subject to approval of the Board of Agriculture a Fisheries.

Huddersfield.—At a recent meeting of the T the Borough Engineer submitted map showi the laying out of town-planning schemes A, and C proposed, also map in connection the with. It was resolved that the Borough Engin prepare and submit map showing area inclusion in the supplemental town-planni scheme.

Irlam.—At a recent meeting of the U.D.C. Surveyor submitted amended plans and es mates of proposed improvements at the sewa farm, and these having been fully considered, was resolved on their adoption, at a cost £15,240.

London.—The L.C.C. has sanctioned expen ture of £58 5s. 8d. for laying wood block floor at the Effra-parade School (Norwood), and £230 for strengthening a wall at the Ne inger School (Bermondsey). It has approv plans submitted by the managers of the Paul's C.E. non-provided school (Mile End) carrying out alterations to the premises, a plans submitted by the managers of the Michael's R.C. School (Paddington S.) alterations and improvements to the premis and by the managers of the Westmoreland-r R.C. School (Paddington S.) for improving a enlarging the premises. rmouth.—The T.C. has approved a plan for house at the A.B.C. Wharf, Southgates- , for Messrs. Newhouse, Ltd.

ENERAL BUILDING NEWS.

TECHNICAL SCHOOL, HITCHIN.

e new Hitchin Technical School, of which Walter Millard was the architect, has been ed at the rear of the old Town Hall in d-street, and incorporated into the older ling. It is now open for the reception of ls. The cost of erection is £3,325. A fireproof staircase directly faces the main nce, at the summit of which is a spacious ng with lantern light and windows. The entrance hall has been laid in teak. At the rear of the ground floor means are provided for the study of carpentry, metal and other manual work, and also for cookery and housewifery. The two first-floor classrooms are capable of being thrown into one and utilised as a lecture-hall or for the purposes of a large class. A smaller room on the same floor is to be used as a teacher's room. The school is lighted throughout by means of electricity, with emergency gas jets, and is heated by radiators. Ventilation is provided by swing casements and hoppers. The floors are of wood blocks or cement, and the walls are colour-washed. Messrs. J. Willmott & Sons were the general contractors for the work. Various parts of the work were carried out by Messrs. Gatward & Sons, Ltd., and Messrs. J. Smallwood & Co. The classrooms were furnished by the Educational Supply Association, and the carpentry school under the direction of Mr. R. R. Bunn, of the St. Albans Technical School.

SAILORS' HOME, AVONMOUTH.

The new Sailors' Rest and Home, Meadow-street, Avonmouth, has recently been opened by the Lord Mayor of Bristol and the Lady Mayoress. The premises have a prominent southerly aspect in Meadow-street, and the entrance lobby leads direct to a spacious restaurant and sitting-room. At the far end is the kitchen and serving department, with storage and pantry accommodation. On the first floor are fifteen cubicles arranged round the dormitory. The work has been carried out by Mr. Longden. The architects are Messrs. La Trobe & Weston.

TRADE NEWS.

Boyle's latest patent "air-pump" ventilators have been adopted for the pump-room and mechanics' workshop at Meadow-lane Gas Works for the City of Leeds Gas Department.

The Dufftown Isolation Hospital is being supplied with Shorland's warm air ventilating patent Manchester stoves by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

Messrs. Kerner-Greenwood & Co. have sent us particulars of a test with Pudlo which has been carried out by the Japanese Imperial Government. A diagram sent to us shows that by comparison with a Japanese, German, and American waterproofer Pudloed cement with 2 of sand and also 3 of sand is more waterproof than the others in a neat cement mixture. The fact that Pudloed cement is able to carry two or three times its bulk in sand is certainly worthy of consideration, even if only from an economical standpoint. We should state that a waterproofer in powder form helps towards the ultimate success of the work owing to its stable nature, and also because the ingredients with which it is mixed are granular, thus ensuring a thorough mixture. There can also be no evaporation and no loss of strength. In fact, Pudlo actually improves with age. Pudlo is entirely British in composition, and is manufactured and sold in this country.

THE LONDON COUNTY COUNCIL.

THE first meeting of the London County Council after the Christmas recess was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. Cyril Jackson, Chairman, presiding.

Loan.—Sanction was given to the borrowing by the Hackney Borough Council of £3,000 for contribution towards cost of street improvements.

Elementary School, Croydon.—The Croydon Local Education Authority have notified the Education Committee of their intention to provide a new public elementary school for about 200 children in the neighbourhood of Broad-green, Croydon.

Eleventh Asylum.—It was reported by the Asylums and Mental Deficiency Committee that in consequence of representations from the Finance Committee H.M. Treasury have intimated that they are not prepared to approve of the continuance of expenditure for the erection of the Eleventh Asylum, and the Committee have taken steps to stop work on the buildings as early as possible.

New County Hall.—The Establishment Committee reported that they had authorised the settlement at £1,650 and £6,000 of claims of Messrs. Holloway Brothers, Ltd., in respect of certain machinery, etc., in their premises on the site of the new County Hall. The Committee have arranged for the sale of the machinery in question. The Committee have approved a proposal for the extension, at an estimated cost of £1,500, of the return of the river wall some distance further behind the existing river front than was contemplated, and have arranged for the work to be executed by Messrs. Morrison & Mason, Ltd., the contractors for the river wall extension, as an extra on their contract.

Alterations at Existing Places of Public Entertainment.—The Theatres and Music Halls Committee have approved arrangements with respect to the undermentioned premises:—75, Balham High-road—alterations to operating, etc., enclosures, provision of tea-room; Bear-street, Leicester-square (Cinema de Paris)—alterations in the ventilating arrangements, formation of draught lobby; 326, Bethnal Green-road—rearrangement of lavatory accommodation and ventilation; 54-55, Blackfriars-road—rearrangement of seating; Broadway Theatre, Deptford—conversion of theatre for use for cinematograph entertainments; 105-107, Charing Cross-road—alterations; Coldharbour-lane, Brixton (Electric Pavilion)—provision of landing at head of north-east exit steps; 17, Crawford-place, Marylebone—ventilation arrangements; 192-196, East India Dock-road—ventilation arrangements; 280, Edgware-road—provision of draught doors in vestibule and corridors; Empire Theatre of Varieties, Leicester-square—provision of temporary cinematograph enclosure; 17-19, Great Windmill-street—alterations; Grove Vale, East Dulwich (Imperial Hall) — alterations; High-street, Clapham (Electric Pavilion)—alterations; 133, High-street, Deptford—alterations in ventilation of cinematograph enclosures and formation of

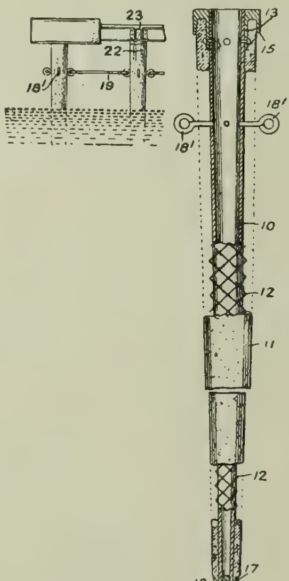
10,356 of 1915.—William Story: Glazing roofs and like structures.

10,384 of 1915.—Moritz Kahn: Metal fabrics for use in ferro-concrete construction.

SELECTED PATENTS.

16,301 of 1914.—Charles Irving Deane: Piles.

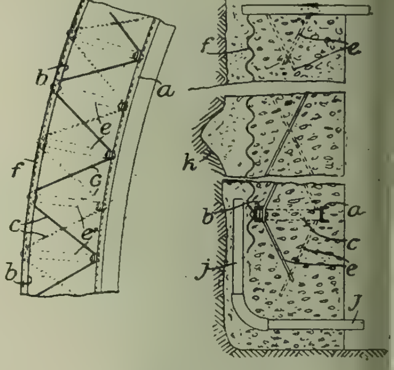
This relates to a concrete pile having a metallic core 10 and provided with a head 13 and shoe 16 permanently fastened to the core. A concrete shell 11 is rigidly attached to the core between the head and shoe, its upper end being enveloped by a flange 15 on the head. Reinforcement 12 may be incorporated in the concrete. The shoe is attached by means of an upstanding threaded stud 18, which is surrounded by a recess 17 formed by a flange on the shoe. Eye-bolts 18¹ screwed into the core serve for the connection of stays and bracing-rods 19. When the pile is to be driven by jetting, the shoe is provided with a central aperture and the core is made hollow. A post 22 may be inserted at the top of the hollow core for the attachment of connections 23.



16,301 of 1914.

16,801 of 1914.—Edmund Lawrence Hann and Christopher Kearton: Wells, shafts, tunnels, etc.

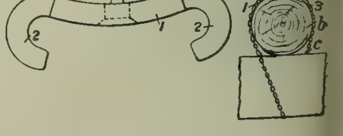
This relates to ferro-concrete lining for wells, shafts, or tunnels, in which the reinforcement consists of a series of ring frames each comprising inner and outer channel-irons *a*, *b* connected by diagonal bracing-members adjacent ring frames being connected togeth by diagonal bracing-members *e*. The fram work is surrounded by a casing *f* built of me segments, the segments being preferal flanged and the abutting flanges weld together. The casing may be corrugat and recesses *k* may be provided in the wall the excavation. Cement is introduced behi the casing *f*, as by means of a pipe *j*.



16,801 of 1914.

17,474 of 1914.—Sydney Eric Asplan Scaffolding.

This relates to a device for use in scaffoldi comprising a plate 1 having a chisel spik on its concave side and two hooks 2 or a h and an eye on the other side. The spik driven into the upright pole *b* and a s chain *c* is passed round the pole and ledger is hooked to the hooks on the plate. The c may be secured at one end to the eye on plate.



17,474 of 1914.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to THE BUILDER LTD., and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

FOREIGN AND COLONIAL.

Embankment and School Construction, etc., Spain.

The *Gaceta de Madrid* of January 10 notifies that tenders will be received at the "Dirección General de Obras Públicas, Ministerio de Fomento," Madrid, up to February 3, for the construction of an embankment on the sea front at the port of Corunna, at an estimated cost of 1,498,335 pesetas (about £59,900). A period of five years will be allowed for carrying out the works. A deposit of 74,917 pesetas (about £3,000) is required to qualify any tender. Local representation is necessary. Specifications and plans, etc., may be consulted at the above-mentioned "Dirección General" or at the offices of the Civil Government at Corunna. The same issue of the *Gaceta* notifies that tenders will be opened by the municipal authorities at Vallmoll, on February 12, for the construction of a school building at that town at an estimated cost of 89,548 pesetas (about £3,600). Although this contract will probably be awarded to a Spanish firm, nevertheless the carrying out of the works may involve the purchase of some materials outside Spain.

The *Gaceta* of January 13 notifies that sealed tenders will be received by the "Servicio Central Hidráulico, Dirección General de Obras Públicas, Ministerio de Fomento," Madrid, up to 1 p.m. on February 4, for the supply and delivery of 1,500 metric tons of cement required in connection with the Agujero drainage works. A deposit of 2,000 pesetas (about £80) is required to qualify any tender. Local representation is necessary. Further particulars (in Spanish) may be consulted by United Kingdom cement manufacturers at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall-street, London, E.C., where also may be seen the general specifications and conditions of tender issued by the "Ministerio de Fomento" for the supply of cement required for public works in Spain.

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

VOL. CX.—No. 3809. FEBRUARY 4, 1916.

MONUMENTS AND REASON.

IT is natural that the subject of monuments should occupy the attention of architects and artists at the present time, for the cessation of many of the normal art activities of the community gives artists time to think out the probable effect of war on the arts and the nands which will be made on artists and architects when ice is re-established. At the same time it is wise to ognise that the practical demands on the nation's depleted ources will be so enormous that it is unlikely that any great r memorials will be carried out within a decade of the nination of the war. Small personal memorials will no ıbt be erected in numbers, and a discussion of the whole oject is useful and within the range of practical politics, en at a time when all our hopes and energies must be ıcentrated on the measures by which alone victory can be ained—the systematic and untiring prosecution of the war, ed by the collective organisation of the nation's resources.

The delivery of the first of Professor Adshead's lectures "War Memorials: Their Significance and Treatment," on dnesday, the 26th ult., was followed by a meeting held at the ildhall on Friday, the 28th, under the chairmanship of the rd Mayor, at which the Civic Arts Association was inaugurated er some admirable speeches by Lord Beauchamp, Professor wyn Image, Professor Lethaby, and others; while last dnesday Mr. Lawrence Weaver delivered a lecture at rpenters' Hall on the same subject, which he has also treated his recent book.

Monumental art has never been well understood or preciated in this country, and since the days in which the at living force of tradition died down our monuments ve too often suggested the unfortunate experiments of the o and the amateur, exciting a mild interest and often ridicule the minds of the public. The conservatism of the national racter, its inherent suspicion of the histrionic element in , and its individualistic traits have all been contributory ses to this neglect; a people whom the foreigner thinks of as ng cold and unemotional, because it is self-conscious, is likely to indulge like the Latin races in the expression of otion in terms of stone.

For this reason we doubt whether the colossal events now ing place, by which the destinies of nations and the future Europe may be permanently settled, will leave their mark on nation's art to the extent of that of other countries. The st moving and important episodes in the history of our race— signing of Magna Charta, the victories of Blenheim, afalgar, and Waterloo, the capture of Quebec, the Declaration American Independence, and, lastly, the magnificent rally the Dominions beyond the Seas to the aid of Britain—are accompanied with the dramatic incidents which would be oused in France, Italy, and we may add Germany. It will left to a future generation to realise to the full the mense significance of the events through which we are w passing and the personal attributes of the actors in the sent drama.

Though we may regret this for æsthetic reasons, we would have it otherwise, for, if the last century has seemed of crude and unlovely commercial development in which vn and country have been spoiled, it is precisely that velopment which has given this country the material power which the fortunes of the whole war may turn, and it is in same way the material and commercial developments ich will follow the present war which may at some future enable Greater Britain once more to secure the preponderance right.

Meanwhile we are entirely in sympathy with the endeavour to arouse public interest in the subject of memorials, though we believe those who wish to make progress possible should apply the precept *festina lente.* Nothing provokes reaction so quickly as injudicious enthusiasm; nothing is likely to meet with a more chilling response in this country than proposals which are open to the criticism of being over-impetuous. For better or worse as a nation we have no wish to "stagger humanity," and under no conceivable circumstances would the epoch of Louis-Quatorze have been possible in English history, nor with many times the resources of the Augustan Cæsars would the people ever be led to emulate the magnificence of Imperial Rome. We have in smaller memorials much to learn from the characteristic tablets and memorials in our old churches, to which good lettering, a sparing and characteristic use of ornament, and architectural form give point and distinction, and the admirable policy of the Civic Arts Association, whose aim is to encourage and utilise local talent, which is amply sufficient to fill these wants, is just what is required.

Professor Adshead stated in his lecture that monuments to commemorate the present war must be conceived on a gigantic scale, and he went on to sketch what this scale should be in the following passage:—

> But war memorials in a city cannot always be conceived on this gigantic scale, nor indeed always in this way. A classification of the more important of possible treatments from the point of view of their purpose and placing would give first consideration to the great shrines and Valhallas which stand in noble isolation on the summit of a mountain or the rising ground in the midst of a great plain. It might simulate a great shrine to be approached with awe and reverence. There might be a great glade, then a huge open space, flights of a thousand steps and terraces acres in extent. Its climax might be a great altar; the emblem of sacrifice a colossal figure of peace or the image of some great warrior of national significance. At the climax of such an approach might be a Valhalla, a temple set upon a rock. If of naval significance the finest of sites would probably be a small island in the sea or some commanding position on the mainland overlooking and approached from the sea.

Although we appreciate a very able exposition of the subject, we feel that such schemes are alien to the national character, and would in this country never be carried into execution. A Napoleon, even a Wilhelm II., or possibly the French, Italian, or American peoples might carry out monumental schemes on this scale, but here both temperament and history will operate against their possibility. A finely-conceived bridge over the Thames, a Memorial Chapel at Westminster, or the building of a southern embankment along the river are more likely to be the type of memorial schemes which will find support in this country when the time comes for the consideration of any permanent commemoration of the events of war.

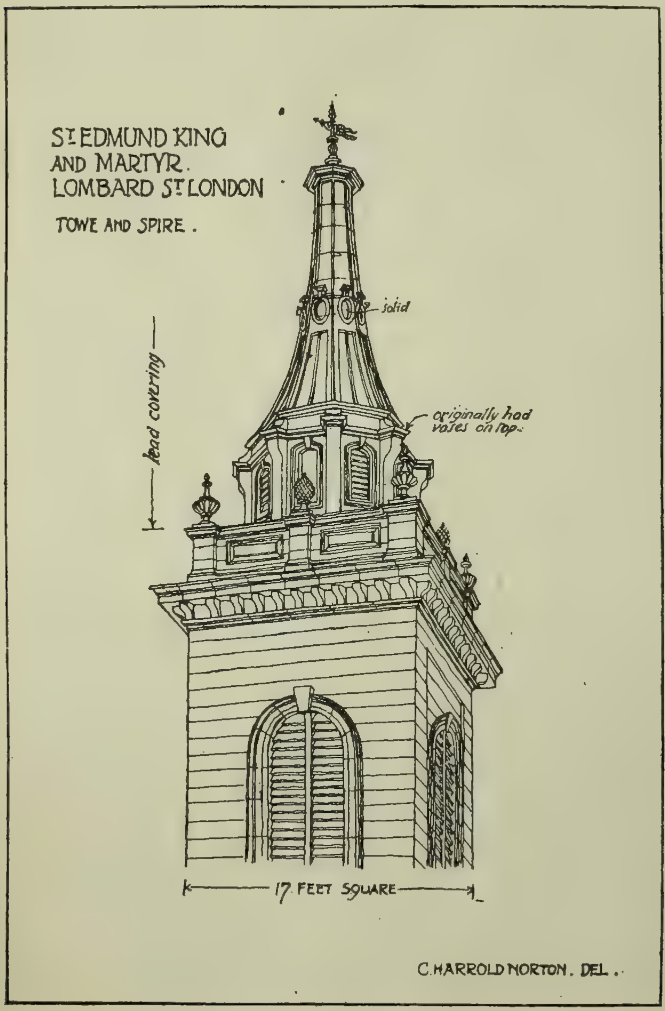
While we have the utmost sympathy and wish to see the cause of the architectural and sculptured arts furthered and advanced, and consider it a defect that so little attention is paid to these matters in our country, we feel that the process of education must be a very gradual one, and that national temperament sets limits to what is possible—limits that it is wisest for all to recognise, lest in proposing too much we lose the support which we might obtain—a support which is essential if national art is to be developed to its fullest extent. The Baroque spirit in Southern lands is often shown by the erection of magnificent gateways without apparent purpose; that spirit would make it possible to erect monuments in plains and desolate places; but here the *raison d'être* of a monument must be that it can be seen by many, and the size and scale of a monument will be largely determined by the position it occupies, not the event it commemorates—by reason rather than sentiment.

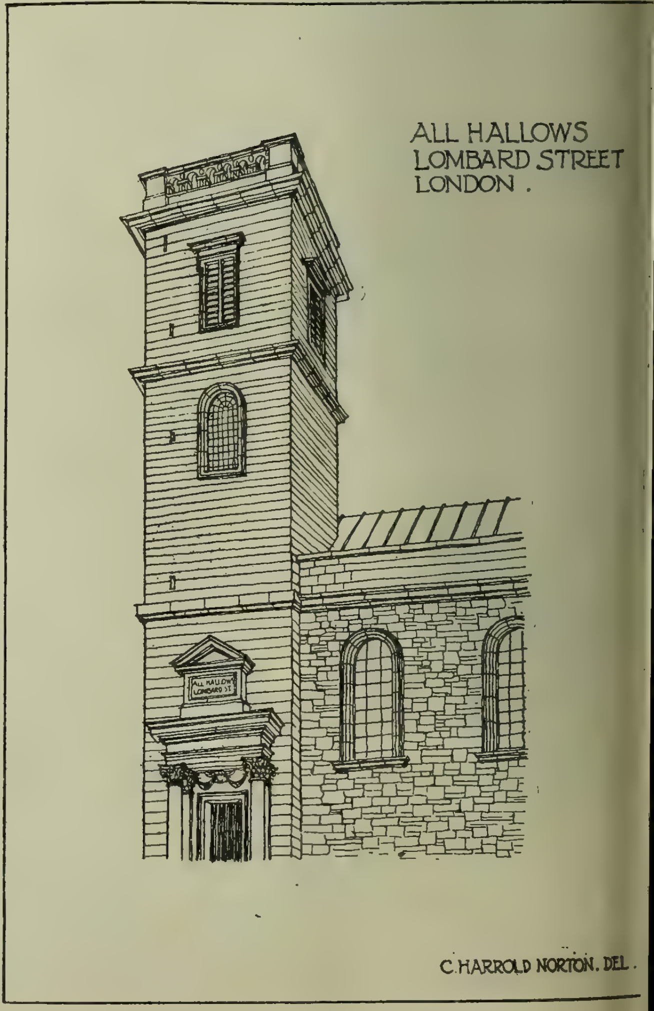
NOTES.

The Civic Arts Association. We consider the formation of a Civic Arts Association a happy augury that the people are waking up to the fact that most of the money that has in past years been spent in the erection of memorials has been money thrown away in bad and objectless art. The conviction expressed by Professor Selwyn Image and others who addressed the meeting held at the Mansion House last Friday, that most districts contain artists who, as in the past, are waiting to be entrusted with the design and fashioning of local memorials, is, we are sure, justified. And the Civic Arts Association will perform a much-needed task in acting as a local consultative committee with a view, not to directing those who erect memorials to come to London for designers, but of ensuring the recognition of local talent. It is the local flavour and character of Old English design which have made it such a treasure-house for students; it is the pride in what is best and most truly local out of which great national art in the past has sprung; and it is useless to write learned books on the beauty of past ages if we neglect the fountain-head out of which all has been derived—the pride and the glory of craftsmanship appreciated in the places where it has been born. We may have to wait years for the great monuments of the future, but those years will be full of promise if in the meantime we tend and encourage the rebirth of intelligent design in minor things in town and country alike. We wish the new Association, which, presided over by the Lord Mayor of London, counts many distinguished men among its ranks, a long and successful career, and trust that it may gather support and strength throughout the length and breadth of the land.

Professor Adshead's Lectures. We think the course of lectures which Professor Adshead is giving at University College every Wednesday at 5.30, in which he is dealing with war memorials in every aspect, is very opportune and useful to those interested in the arts. We believe it will be long before the psychological moment arrives when the erection of great war memorials will be on the *tapis*, but that is the more reason why we should make use of the interval to obtain education and form views as to the principles which should be followed in design, since we cannot claim to have the inborn and inherent taste in such matters which belongs to the Latin races. Compromise is inherent in our race, and the Englishman does not lose himself in abstractions or become an inspired enthusiast readily as the Spaniard and Italian did, and the Frenchma throughout his history did and does, and so it is probable that shall always seek some compromise between utility and beau instead of seeking beauty alone. The Victor Emmanuel monume at Rome would be impossible here, although England is a rich country than Italy; nor can we hope to emulate Paris in a certa note of magnificence and stateliness which distinguish its wide spac and vistas; but by accustoming ourselves to the contemplati and study of great schemes we may acquire a wider, freer outlo in matters of art which will in time bear fruit. But we belie the greatest monuments which will be erected here will be like to take the form of some necessary work more splendidly accomplish than usual—the building of monumental buildings rather th monuments themselves.

An Excellent Scheme. We hear that the authorities have in view remodelling of public-houses in the areas rou naval bases with a view to converting them in pleasant centres of hospitality and refreshme instead of leaving them mere "drinking shops," and the ideal aim at is to be the good-class inn of Nelson's day, with its comforta and pleasant rooms, picturesque bars, and fireplaces. In a wor they would adopt the ideals aimed at by Lord Grey's Trust, whi sells alcoholic drink but insists that good food and accommodati should at the same time be provided for the sojourner. We belie that the insistence on a good standard of comfort and accommodati and the obligation to supply meals at all reasonable hours in inns a hotels would do more to promote the cause of temperance than ma of the drastic measures which are supported by reformers. T record of "Prohibition" in America is not altogether an encouragi one, while, like other measures of compulsion, it carries with it t suggestion that the common sense and public spirit of co munities are at fault. We are not alluding here to military servi which, being a first necessity to the safety of the State, stands on different footing, but to measures which, however applied, constitu a criticism of the citizen's right to order his own private actio The proposal we have mentioned is fascinating from the arc tectural standpoints. The historic inns of England are an ass both to history and to art, and we should like to see an addition ma to their number, especially if the project were combined wi improvements from a social and human standpoint.





THE LONDON CHURCHES OF WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

No. VII.—St. Clement Danes.

The Church of St. Clement Danes is one of the largest and most interesting works of Wren, because, unlike almost all of his other work, it stands free in the middle of the Strand, surrounded by the remnant of what was originally a larger churchyard, but is now confined to an elliptical island site, the axis of which does not coincide with that of the church.

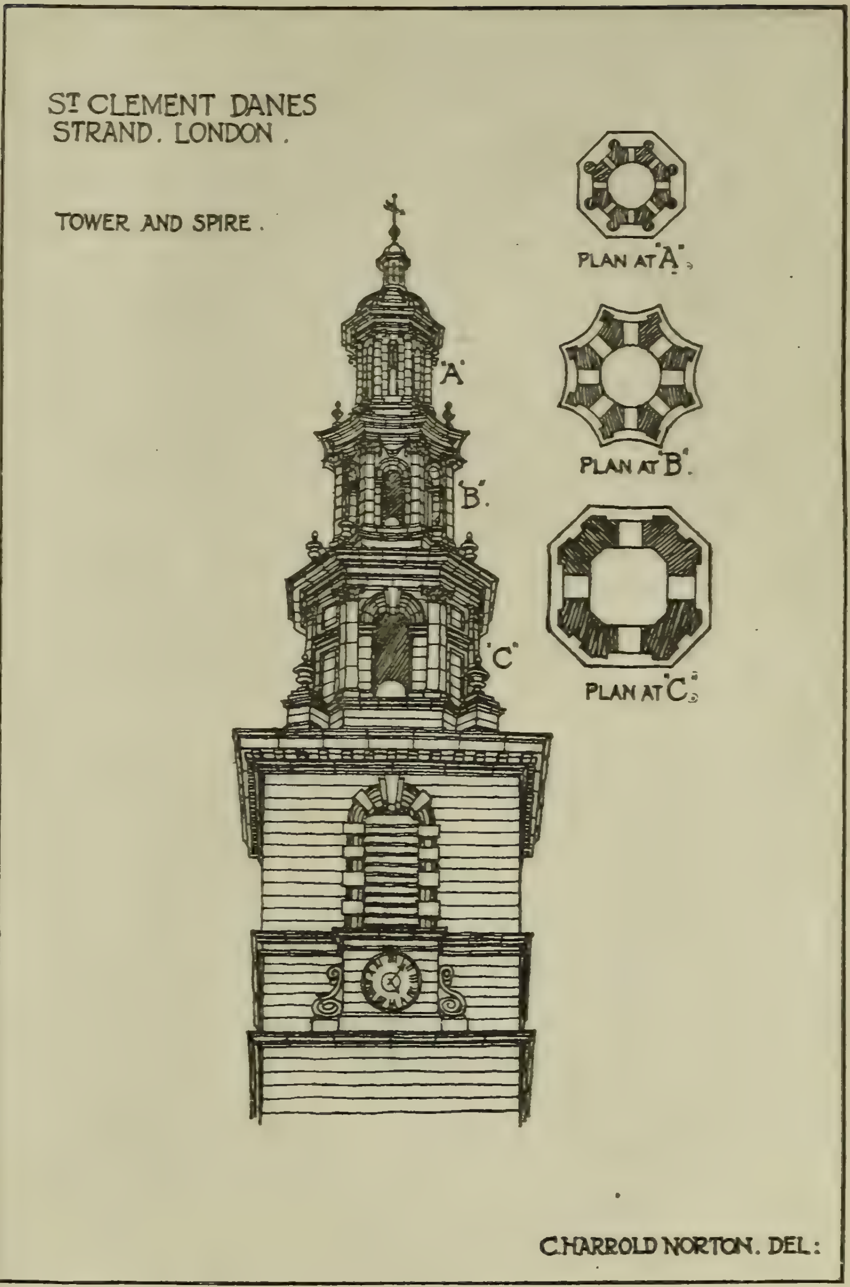
Several explanations of the term "Danes" have been suggested, the most picturesque of which is that when King Alfred had driven the Danes out of the City of London he was desirous that those Danes who had married English women should become Christians and settle westward, to promote which object the first church was built in the ninth century. St. Clement, according to tradition, was martyred by being fixed to an anchor and thrown into the sea by order of the Emperor Trajan, and the anchor which occurs in the decorations of the church and marks the boundaries of the parish is an emblem of the saint. The existing tower is reputed to contain in its mass the original tower, which was sometimes used as a beacon to guide the course of shipping on the Thames, and at others as a position where ordnance could be mounted to quell riots and disturbances.

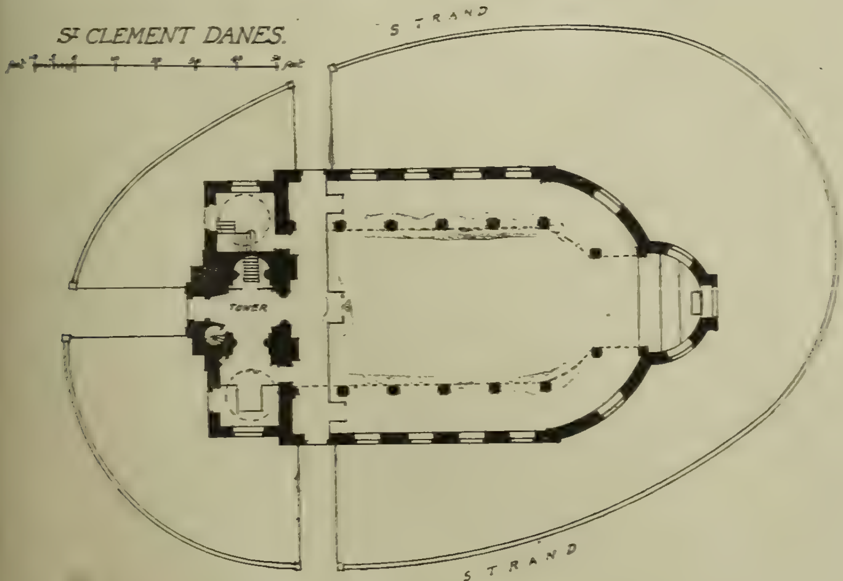
The bells of the church are referred to in the old couplet, "Oranges and lemons, The Bells of St. Clement's," which may owe its origin to an old custom in pursuance of which the servants who occupied Clement's Inn were in the habit of presenting oranges and lemons to the occupants of chambers in the Inn.

The old church, being greatly decayed, was taken down in the year 1680 and rebuilt two years later.

The church contains many memorial tablets and monuments. Among them are those to Sir Christopher Wren, George Haskard (the Rector of St. Clement's previous to the rebuilding of the church), and a memorial to the Twining family. The memory of Samuel Johnson, who was a constant attendant, is recalled by a brass plate affixed to the seat he occupied, a memorial window, and a statue in the eastern portion of the church enclosure.

The architectural interest of the church is concentrated externally in the curious treatment of the west front, especially in the lower stages of the tower, which is reminiscent of the freedom of earlier work. The two domed annexes flanking the tower on either side are pleasing in their proportion and outlines, and the sweep of the nave and apse is both good and simple.





St. Clement Danes, Strand.

(Reproduced from the Ordnance Survey Plan, with the sanction of the Controller of H.M. Stationery Office.)

The design of the tower was evidently hampered by the necessity of retaining parts of the original structure; the steeple added by Gibb, though picturesque, is a poor piece of design, and the outline of its second story with the entablature arranged in concave sweeps is neither dignified nor happy. Internally the church is the most successful of all Wren's aisled designs, the concentration of interest towards the east end being especially happy in conception, and giving, what is so often lacking in Renaissance churches, a fitting emphasis to the chancel and altar. Though the decorative character in detail is secular, as in all work of the time, the dignity and harmony suitable to a church are fully preserved. The scheme of decoration needs, to give it full effect, more light and less colour, and would be greatly enhanced by the substitution of clear glass for stained glass windows, though they are more pleasing than most which have been inserted in other churches. The influence of the stresses in the roof trusses is seen in the columns which have been slightly thrust outwards; the bands round the oak columns are unfortunate, and might well be removed with advantage to the internal effect and dignity of the church.

St. Clement Danes, Strand, W.C.

No. VIII.—St. Edmund the King and Martyr.

The Church of St. Edmund the King and Martyr is situated on the north side of Lombard-street, opposite Clement's-lane. Edmund, the King of East Anglia, was taken prisoner by the Danes and shot to death by arrows, and the Abbey of Bury St. Edmunds was erected over his remains. After the Fire the Church of St. Nicholas Acons, which stood in Nicholas-lane, was not re-erected, its parish being united with that of St. Edmund the King and Martyr, the living of which is in the gift of the See of Canterbury.

The church stands north and south, the altar being placed in a recess in the north end.

Internally this is one of the darkest of Wren's churches, owing to the confined limits of the site and the height of adjoining buildings, and has been rendered darker still by the introduction of stained glass. The side and end windows do little under the circumstances to dispel the gloom of the interior, which may be said to be dependent on artificial light. A small skylight in the centre, now done away with, added to the insufficient light given by the windows, but at the same time detracted, as all flat ceiling lights inevitably do, from the effect of architectural form; because of the architectural axiom that the effective admission of light must be obtained by means of architectural features, not by the elimination of surfaces, a fact which explains the unsatisfactory appearance of a glass dome and the effectiveness of a range of windows round the base of a dome or lantern. There is some good woodwork in the church, though the high-backed pews, excepting the seats set apart for churchwardens near the south entrance, have been replaced by benches. The chief monument is one to Jeremiah Milles, Dean of Exeter, Rector of the united parishes, who died in 1784.

The exterior is among the most interesting of Wren's smaller churches, and with St. Nicholas Cole Abbey shows traces of Dutch influence in the unusual and quaint design of the leadwork of steeple. Many of the lead ornaments of the upper stages are now gone, but the succession of picturesque curves, broken by lunettes and ornaments, are very pleasing, while the stonework of the simple front is well balanced and full of character, and forms a much needed break in the monotony of a somewhat dreary succession of buildings devoted to commercial purposes. Though occupying an important frontage, the area occupied by the church is so small that its continued existence is probably better secured by circumstances than that of the large Church of All Hallows, Lombard-street, which, while set back from the adjoining streets, prevents the full utilisation of a most valuable and important angle site. The appointments to the living are made by the Crown and the See of Canterbury alternately, as the advowson of St. Nicholas Acons was vested in the Crown.

No. IX.—All Hallows, Lombard-Street.

All Hallows, Lombard-street, is one of the "concealed churches," being reached by a narrow passage from Lombard-street. The exterior has little beauty or architectural character; the interior, which is very dark, has a fine coved ceiling, the detail of which can be only seen by artificial light. A ceiling light was inserted in 1880. The woodwork is good, especially the altar-piece and pulpit. The coved ceiling is mitred back on each side of the heads of the windows, an arrangement characteristic of several of Wren's churches.

Like St. Edmund the King and Martyr the living is in the gift of the See of Canterbury, and with the parish of All Hallows have been united those of St. Benet, Gracechurch, pulled down in 1867, and St. Dionis Backchurch, which was pulled down in 1878, its ten bells being rehung in the tower of All Hallows. It is somewhat singular that All Hallows, which is one of the larger of the contemporary churches, has fewer claims to architectural distinction than many of the smaller works of Wren.

WAR MEMORIALS:

THEIR SIGNIFICANCE AND TREATMENT.

The first of a course of lectures on "War Memorials" was given at University College on Wednesday last week by Professor S. D. Adshead, M.A., and from it we take the following:—

"From the remotest ages it has ever been the custom of man to put on permanent record epoch-making events, and it would appear that up to quite modern times such records have always been of a strictly æsthetic and non-utilitarian kind. It is to the utilitarian patriots of last century that must be credited the discovery that such a memorial could take the form of a hospital or similar public institution. Only the other day I heard of a small urban council who, with an eye to thrift and economy, decided to commemorate the jubilee of Queen Victoria by the construction of a new public sewer. Needless to say it is not with such memorials that I am concerned.

It is generally assumed that the purpose of the war memorial is to celebrate victory, and, whilst this is so as regards most memorials that would come under this head, it must be remembered that there are some which it would be more correct to describe as monuments to peace. As to whether the patriotic spirit of a nation is extravagantly fostered by its indulgence in the erection of monuments commemorating victory, and as to whether excessive indulgence in this direction embitters rather than obliterates that feeling of wounded pride which must in some measure lurk in the heart of the vanquished, are questions which involve an inquiry, not only into the sentiment and purpose of the monument, but also into the ambitions, aspirations, and good taste of the nation that inspire its design.

War memorials have been erected with various ends in view, both for the purpose of inspiring noble action and also, it must regretfully be admitted, for inspiring demoniacal deeds. But the finest type of memorial is that which, whilst arousing the best sort of patriotism, at the same time holds no sting, innuendo, or cruel insinuation, either in the volubility of its sculpture or in its massive outline. How far from this ideal are those German monstrosities of post-Bismarckian days. They are the symbols of frightfulness, arrogance, and brutality, and a menace to the independence of man. They are a war cry rather than a message of peace and victory, and these Germans have learned it well. How different from the spirit of the typical French memorial, which simply presents the triumph of victory over death!

A war memorial designed with the noblest intentions should inspire hero worship and kindle in a nation the highest form of patriotism, that posterity may jealously guard a heritage dearly bought; and whilst all monuments designed to stimulate patriotism are not, strictly speaking, war memorials, at the same time it must be admitted that few great monuments have been erected that do not more or less directly relate to war.

Perhaps the finest idea is to erect something which, rather than eulogising war, commemorates peace. In its presentation it might be a sublime female figure symbolising humanity serenely gazing into the future and arising victorious above the blood-bespattered incidents of war. With such an interpretation the susceptibilities of even the most sensitive of vanquished nations would be honoured rather than provoked.

A war memorial may be prophetic and inspiring as well as retrospective; if it is both it will be sublime. But history shows us that this heralding of a future has not always meant the anticipation of eternal peace. Quite the reverse. The spirit of the later Germanic utterances in stone has undoubtedly been war, and still war, for by the sword shall Germany prosper. Fortunately, however, this has not been the sentiment of all war memorials. Perhaps no finer utterance can be discovered than that which is writ on the pedestal of a colossal figure of Christ, which, erected at the head of a mighty gorge and overshadowed by the loftiest peaks of the Andes, memorialises the celebration of peace between Argentina and Chili. The words are these: "Sooner shall these mountains crumble to dust than Argentines and Chilians break the peace which at the feet of Christ the Redeemer they have sworn to maintain." This is the pledge of two nations without a past, but who anticipate a great future.

Thus there is the war monument that is practically nothing more than an insult and a challenge—the monument of victory and the monument of peace. But there is another kind of war monument—"the monument of annihilation and disastrous defeat."

There is a sublime pathos in such a presentation, and we see something of it in most of the French monuments that have been erected since the war of 1870.

War memorials may commemorate victories achieved or disasters in which a nation has been engulfed, but they can also anticipate a peace that leaves no stain.

I am not here to plead the cause of peace, nor is it quite my *rôle* to discuss the ethics of war, but it is impossible to analyse the metaphysical aspect of the war memorial without being reminded of the enormous influence which it can be made to exert on posterity as a means of healing the wounded feelings of belligerents and leading them out of the paths of discord towards the glorious prospects of peace.

Let us, then, for a moment investigate this idea a little further and examine the spirit of the design in its relation to the national outlook. In the spirit of the design there is embodied a message, and it is this message which appeals to the patriotic instincts of a nation. To express it the designer of monuments must have a sensitive and sympathetic nature, and must understand and be deeply moved by the intellectual, historical, and political events which surround the occasion that has prompted his design. As an example, what in words is expressed in the spirit of the recently erected war monuments in Germany? Perhaps something of the sentiment they arouse is conveyed in the following lines:—

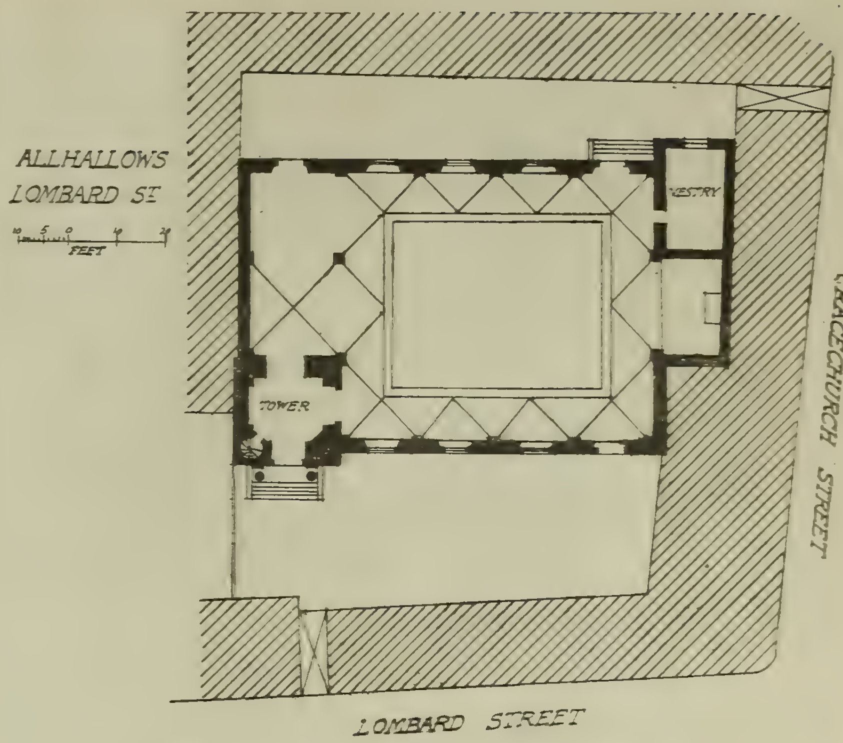
> From off the earth
> Flee justice, sentiment, and truth,
> Chivalry, gentility, and all the joys of youth.
> These Germany shall crush with brutal force,
> Through blood with iron she'll carve her vaunted course.

And, as a contrast, what is the spirit of the monuments erected to commemorate the wars of Napoleon? Perhaps, "The glory of France lies in her imperial dignity."

Quite different is the call of her later Republican memorials, which seem to proclaim: "Liberty, fraternity, and equality live eternally, the hope of France is in her posterity."

And what is the spirit of the monuments erected by the Italians to commemorate their fight for independence and unification, long striven after by Mazzini, Cavour, and Garibaldi between the forties and seventies of last century? Perhaps, "In the struggle of the masses of Italy was found independence and unity."

And what is the spirit of those monuments that have been erected in England to commemorate the South African War? It would be difficult to say. Perhaps the occasion of their erection is too near our time to venture an interpretation. Perhaps the circumstances of the war were such as could not arouse in this country the deepest national emotion. True, they depict the virtue of British pluck and endurance in the khaki-clad soldier, but great national ideals they certainly do not present.



Wren's Churches: All Hallows, Lombard-Street.

(Reproduced from the Ordnance Survey Map, with the sanction of the Controller of H.M. Stationery Office.) (*See page* 101.)

So it would seem that to have a great war memorial we must have a great cause, met by a great people inspired with the noblest ideals. How could the blood and iron policy of Germany proclaim its barbaric and brutal message other than by attempting to cloak itself in the spirit of the unsophisticated, the uncivilised, the archaic, and the savage? Only in such a guise could the military dominance of Germany be expressed in stone. And so Germany, to find inspiration for her post-Bismarckian monuments and to interpret the creed of her military party, has turned to Odin and Thor and the stone gods of their barbaric past for the personification of her great war god, Bismarck, the man of blood and iron.

Certain world-worn architectural forms have by repeated usage come to be recognised as the great symbols of war and victory. Amongst such may be mentioned in particular the arch and column; they evoke that subliminal sense of endurance, resistance, and permanence which an isolated piece of sculpture can never call forth. There is a royal grandeur and an imperial splendour about a great arch which nothing else can supply. A massive portal suggests the opening out of new worlds, it tabulates recollections of all great conquests.

Again, there is something heroic about a figure set upon a column; it suggests the triumph of an indomitable will. And if arches and columns suggested these things to the ancients, they suggest them with even greater force to us to-day. Continued use and resuscitation has woven around them a glory of tradition which time has enhanced and recognition petrified.

With the Greeks architecture was a priestess invoking the constant exercise of their imagination; but to the Roman, with his love of splendour and display, it assumed the semblance of an opulent queen. If her presence was necessary to the Greeks, to live under the shadow of her magnificence became an obsession with the Roman, who filled his imperial city with fifty triumphal arches and numerous lofty columns.

The mediævalist, essentially an individualist, was in the first place an adherent of the Church of Rome, and only in a secondary capacity a member of the State, and therefore with true religious zeal he memorialised his warriors and commemorated his victories in offerings to the Church. He built chapels and erected effigies, where the ancients and also the moderns in a more profane manner erected isolated statues and memorials tending to the deification of man.

It was not until the Renaissance that the great war memorials of the Romans were re-discovered and re-used. Indeed the use of the arch and column for such a purpose was not properly appreciated until the time of Napoleon, when Percier and Fontaine erected the arch of Carrousel in 1806 in front of the Louvre, a fit symbol of the imperial power of the First Consul, and a forerunner of the Arc-de-Triomphe erected later on.

The monument that is fundamentally an architectural composition can alone evoke the deepest sentiments of a great people. In the words of Symonds, "Architecture, more almost than any art, connects itself indissolubly with the life, the character, and the moral being of a nation and of an epoch."

But we have said, and it must still be asserted, that the most intimate and personal emotions can only be aroused by sculpture; the figure expresses in a more concrete way than architecture the whole gamut of the emotions, and thus we get the gods of peace and war.

To the adherent of the Church of Rome the symbolic representation of peace could only with true religious fervour be a figure of Christ. The profane presentation, on the other hand, is a female figure representing Humanity and holding in her hand the olive branch or the staff of Mercury."

BOOKS RECEIVED.

Elements of Heat-Power Engineering. By C. F. Hirshfeld, M.M.E., and Wm. N. Barnard, M.E. (London: Chapman & Hall, Ltd. 21s. net; New York: Jno. Wiley & Sons.)

Text-Book of Geology. Part II.—Historical Geology. By Chas. Schuchert. (London: Chapman & Hall, Ltd. 12s. net; New York: Jno. Wiley & Sons.)

GENERAL NEWS.

Professional Announcement.

Mr. G. Herbert Bayley, civil engineer and surveyor, of 19, Cooper-street, Manchester, has been transferred by the Council to the class of full members of the Institution of Civil Engineers.

Housing Scheme, Coventry.

The contractors for 600 new houses at Stoke Heath, Coventry, have begun building operations. During the past three months the land acquired for the houses has been cleared of hedges, drains and gas mains have been put in, and the site has been almost encircled with railway metals. The houses will form fourteen streets, and each house will have a garden. A site for a permanent institute has been secured.

The Memorial to Florence Nightingale.

It is stated that the Queen has not yet fixed the date on which she will unveil a memorial tablet to Florence Nightingale in the crypt of St. Paul's Cathedral. It is anticipated that the ceremony will take place some time this month. The Committee which had in hand the erection of the statue in Waterloo-place had a small sum of money left over, and it was decided to utilise it in the form of a memorial in St. Paul's, to the erection of which the Cathedral authorities readily gave their consent.

Glasgow Building Trade.

The annual meeting of the Master Masons' and Brickbuilders' Association of Glasgow and neighbourhood was held recently in the Building Trades Exchange, Buchanan-street, Glasgow. Mr. John Train, President, was in the chair. The membership of the Association, it was stated, was ninety-eight, as compared with ninety-nine in the previous year. The financial statement showed a balance at credit of the Association of £245 as compared with £189 at the end of 1914.—Mr. John Train was re-elected President, Mr. J. Scott Inglis Vice-President, and Mr. William Muir Treasurer. The negotiations which had taken place during the year with a view to the adoption of a national mode of measurement were explained. A letter was submitted from Mr. A. K. Smith, one of the surveyors, who has been taking part in the negotiations, stating that some points about stone measurement had to receive final adjustment with quarry-masters, and that he trusted to be in a position to call a meeting of the sub-committee representing the trade at an early date. It is expected that the mode of measurement will be completed shortly.

The Surveyors' Institution.

The following have been successful in passing the Preliminary Examination, 1916:—

H. Anthony, Llanelly, S. Wales
F. H. Astill, Leicester
S. E. L. Bendall, Wells, Somerset
* G. A. Blanchard, East Croydon
H. F. Brewster, London
P. A. Cadman, Scarborough
J. K. Carless, Richmond, Surrey
H. A. Coningsby, London
A. G. Evans, Chepstow, Mon.
J. D. T. Eve, Bedford
E. J. Finzi, London
J. B. Florance, Olton, Warwickshire
L. T. Hinnell, Alderley Edge, Cheshire
N. C. Kemp, Kings Norton, Worcestershire
C. N. L. Lomax, Northwood, Winchester
G. E. Maynard, London
F. D. Metherell, London
R. H. Mumford, Forest Gate
J. T. Page, Ludlow
F. R. Ragg, Derby
A. B. Smith, Cheshunt
R. Sykes, Golcar, near Huddersfield
R. E. Tatham, Kirkby Lonsdale
P. H. Thomas, Carmarthen
J. R. Toovey, Watford
P. W. Turner, Mansfield, Notts.
E. A. Ward, Newton St. Cyres, Devon
J. W. Ward, Bere Alston, Devon
E. G. L. Williams, Didsbury, Manchester
J. C. Williamson, Oswestry.

Scottish Candidates.

J. S. W. Farrer, Annan
H. G. Kerr, Dalry, Ayrshire.

---

* Head of list.

The Kaiser's Villa.

Telegraphing on the 27th ult. from Corfu, the *Petit Parisien* correspondent says:—"I visited yesterday Achilleion, the Kaiser's villa. It is needless to describe this work of art, or the bad taste shown in the Berlin handling of this Italian style residence, or the Imperial bath-room, where the statues are so arranged that they seem to be washing their feet in the water, or the colossal statue of Achilles, of a chocolate zinc colour, erected in the gardens with an inscription proclaiming William II. as the Emperor of the world."—Exchange.

Louis Raemaekers's Cartoons.

These cartoons left this country, we believe, on Tuesday, in order that they may be exhibited in Paris contemporaneously with the festivities arranged in the artist's honour in that city by the State, the City of Paris, and the artists. To meet this withdrawal and to avoid a break in the continuity of the exhibition at the Fine Art Society's Galleries, it has been arranged to exhibit a series of reproductions in colour facsimile of the cartoons which have the artist's imprimatur. One hundred of these facsimiles will be used for a volume entitled "A Neutral's Indictment," which the Society will shortly publish in a limited edition.

The Military Cross.

Temporary Second-Lieut. Arthur Michael Durrant, 8th Battalion, Loyal North Lancashire Regiment (attached 171st Tunnelling Company, Royal Engineers), has received the Military Cross for conspicuous gallantry and resource near Frelingheim on December 23, 1915. When a charge placed by our miners in the German gallery had only partially exploded and warned the enemy, Second-Lieut. Durrant, with two other officers, succeeded in placing and firing a second charge, which demolished the enemy's gallery. There was imminent danger throughout of the Germans exploding a mine. Lieut. Durrant is a member of the firm of Messrs. Moore-Smith & Durrant, of Union-court, Old Broad-street, E.C., and is an Associate member of the R.I.B.A.

A Plea for Museums.

At a general meeting of members of the Three Arts Club the following resolution was passed unanimously:—"That this meeting of members of the Three Arts Club, while recognising the need of economy in the national interest, regrets the decision to close picture-galleries and museums, being of opinion that in the present time of national stress it is undesirable to diminish opportunities for rational recreation, especially in view of the fact that so many of our Colonial fellow-subjects are now having their only opportunity of seeing some of our national treasures; and also because, in the case of the museums, the instruction there to be obtained is an invaluable national asset, worth more than the comparatively small monetary and other saving to be effected by closing the buildings to the public."

The New "Star and Garter."

The greater portion of the "Star and Garter" Hotel at Richmond has been pulled down, and in its place there will soon be erected a Home of Rest for Disabled Soldiers. The new building is designed by Mr. G. Gilbert Scott, F.R.I.B.A. The building will be a long, low structure, something in the style of an Italian palace. The bricks will be grey, and there will be an Italian roof. When the part which will be situated on the site of the demolished hotel is completed the annexe will be pulled down and the rest of the building erected on its site. The grounds will be made into Italian gardens; accommodation will be provided for 300 totally helpless men. Each man will occupy his own room, and there will be a central ward for those who need special attention. There will be a dining-room for such of the inmates as can use it, and suitable recreation and reading rooms. Access to the gardens and terrace and the extensive loggia will be made easy by lifts.

Captain Law.

We are informed that Second-Lieut. C. Orlando Law, Licentiate R.I.B.A., M.S.A., has recently been promoted to the rank of Captain, R.E.

Restoration of Ancient Building near Holyrood Palace.

At the Edinburgh Dean of Guild Court recently warrant was granted to Mr. George Dalziel to make alterations at 3–11, Abbey Strand, Holyrood. This is a building of some historical interest, and it is believed that the original part of the erection is some 250 years old. Many of its ancient features have been obliterated and spoiled, and the intention is to have it restored to its original condition externally. The work, which is to be carried out under the advice and supervision of Dr. Thomas Ross, architect, will consist of taking out the two top stories, thereby lowering the height of the building, and restoring a series of dormer or pedimental windows of masonry construction.

The "Empire Directory."

We have received the "Sanitary Record and Municipal Engineering Empire Directory and Year-Book" for 1916. The leading features of this year's edition, which is the thirty-fourth issue, include a list of new officials and municipal undertakings; a key for easy reference to every city and town in the United Kingdom; and the addition of various sections to the editorial portion, such as Municipalities and Motors, Engineering and Building Construction, Fire Prevention, Lighting, Heating, and Ventilation, and Sanitation. The section devoted to Road and Road-making, which has always been a distinctive feature of this publication, has been much amplified. The book is published at No. 8, Bream's-buildings, Chancery-lane, E.C.

Town Planning in Madras.

The following is the synopsis of the course of lectures delivered by Mr. H. V. Lanchester, Town-planning Adviser to the Madras Government, on Town Planning at the Madras Engineering College:—(1) "The Ethics of Town Planning," (2) "Civic Survey Methods," (3) "The Economics of the Civic Survey," (4) "Historical Study of Town Planning," (5) "Tradition and City Development," (6) "City Life and Housing," (7) "Commerce and Traffic," (8) "Contrasts—European and Indian Cities," (9) "Problems in India," (10) "The Uses of the Town-Planning Act," (11) "The Technique of City Improvement," (12) "Madras City." In this connection the Government of Madras issued an order in which municipal councils were requested to depute their engineers of different grades to attend the lectures, the order applying also to district boards. Special railway concessions were to be made in connection with those who attended the lectures from any distance.

London County and Westminster Bank, Ltd.

Mr. Walter Leaf, Deputy Chairman, presided at the annual ordinary general meeting of the London County and Westminster Bank, held on Thursday last week. He remarked that from the point of view of their deposits and their gross profits the year would appear to have been one of great prosperity. But they must not allow themselves to forget the underlying fact that this prosperity was really fictitious, being based on the using up of their savings in the past and that for every individual in the nation there was a paramount duty to save—to save to the uttermost in order to stop, and when the time came to replenish, the terrific drain upon our accumulated wealth which was implied in the unparalleled effort to which the nation had braced and was bracing itself. He went on to mention that no fewer than 1,000 of their staff had been released and were on active service, that 1,100 more had been attested, and many of them had already joined the colours. Practically the whole of the eligible staff had in one way or another offered itself. To their deep regret they had to record that they had lost thirty killed and eighty-two wounded.

HE ROYAL INSTITUTE OF BRITISH ARCHITECTS:

THE EXAMINATIONS.

HE Preliminary Examination, qualifying for istration as Probationer R.I.B.A., was held London and Manchester on November 23 l 28. Of the thirty candidates admitted enteen were exempted from sitting, and the naining thirteen were examined, with the owing results :—

Centre.	Examined.	Passed.	Relegated.
London	8	6	2
Manchester	5	4	1
	13	10	3

he following passed and exempted candies—numbering altogether twenty-seven—e been registered as Probationers :—

R. Acton, Rainbow Hill, Worcestershire
H. Adams, London
M. Austin, London
E. Broad, Croydon
F. D. Calthorpe, tonehouse, Plymouth
Campbell, Blyth
C. Chandra, Bombay
E. Chicken, Belve- ere, Kent
S. Dixon, London
C. Fagg, London
C. Gibson, Swansea
C. Henriques, Lon- lon
De H. Hutton, Lon- lon
L. Jenkins, Bridg- nd, Glam.
J. S. Kwok, London
J. Mather, Harpurhey, Manchester
W. Park, Moseley, Birmingham
A. L. Priest, Adamsdown, Cardiff
R. V. Roberts, Derby
W. G. Seaton, Pontypridd
D. J. Simpson, Bristol
L. F. Smith, Derby
A. W. Stewardson, Carlisle
E. Sutcliffe, Todmorden, Yorks
N. B. Weekes, Liverpool
A. J. West, Blackburn
R. Whitworth, Reading

Intermediate.

he Intermediate Examination, qualifying registration as Student R.I.B.A., was held London and Manchester from November 19 November 26. Fourteen candidates were mined, with the following results :—

Centre.	Examined.	Passed.	Relegated.
London	9	4	5
Manchester	5	3	2
	14	7	7

he passed candidates who have been istered as Students are as follows, the names ng given in order of merit as placed by the aminers :—

O. H. Davies, Lon- lon
W. L. Roberts, Bredbury, near Stockport
W. H. Bowman, Pendleton, Manchester
G. W. H. George, Swindon
A. Gray, Hertford
O. A. Roff, Sheffield
J. T. Stone, London

Exemptions from the Intermediate.

The following Probationers, having produced satisfactory evidence of their training and qualifications, were exempted from sitting for the Intermediate Examination and have been registered as Students :—

E. C. Henriques, London.
L. De H. Hutton, London.

In accordance with the special concession granted by the Council to Probationers serving with the Forces who are eligible for the Intermediate Examination and whose Testimonies of Study have been approved, the following were also exempted :—

J. R. Ashworth, Accrington (Lieut. 5th Bn. East Lancs Regiment)
E. A. Bell, Leeds (Corporal, York Hussars)
H. W. Couchman, Tottenham (153rd Battery, Royal Garrison Artillery)
T. A. Dryden, Sketty, Glam. (University of London O.T.C.)
R. R. Gaskell, Hull (1/1 East Riding Field Company, Royal Engineers)
G. E. A. Greensill, Cannock, Staffs (Birmingham City Bn., Royal Warwick Regt.)
R. T. Grummant, London (Artists' Rifles)
A. O. Hector, Tilford, near Farnham (Corporal, Princess Patricia's Canadian Light Infantry)
H. Jones, Wingrave, near Aylesbury (19th Bn., Royal Fusiliers)
S. Lee, Newland, Hull (Royal Garrison Artillery)
J. H. Lumb, Heworth, York (1/6 2nd London, Royal Engineers)
T. M. Morgan, Aberdare (Inns of Court O.T.C.)
W. G. Norris, London (68th Coy., Army Ordnance Corps)
K. Palmer, Levenshulme, Manchester (Royal Army Medical Corps)
N. R. Paxton, Langside, Glasgow (Glasgow University O.T.C.)
D. S. Prosser, Llanishen, near Cardiff (Inns of Court O.T.C.)
A. I. Richards, London (Inns of Court O.T.C.)
C. D. St. Leger. Cosham, Hants (2nd Lieut., 13th Hampshire Regiment)
R. R. Shipley, Gateshead-on-Tyne (2nd Lieut., 63rd Northumbrian Division, Royal Engineers)
C. W. Smith, London (Artists' Rifles)
T. O. Thirtle, Harrow (Royal Army Medical Corps)
L. J. Williams, Penzance (2nd Lieut., 2/5 Bn. Duke of Cornwall's Light Infantry)

Final and Special.

The Final and Special Examinations, qualifying for candidature as Associate R.I.B.A., were held in London from December 2 to December 10 Of the twenty-nine candidates admitted to the Examination, ten passed, and the remaining nineteen relegated in various subjects. The successful candidates were as follows :—

C. C. Cheek, London
H. Colbeck, London
C. H. Gale [*Special*], Hillhead, Glasgow
A. B. Hamilton, London
C. E. Hill, Sheffield
J. V. Hull, Garstang, Lancs
C. S. Picton, London
H. P. Rainger [*Special*], Cheltenham
H. W. Rough [*Special*], London
G. Vinden, Reading

The number of failures in each subject of the Final Examination was as follows :—

A.	Design	8
B.	Construction—	
	(1) Foundations, Walls, Roofs, etc.	12
	(2) Iron and Steel	14
C.	Hygiene	11
D.	Properties and Uses of Building Materials	6
E.	The Ordinary Practice of Architecture	11
F.	The Thesis	2

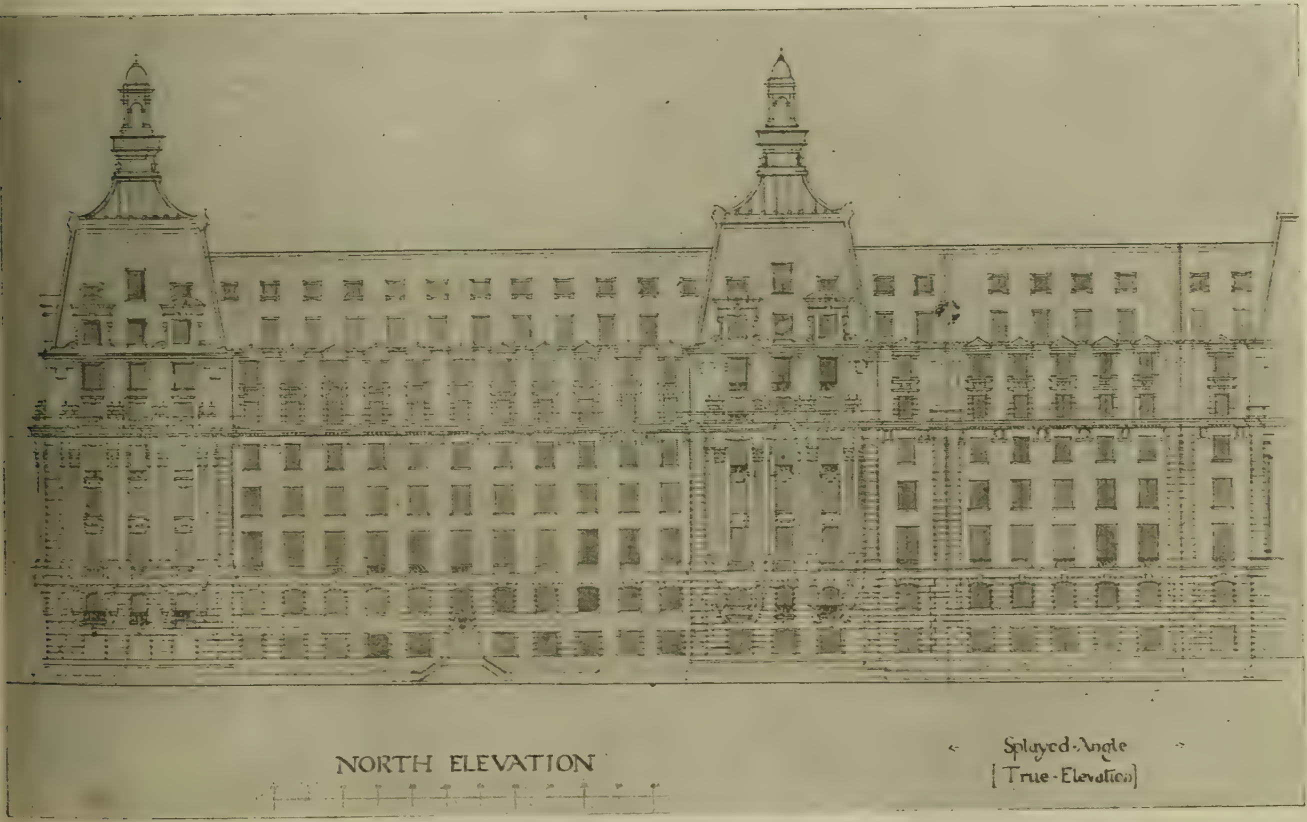
The Ashpitel Prize, 1915.

On the recommendation of the Board of Architectural Education, the Council have awarded the Ashpitel Prize for 1915 to Mr. Percy Joyce Adams, of "Fairmead," Woodside-road, Woodford, Essex (Probationer, 1906; Student, 1911; passed the Final Examination July, 1915), he being the candidate who has most highly distinguished himself in the Final Examinations held in 1915.

◆

ROMAN LONDON.

Mr. F. Lambert, M.A., of the Guildhall Museum, lectured before the Bishopsgate Ward Club recently on "Recent Roman Discoveries in London." Dealing first with the excavations made at Leadenhall Market in 1880–81, he showed drawings of the Roman remains then discovered, and said that a solid brick pier of Roman construction is still to be seen in the basement of a hosier's shop in Gracechurch-street. It is the more interesting as being probably the only piece of the solid brickwork of that era extant in this country. It measures 10 ft. by 6 ft., and is 3 ft. or 4 ft. high. Mr. Lambert touched briefly upon the recent discoveries under the crypt of St. Mary-le-Bow and below the cleared site in Finsbury-circus.



Board of Trade Offices: Competition Design.

ILLUSTRATIONS.

St. Clement Danes and St. Edmund King and Martyr.

WE reproduce these two plates from "The Churches of Sir Christopher Wren," by J. Clayton, which was published by Messrs. Longmans, Green, Brown, & Longmans in 1848, and which we give by the courtesy of Messrs. Longmans, Green, & Co. Further notes on these churches will be found on page 101.

Design for Board of Trade Offices.

WE reproduce the elevations of the design submitted for the new Offices of the Board of Trade by Mr. W. A. Pite, as we consider the type of design adopted to be both interesting and unusual in these days when architects are adhering more and more to academic classical renderings.

Aspley Heath Lodge.

WE illustrate a very pleasing example of Messrs. Adams & Holden's domestic work in the form of a lodge.

A Campo Santo on the Banks of the Marne.

THE illustration shown in this issue is a sketch design for a war memorial, in the form of a campo santo, to those of the British Army who fell in the historic Battle of the Marne, which threw back the Prussian advance on Paris in 1914. The French nation has already erected a fine obelisk on the site of the battlefield, and a scheme on the lines of Mr. Richardson's sketch, embodying an English cemetery, is well within the range of practical politics.

MEETINGS.

FRIDAY, FEBRUARY 4.

Town Planning Institute.—Mr. Seebohm Rowntree on "The Town Planning Proposals of the Urban Land Report." 8 p.m.

SATURDAY, FEBRUARY 5.

Provident Institution of Builders' Foremen and Clerks of Works.—Annual dinner (in the King's Hall, Holborn Restaurant). 5.30 for 6 p.m.

MONDAY, FEBRUARY 7.

Surveyors' Institution.—Mr. C. F. Slater (Fellow) on "Dilapidations—Some Notes and Suggestions." 5 p.m.

University Extension Lecture (at the Victoria and Albert Museum).—Mr. Banister Fletcher on "English Renaissance and Modern Architecture." 4.30 p,m.

Royal Society of Arts.—Rev. Dr. Herbert West, D.D., A.R.I.B.A., on "Flemish Architecture." Lecture I.: "National and Historic Buildings in the War Zone." 4.30 p.m.

TUESDAY, FEBRUARY 8.

Institution of Civil Engineers.—Paper by Mr. Wm. Theodore Lucy, M.Inst.C.E., entitled "Notes on the Working of a Rack Railway," for discussion. 5.30 p.m.

WEDNESDAY, FEBRUARY 9.

Carpenters' Company.—Mr. Arthur Gardner on "Sculptures of Reims Cathedral." 7.45 p.m.

University of London, University College.—Professor Adshead on "The Sculptural Attributes of War Memorials." 5.30 p.m.

THURSDAY, FEBRUARY 10.

University Extension Lecture (at the British Museum).—Mr. Banister Fletcher on "The Colosseum, Rome." 4.30 p.m.

Institution of Electrical Engineers.—Mr. O. L. Record on "The Testing of Underground Cables with Continuous Current." 8 p.m.

CORRESPONDENCE.

Wren's Churches.

SIR,—The interesting and valuable drawings of two destroyed Wren churches published in your issue of the 14th ult., following directly upon the suggestion *re* the St. Paul's model on page 14 of your previous issue, have brought vividly into my mind a scheme which, if hardly practicable just at present, might be carefully considered in anticipation of a time when we may again bend our energies to the things of peace.

It is this: that either as an adjunct to the Victoria and Albert Museum, or as an independent institution, a stately room should be dedicated to the perpetuation and display of those designs of Wren which cannot be studied as actual buildings. In the centre of the room would stand the restored model of the First Design for St. Paul's, and round it would gradually grow up a collection of large-scale models of those destroyed Wren churches of which complete drawings are extant. On the walls would hang all the best drawings and prints of these churches that could be obtained. The models would be made as realistic as possible so as to appeal to the half-trained eye, and the drawings would include new perspectives of all those buildings not represented in the solid. If only a gradual introduction of exhibits was attempted, and a suitable home for them could be found in an existing building, no heavy expense would be involved, and doubtless some drawings and even models would be given as free-will offerings.

To those who have diligently explored the wide field of Wren's genius, the desirability of such a collection, worthily housed, needs no emphasising; but it is well that the arguments in favour of it should be distinctly set forth. They may, I think, be enumerated as follows:—

1. It is due from us as an act of penitence and slight reparation for our national sins against the beauty of London.

2. It is due also as a completion of the monument to Wren for which we can "look around" in St. Paul's and his other extant works; and surely a complete monument is needed to one who combined sound practical building with mathematical science and a keen sense of beauty.

3. It would (especially if attached to a well-known museum) reveal to a large section of the public the character of our loss from the destruction of eighteen Wren churches, and thus help to safeguard those which remain.

4. It would be of great interest and value to architectural students and architects generally.

5. It would strengthen the historical records of bygone London, and—if I may indulge in prophetic dreams—make easier, in an age when art shall have come to its own, the reconstruction on their original sites, or even on new ones, of some of those unique conceptions which a grosser age has laid low.

Croydon. LINDLEY LATHAM.

Liverpool Monuments.

SIR,—Referring to your interesting article on "Liverpool Monuments," a sentence on page 62 of January 21—"the familiar green-stained white of the Portland pedestal under a bronze figure"—made me think of "Clive," in Whitehall, and other examples. I write to ask would it not be possible for the sculptor or his architect to arrange a drain round the top of the pedestal with a down pipe drilled through the heart of the Portland stone block to prevent this? G. DAVIDSON (Major, R.E.).

Re Painters' Rates of Wages.

SIR,—I shall esteem it a favour if you w kindly give the following statement a space the columns of your journal.

On August 23, 1913, the House Painters a Decorators of London came out on strike f the purpose of securing an advance of wag amounting to 1½d. per hour, together with code of working rules. The total number men leaving work was roughly between 18,0 and 20,000.

After a period of four weeks, during whi time they were in negotiation with th employers, they accepted an advance of wag amounting to 1d. per hour on the rates th existing of 8½d. and 9d., making the new rat 9½d. and 10d. per hour. Some questions we submitted to the Board of Trade on poin of working rules, and on October 2, 191 Mr. Benjamin Francis Williams, K.C., gave a award in which the 1d. per hour increase w embraced.

Owing to the hostile attitude of the Lond Master Builders' Association, the followin important spending authorities have agre to stipulate in their contracts with build and other employers of labour that painte minimum rate of 9½d. per hour must be paid :-

Government work—all departments.
The London County Council.
The Metropolitan Asylums Board.
Metropolitan Borough Councils numberin eighteen.
Urban and District Councils within t twelve-mile radius, five.
Boards of Guardians numbering twelve.

In addition a large number of busine houses have taken similar steps to prote the workmen, and our revised Fair Firm list at present contains the names of ov 500 competing firms in the painting, decoratin and building trade.

The refusal of the L.M.B.A., whilst offici is not general, seeing that a considerable numb do pay 9½d. whilst others pay 10d.

I therefore submit, sir, that the quotati of 9d. as tabulated in the *Builder* is incorre and trust that you will make such alteration will meet the case for the workmen concerne

JOHN BANCROFT,

National Amalgamated Society of Operati
House and Ship Painters and Decorators.

FIFTY YEARS AGO.

Permanent Sun-Printing in Oil Colours and Printer's Ink.

THE ingenious process of Mr. John Pounc of Dorchester, whereby the sun is made print photographs from ordinary negative upon paper prepared with sensitised printe ink, has already been more than once favou ably noticed in the *Builder*. Mr. Pounc is still making advances on his original id of the carbon process for the attainment the great desideratum of truly permane photographs. He now prints, by his printe ink and oil colour processes, on ceramic war the photographs being thus burnt in up the ware; and is also experimenting wood for decorative panels, as well as f engraving blocks. The pictures are tran ferred either to wood for panels, etc., or lithographic stone for ordinary lithograph printing, by simple means; and really t effects, especially in the form of lithograph are excellent, though not so fine, of cours as his photographs themselves, which w admit of even microscopic examinatio The transfers to wood may be said to still in an immatured state; but they promi well, whether for decorative panels or f the engraver. For panels (as for ceram ware also, we presume) the photograp may be taken in his sensitised oil colou (green, blue, red, etc.) as well as in ordina printer's ink sensitised. A specimen of M Pouncy's sun-printing in printer's ink ma be seen at the *Builder* office.

[*** We give the above extract from t *Builder* of February 3, 1866.—ED.]

LEGAL SECTION.

IOTES ON CURRENT CASES.

Hart *v.* Rogers :
Liability of Owners of Flats for Repairs.

IN the case of Hart *v.* Rogers, which was tried by Mr. Justice Scrutton on December 3, 1915, the plaintiff claimed £115 9s. 6d., vo quarters' rent of a suite of furnished rooms Moscow Mansions, Cromwell-road. A term the tenancy agreement was that £20 was to paid for dilapidations at the end of the nancy. The defendant (the tenant) alleged at the plaintiff (the owner) retained control the roof of the premises, and that, owing to s neglect to repair it, water came through to the flat and rendered it unfit for human abitation, and that, as a consequence, his ife became ill, and he had to find another ouse during the period claimed for. He also ounterclaimed for damages in respect of s wife's illness.

Mr. Justice Scrutton held that the roof was nder the control of the landlord, and it was ot included in the letting to the tenant, and at the defect which caused the damage was ot in a part of the roof included in the demise. being clear that ordinarily the lessor of an nfurnished house does not impliedly warrant at it is fit for occupation, but that the lessor a furnished house or apartments does npliedly warrant that it is fit for human cupation at the beginning of the tenancy, e question arises—What is the legal position cases where the landlord retains in his own ossession and control something essential the enjoyment of the premises demised, such a staircase or a roof ?

In Carstairs *v.* Taylor ([1871] L. R. 6 Ex. 217), hich is still the leading case on such questions, e plaintiff hired of the defendant the ground oor of a warehouse, the upper part of which as occupied by the defendant himself. The ater from the roof was collected by gutters to a box, from which it was discharged by a pe into the drains. A hole was made in the ox by a rat, through which the water entered e warehouse and damaged the plaintiff's oods. The defendant had used reasonable re in examining and seeing to the security the gutters and the box. In an action by e plaintiff against the defendant for the mage so caused it was held that the defendant as not liable, either on the ground of an implied ntract or on the ground that he had brought e water to the place from which it entered the rehouse.

Chief Baron Kelly said it had been argued at the defendant was liable on the ground her of contract or of a duty imposed by law. is unnecessary to consider whether, as tween landlord and tenant, where the ndlord is in possession of the upper floor d the tenant of the lower, there is an implied ntract by the landlord so to maintain the rt of the premises in his possession as not permit damage to happen to the tenant rough any ordinary causes. Assuming that ere is such an implied contract, or assuming at, independently of the relation of landlord d tenant, there is a duty on the owner d occupier of the upper part of a house so manage and keep it as to prevent the ppening to the occupier of the lower floor accidents through ordinary causes the intiffs would not be entitled to recover, since complete performance of any such contract duty would not have guarded against the schief in question. It was not that the fendant left the roof out of repair, or did act directly occasioning the passage of the ter, but the cause of the mischief was that rat had shortly before the accident eaten way through the box into which the gutters charged themselves, and made a hole through ich the water poured into the warehouse. arly, there was no duty on the occupier ove, whether he be landlord or only occupier, guard against an accident of this nature. It absurd to suppose a duty on him to exclude the possibility of the entrance of rats from without.

Baron Bramwell said the defendant made a gutter of such a shape, character, and direction that when the hole in question had been made the water poured into the plaintiff's premises. The defendant conducted the water to the place whence it escaped, and he may therefore be said, in a sense, to have poured the water on to the plaintiff's premises, which is more accurate than to say that the water escaped, or to use any other expression which speaks of the water as though it were an active agent. Suppose, he said, that an ordinary cistern were pierced by a stranger, and the water in consequence escaped, the proximate cause of the accident would be the act of the person who pierced the cistern ; the owner of the cistern could not be said to have poured the water upon his neighbour's premises unless he afterwards filled the cistern. But the defendant here has conducted the water to the place from which it poured on to the plaintiff's premises, and he may therefore be said to have poured it on to them. So far, the case resembles Rylands *v.* Fletcher, but there is a material difference between the cases. In Rylands *v.* Fletcher the defendant, for his own purposes, conducted the water to the place from which it got into the plaintiff's premises. Here the conducting of the water was no more for the benefit of the defendant than of the plaintiff. If they had been adjacent owners it would have been for the benefit of the adjacent owner that the water from his roof was collected, and the case would have been within the decision in Rylands *v.* Fletcher ; but here the roof was the common protection of both, and the collection of the water running from it was also for their joint benefit, and the plaintiff must be taken to have consented to the collection of the water which was for their own benefit, and the defendant can only be liable if he was guilty of negligence. Is there, then, any evidence of negligence ? It is said there was negligence in so constructing the box that if a hole were made in this place the water would enter the warehouse. But how can it be said that there was negligence when it was constructed in the way in which such things are ordinarily constructed ? When it is repaired it will probably be repaired in such a way that the accident cannot occur again ; but to treat this as evidence of negligence is to say that whenever the world grows wiser it convicts those that went before of negligence. It is said that rats can be easily got rid of out of a warehouse ; but, assuming it to be so, it is no negligence not to take means to get rid of them till there is reason to suppose they are there, and it cannot be said that persons ought to anticipate that rats will enter through the roof by gnawing holes in the gutters.

Baron Martin delivered a similar judgment, and said that a person who takes a floor in a house must be held to take the premises as they are, and cannot complain that the house was not constructed differently. Probably the defendant was under a liability to use reasonable care in keeping the roof secure, but he cannot be held responsible for what no reasonable care and vigilance would have provided against. He cannot, certainly, be considered guilty of negligence, for he caused the roof to be examined periodically, and it was, in fact, examined and found secure only four days before the occurrence complained of. He had acted with care, and performed the whole of the duty that was cast upon him. As to the duties implied by law, the true rule was laid down in the year 1681 in Paradine *v.* Jane : "Where the law creates a duty or charge, and the party is disabled to perform it without any default in him, and hath no remedy over, there the law will excuse him ; as in the case of waste, if a house be destroyed by tempest, or by enemies, the lessee is excused, but when the party, by his own contract, creates a duty or charge upon himself he is bound to make it good, if he may, notwithstanding any accident by inevitable necessity, because he might have provided against it by his contract." That rule, in his opinion, was an answer to the plaintiff's claim.

The case of Hargroves *v.* Hartopp ([1905] 1 K. B. 472) also deals with the liability of the landlord for damages caused by disrepair of a roof. The plaintiffs were tenants of a third floor in a building which, in this part of the premises, was the highest floor. A rain-water gutter in the roof, the possession and control of which was retained by the landlord, the defendant, became stopped up by an accumulation of rubbish, the greater part of which had been thrown by the tenants of the floor above on to the roof below. Notice of the stoppage was given by the plaintiffs to the defendant, but the defendant neglected to have the gutter cleaned out till after the lapse of four or five days from the receipt of the notice, and in the meantime considerable damage had been done to the plaintiff's goods in consequence of the rain-water flowing into their premises. Neither the roof nor the gutters or rain-water pipes were demised by the defendants, but were retained by them in their possession and control. The defendants had never caused the gutters and pipes to be periodically examined and cleaned out, and the rubbish which caused the stoppage of the gutters was the accumulation of years. The court held that the fact of the gutter being under the control of the defendant imposed upon him a duty to take care that it was not in such a condition as to cause damage to the plaintiffs, and that, as he had notice of its being stopped up and neglected to clear it out within a reasonable time after the receipt of the notice, they were guilty of a want of due care, and were consequently responsible for the damage done.

The late Lord Chief Justice Alverstone, in giving the judgment of the Divisional Court upon an appeal from a decision of the County Court judge in favour of the plaintiffs, said that they upheld the decision of the County Court judge. The roof was not demised to the plaintiffs, and neither they nor any of the tenants had any right of access to the roof, nor, in fact, had they ever repaired it or cleaned out the gutter. The damage complained of happened as the result of a gutter in the roof becoming stopped up in October. The plaintiffs gave the defendant notice of the leakage, but the defendant delayed five days before taking steps to have the stoppage removed, and the County Court judge found that there had been a previous leakage in the roof in the preceding July, that the gutter was not clean on the occasion, and that the defendant had never inspected the gutters at any time. He held that, under those circumstances, the defendant was liable for negligence in not periodically inspecting the gutters, and in not acting sufficiently quickly after receipt of the plaintiff's notice in October. It may be, he said, that a covenant by the landlord to repair is not to be implied in respect of those portions of the premises which are actually demised to the tenant, but that was not the case. Here the gutter was not demised, and the question was whether, under those circumstances, the landlord is not under a duty to take reasonable care to prevent a gutter which is under his control from becoming stopped up, whereby damage may happen to the occupants of the floors below. He thought there was, and that, there being evidence of a failure to discharge that duty, inasmuch as the defendant never inspected the gutters, and delayed the repairs even after receipt of the notice, he was liable for the damage which ensued. Even if it were true, as contended, that in such a case no duty to take care can arise, independently of covenant, except in respect of acts of commission, he thought that here the defendant was guilty of an act of commission. A person who maintains an artificial thing like a gutter, used for the very purpose of carrying off the rain-water from the roof, in an improper condition after notice, may be said to be guilty of an act of commission, and he was, in his opinion, under a duty to take care that as a result of that act no damage happened to the occupants of the house. He doubted whether the language of the judges in Miller *v.* Hancock could be supported when they seemed to suggest that the duty which is to be implied in such a case is co-extensive with that which is created by an express covenant—that is to say, that it is an absolute duty to keep the premises in a safe condition at all events, and not merely a duty to take reasonable care to keep them safe.

The cases quoted above refer to the liability of the landlord in respect of a roof which is kept under his control. That of Miller *v.* Hancock ([1893] 2 Q. B. D. 177) illustrates the same principle when applied to a staircase under similar conditions. The defendant was the owner of a building in the city, the different floors of which were let by him separately as chambers or offices, the staircase, by which access to them was obtained, remaining in the possession and control of the defendant. The plaintiff, who had, in the course of business, called on the tenants of one of the floors, fell, while coming down the staircase, through the worn and defective condition of one of the stairs, and sustained personal injuries. The plaintiff sued the defendant in respect of the injuries, and the Court of Appeal held that there was by necessary implication an agreement by the defendant with his tenants to keep the staircase in repair, and, inasmuch as the defendant must have known and contemplated that it would be used by persons having business with them, there was a duty on his part towards such persons to keep it in a reasonably safe condition, and the action by a stranger was therefore maintainable.

Lord Esher, M.R., said the defendant was the owner of a building consisting of several floors, and the rooms on the first and second floors respectively were let as separate tenements to different tenants. He did not let the staircase, which was the only mode of access which the tenants had to their respective tenements, and it therefore remained in his possession and control. The right of the tenants to use the staircase under such circumstances might be called an easement; but it was, in his opinion, such an easement as the landlord was bound to keep so as to afford a reasonably safe entrance and exit to the tenants. It seemed to him that there was an implied obligation on the part of the landlord to the tenants to that effect, or else he was letting to the tenants that which would be of no value to them. What, he asked, is the use of a second floor to any one if the staircase by which alone there can be access to it is to be allowed to go to ruin? Furthermore, it was obvious that in such a case the landlord must know that the premises so let would be of no use to tenants unless those who supply or deal with the tenants—such as tradesmen or others having business with them—also have access to the premises. Under those circumstances he thought that there was a relation between the landlord and those who resorted to the premises for business purposes, from which a duty arose on the part of the landlord to keep the staircase, which is the means of access to the premises, in reasonably safe repair. In the case of Smith *v.* London and St. Katherine Docks Company the defendants, a dock company, provided gangways as a means of access to ships lying in their docks in the ordinary course of business. There was therefore an implied contract to provide the gangways not only for the use of the crew but also for other persons having business with the ships. The Court, in that case, said that the defendant must have known that they would be used by such persons, and, that being so, there was a duty on their part towards persons, between whom and them there was no other relation than that created by going on board the ship on business, to have such gangways in a safe condition. Similar reasoning appeared to him to apply to the present case.

Lord Justice Bowen, in his judgment, said the plaintiff was a collector for a railway company who had, in the course of business, called upon the tenants of one of the flats, and who, in coming down the staircase from their premises, fell down through a defect in the stairs, and broke his leg. The liability of the landlord appeared to him to be clear, both on reason and authority. He let the flats to tenants, but kept the staircase in his own occupation and under his own control. The tenants could only use their flats by using the staircase; the defendant, therefore, when he let the flats, impliedly granted to the tenants an easement over the staircase, for the purpose of the enjoyment of the flats so let. The defendant contended that, according to the common law, the person in enjoyment of an easement is bound to do the necessary repairs himself. That may be true with regard to easement in general, but it is subject to the qualification that the grantor of the easement may undertake to do the repairs either in express terms or by necessary implication. This is not the mere case of a grant of an easement without special circumstances, and it seemed to him that it would render the whole transaction inefficacious and absurd if an implied undertaking were not assumed on the part of the landlord to maintain the staircase so far as might be reasonably necessary for the enjoyment of the demised premises. From this it followed that the landlord had given the tenant a right to use the staircase, and had himself undertaken to keep it in repair. He knows, too, that persons who have business with the tenant will be coming up and down the stairs, and those persons will use the stairs on the understanding that they may lawfully do so, and that, in doing so, they would be shielded by the responsibility of the person on whom the liability to repair the staircase rested, and a duty was imposed by law upon the landlord towards using the staircase in the course of business with the tenants to keep it reasonably safe.

LAW REPORTS.

OFFICIAL REFEREE'S COURT.
(Before Mr. POLLOCK.)

Claim under a Lease: Collins *v.* Knowles.

MR. PERCY ALFRED COLLINS, of Uxbridge-road, Ealing, and Mr. Hugh de Pinquet Collins, of Poplar Farm, Cransford, Suffolk, on Tuesday, January 18, claimed from Mr. Guy Knowles, of Park Lodge, Albert-gate, Knightsbridge, in respect of rent and repairs at the determination of a lease of premises at Scrubb's-lane, Hammersmith. By lease dated March, 1904, the defendant took a factory and two dwelling-houses of the plaintiffs. The premises were new, having only been built in 1900, and therefore, said counsel, were presumably in good repair at the time the defendant took them. The defendant, in accordance with the terms of the lease, determined the tenancy in March, 1914, having sub-let them to Idris Carr, Ltd., and it was alleged against them that they had not kept them in proper repair, and that at the time they gave up possession there were due £91 for a quarter's rent and £29 15s., being double rent for the period during which they remained (from March 24 until April 9) after their term expired. The defendants admitted the £91 for a quarter's rent, but disputed the claim for £29 15s., alleging that they were unable to complete the necessary repairs which were in progress by March, and that the plaintiffs had agreed to allow them to remain to complete, provided they held themselves responsible for accruing rent, but not for the double rent. The £91 for the quarter's rent was paid into Court.

The evidence as to the condition of the premises was conflicting, and the Referee, in the result, found for the plaintiffs, awarding them £220 18s., including the money paid into Court.

OFFICIAL REFEREE'S COURT.
(Before Mr. VEREY.)

Claim by Builders: Maurice Fisher & Co. *v.* Lipowski.

THE plaintiffs in this case were a firm of builders carrying on business at Rayleigh, in Essex, and they claimed £79 12s. 4d. for work done and money expended at the request of the defendant at Turret House in the village of Hockley, near Rayleigh. The work was done between November, 1914, and May, 1915, an four separate accounts were sent in to th defendant in respect of it, some for labou and others for materials. Payments o account were made from time to time, leavin the balance claimed. There was no contra in writing, but plaintiffs, through the counsel, said that the work was done upo instructions received verbally from the d fendant. The total amount for labour an materials was £229 12s. 4d., of which £1 had been paid, leaving the balance £79 12s. 4d. The defendant, on taking Turr House in October, 1914, was brought in touch with the plaintiff firm, and at first h only wanted some small repairs done, but a time went on his requirements were added t and he personally gave his orders to th plaintiffs, so that there were no letters written contract to be relied upon.

A considerable amount of evidence was take on both sides, and in the result the Refere found for the plaintiffs for £76 9s. 7d., wit costs.

CHANCERY DIVISION.
(Before Mr. Justice YOUNGER.)

Newcastle Builder's Motion: Mair *v.* Glennie.

HIS LORDSHIP on January 18 delivere his reserved judgment in a motion b the plaintiff in the case of Mair again Adam Glennie, for a writ of attach ment against Mr. Glennie for breach an injunction, whereby he was to refrain fro carrying on business by himself, his servant or his agents as a lift builder, engineer, millwright, or to be engaged or intereste directly or indirectly, in any firm or compa carrying on such types of business in Ne castle or within 20 miles of the Town Ha in that city during a period of ten years fro the date a partnership between the parties w dissolved. Mr. Glennie was also to refrain all respects from seeking to compete with th plaintiff, who carries on business in Newcastl

The action in which the injunction w granted was one brought by Mr. Mair, li builder, etc., of Newcastle, to restrain brea by the defendant of covenants contained the deed of dissolution of partnership, ar the injunction granted, so far as it went, w in the terms of the covenants contained in th deed. The circumstances of the defendant alleged contempt of Court were that M Glennie, who now carries on business as lift builder at Middlesbrough, was invited June last by the Architects' Department, Newcastle, of the Co-operative Wholesa Society, Ltd., for a lift to be installed premises of the Seaham Harbour Co-operati Society at Horden. He tendered, and w successful, hence these proceedings.

These circumstances of the case were ou lined by his Lordship in his judgment, and went on to say that the Architects' Departme at Newcastle was, in fact, carried on by a M L. G. Ekins, an architect in the exclusi employment of the Co-operative Wholes Society, and the department acted for t Seaham Harbour Society.

The premises at Horden (continued t Judge), where the lift was to be erected, we in fact, within the prohibited area, but wh Mr. Glennie tendered for the work he believ —and his Lordship thought he had reasonal ground for believing—that the premises we really 23 miles from Newcastle and therefo outside the area. It had not been suggest by Mr. Mair that the defendant was not un a *bonâ-fide* mistake on this point, and wh the mistake was pointed out to him he only at once recognised it and abandoned contract, but interested himself in securing contract for the plaintiff.

To commit the defendant to prison for su an unwitting breach of the injunction was, course, out of the question, and it would oppressive in the highest degree. The mot was, in fact, brought and pressed for anot purpose altogether. The plaintiff's case that, assuming Mr. Glennie did believe t the lift was to be placed at premises outs the prohibited area, and the building ow and lessee resided outside the area, it was a breach of the injunction to send in a ten to the owner's architect at Newcastle, a none the less because the tender was sent response to an invitation by the architect. other words, the plaintiff's view of the inju tion was that the defendant was thereby bo to refuse every offer of business of the k prohibited if the offer emanated from a per whether principal or architect, at an add within the radius.

his Lordship's opinion, Mr. Glennie's in this case, in communicating as he did he architect and making his tender, was lf, in the circumstances, no breach of the His only breach was that the lift which oceeded to construct was—although he ot know it—within the prohibited area. hat unwitting act of disobedience the lant ought certainly to be excused. He at, on the whole, the plaintiff had been hat oppressive in these proceedings, and would be done if no order was made on the motion or as to the costs.

The London Building Acts: District Surveyor's Fees.

the Tower Bridge Police-court on the lt. Mr. Gill gave his decision on a ons for the recovery of District Sur- s fees in respect of an irregular build- structure that had been removed.

summons was taken out by Mr. Bernard e, District Surveyor for Newington, t Mr. G. Warren, of 42, Harper-street, Kent-road, for the recovery of 15s., ct Surveyor's fees according to the le to the 1894 Act. The case was heard 13th ult., when evidence was given to ffect that the District Surveyor on 3, 1915, discovered that an irregular n building or structure, covering the of the yard in the rear of 42, Harper- had been erected by the defendant it notice to the District Surveyor. As uilding was entirely irregular, and no val under sect. 82 to the erection of the ng or structure had been granted by the n County Council, the District Surveyor equired it to be removed, and as the the defendant had removed it. An it for the fee was subsequently delivered endant. The points that Mr. Gill was lly called upon to decide were whether the ct Surveyor was the proper person to the irregular building or structure to be ed, and whether the building or struc- having been removed, instead of being led to comply with the Act, the District vor was entitled to the fee according to hedule.

Gill took time to consider his judgment, ecided in favour of the District Surveyor, ade an order for the payment of 15s., s. costs.

◆

T IN WAR MEMORIALS.

Civic Arts Association was inaugurated Mansion House on Friday last week, he Lord Mayor as President, Mr. George n, R.A., Professor W. R. Lethaby, , Sir Cecil Harcourt Smith, and Mr. d Warren, F.S.A., as Vice-Presidents; Committee, including Mr. John Lavery, , and Mr. Frank Dicksee, R.A.

Lord Mayor, who presided, said that in of the existence of other societies the lt need of this new organisation had onclusively established. The war had he matter one of urgency, for there was bt that at the close of hostilities there be a vast demand for monuments— l, regimental, and personal, and that d must be met in a manner which would credit on the arts and crafts of the m. Therefore the organisers were not ent too soon in making preparations. nemorials were the first concern, but vould also be scope for schemes of town g, in which order and beauty must have d proper recognition.

Beauchamp moved that the Civic Association be formed. He said the tion should encourage local authorities as well as train, local artists. Most of ad opened art and technical institutes, turned out excellent craftsmen; but, nately, when they wanted some work executed they came to London. He ot understand why people who bought s painted hundreds of years ago should d art patrons. He wished to see more given to contemporary art, and ly more encouragement given to crafts- It was important also that the crafts- ould be given due credit for his work. the worthy war memorials which he hoped would be provided under the advice and guidance of the Association were one to Belgium and another to France expressive of our undying gratitude to the peoples of those countries for their share in the war.

Professor Selwyn Image advocated the formation of local consultative bodies to take matters into preliminary consideration and to make use of the large amount of local talent which undoubtedly existed but too often starved.

Professor Lethaby, anticipating adverse criticism, declared that most of the work of the world had been done by busybodies. He pleaded for art in its practical aspects. After all, great pictures painted themselves, but streets did not light themselves and railway stations did not tidy themselves up. He urged that every town and village should form a committee of public welfare, and that every city should have a society like the excellent London Society to look after its amenities. The arts that mattered and needed cultivation were the civic arts. They were the arts of civilisation, and the arts of civilisation were civilisation itself.

Mr. George Clausen, R.A., said that several members of the Royal Academy, including the President, were in sympathy with the objects of the Association, and most earnestly hoped that before very long there would be given at the Academy an exhibition of arts and crafts. It was generally recognised that the impulse to revive arts and crafts, which was now being felt all over the world, had originated in England; and, though our painting, sculpture, and architecture were looked upon by foreign artists as nothing out of the way, they agreed that what was interesting and typical in English art was to be found in the work of the small band of men who were reviving and continuing the old domestic arts of the country. As a rule our people did not know of the great ability in domestic arts which was to be found in this country, and he welcomed an Association which would bring it to the general notice.

Mr. St. Loe Strachey said there was nothing more difficult to write and yet nothing more necessary than a good inscription on a public monument. He suggested that besides committees to superintend the work of the figurative arts they should have a committee of men of letters to give advice, assistance, and criticism as to what should be said on local monuments.

OBITUARY.

Mr. C. F. Mitchell.

The death, on January 28, at his residence, "Seeburg," Faraday-road, Acton, W., after a short illness, is announced of Mr. Charles Frederick Mitchell, aged fifty-six years, who for the past twenty-five years was headmaster of the Technical Day School of the Polytechnic Institute, Regent-street, W. He was also headmaster of the evening school of the Polytechnic School of Architecture and Surveying and lecturer upon Building Construction at the Polytechnic Institute. He became a member of the Architectural Association in 1891, and was a member of the Society of Architects. Mr. Mitchell was the author, with the assistance of Mr. George A. Mitchell, A.R.I.B.A., head of the Polytechnic Day School of Architecture, Surveying, and the Building Trades, of "Building Construction and Drawing" and of "Building Construction (Advanced and Honours Courses)," Parts I. and II., of which the eighth and seventh editions respectively were published in January of last year; of "Brickwork and Masonry," of which a second edition, revised and much enlarged, appeared twelve months ago; and of "Classic Architecture: A series of Ten Plates Illustrating Typical Examples of the Grecian and Roman Orders," with descriptive letterpress, 1901. The funeral service was held at St. Saviour's Church, Ealing, on Wednesday, February 2.

Mr. W. G. Jones.

The late Mr. William George Jones, of Woking, whose death we announced in our last issue (page 88 *ante*), practised for a while in co-partnership with Mr. A. H. Clinton, of Woking and Farnborough, as architects and surveyors, under the style of Messrs. W. G. Jones & Clinton. The firm was dissolved in June, 1905. Mr. Jones subsequently took into partnership Mr. S. Hunt, under the style of Messrs. Jones & Hunt, of the Broadway, Woking. The partnership was dissolved four years ago. Mr. Jones was the architect of many houses and business premises in Woking and round about.

Mr. W. Whymper.

The death, on January 28, at Esher, is announced of Mr. William Whymper, A.R.I.B.A., aged thirty-two years, elder son of Mr. W. N. Whymper, of Long Ditton, Surrey.

Second-Lieut. T. B. D. Hough.

Second-Lieut. Topham Beecher Dalridge-Hough, of the 8th Yorkshire Regiment, who was killed in France on January 16, aged nineteen years, was the only child of Mr. Topham Hough Hough, of Bridlington. He was educated at Colet Court (St. Paul's School), Hammersmith, and Bridlington Grammar School, where he won several prizes for art. He became a probationer of the Royal Institute of British Architects, and in September, 1914, was gazetted to the East Yorkshire Regiment; he went to France four months ago.

Second-Lieut. A. T. East.

Second-Lieut. Alfred Tomlin East, 3rd Sappers and Miners, I.A., who died in Mesopotamia on December 25 of wounds received at Kut-el-Amara, was the only son of the late Sir Alfred East, R.A., and Lady East. He was educated in Westminster School, and became an Associate member of the Institution of Civil Engineers. He was employed upon the Birmingham Waterworks scheme, the Bombay Municipality Waterworks, and the Assam–Bengal Railway. In August, 1914, he joined the Indian Marines at Bombay, and then the Indian Army Reserve of Officers, being posted to the 17th Company, 3rd Sappers and Miners.

◆

APPRENTICES.

In reference to the letter under the heading of "Apprentices," which appeared in our last issue, it should have been stated that the writer, Mr. T. Costigan, is the Secretary of the Institute of Builders, Koh-i-Noor House, Kingsway, W.C.

THE WHOLESALE TRADERS' ASSOCIATION FOR THE PROTECTION OF THE HARDWARE INDUSTRIES, ETC.

The thirteenth annual meeting of this Association since its incorporation was held at the Registered Offices, 26, Corporation-street, Birmingham, on the 17th ult., when Major J. H. Cartland, J.P. (Messrs. J. Cartland & Sons, Ltd., Birmingham), presided.

The Chairman, in presenting the Report and balance sheet, said he was glad to say that the operations of the Association had again been fully maintained, that the members had made extensive use of its various departments which had afforded them exceptional facilities and assistance in many directions in the present crisis, and that 189 members had joined the Association during the past year, bringing the total membership up to 3,082. It was interesting to note that, notwithstanding the war and the fact that a large number of firms were doing Government work and therefore were not seeking to open new accounts, the number of status inquiries sent in during the year had reached the total of 92,173, thereby showing that there was still a good general trade being done by the various manufacturers and merchants throughout the country, and that a large number of orders had been received from foreign and Colonial markets which they were unable to execute at the present time.

It was reported that a Bill was shortly to be introduced in the House of Lords for the registration of persons and firms carrying on business in Great Britain and Ireland, and this is a measure which the Association had long advocated through different channels for some time past.

THE BUILDING TRADE.

NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS OF GREAT BRITAIN AND IRELAND.

THE annual general meeting of this Federation was held on January 26 at the Holborn Restaurant, London, Mr. A. W. Sinclair (President) in the chair. There was a large attendance of delegates.

The thirty-eighth annual Report submitted showed that the total number of local associations affiliated was 182, with an aggregate membership of about 6,700. The present state of the building trade might fairly be described as quiet, but a revival of building on a big scale might be expected at no distant date, and it behoved them to be ready with both men and material to handle it. The question of providing for an adequate supply of labour again engaged the attention of the Administrative Committee at its November meeting, and the Council again urged the importance of federations, associations, and individual firms giving the question of apprenticeship training their serious attention. The comparative statement of wages and hours of labour was no longer published, but the Secretary kept a card record of such changes as were reported to him, and would be pleased to answer specific questions. The *Builder* also published weekly a reliable record of wages current in over 100 of the principal towns and cities. In regard to the forms of contract and sub-contract there were no fresh developments to record except that negotiations for a form of sub-contract for use with sub-contractors employed directly by the sole contractors had been resumed. The present circumstances had somewhat checked the flow of articles of special interest to the building trade; nevertheless the technical papers were making every effort to elucidate such questions as presented themselves. In this connection attention was called to the following articles which have appeared in the *Builder* during the year:—"Demarcation Disputes and their Settlement"; "Looking Ahead"; "The Reconstruction of Belgian Buildings"; "German Industrial Methods"; "Activities of Builders' Organisations"; "Wages in the Building Trade"; "War Prices and War Wages"; "Labour Statistics"; "Voluntary Services by Builders' Associations in War-Time"; "Coming Needs"; "War Bonus Demands"; "The War Loan, its Effect on the Building Trade"; "Departmental Undertakings as Compared with Public Work Carried Out under the Contract System"; and "Damage to Roads by Heavy Motors." At the end of December the amount subscribed to the Belgian Builders' Relief Fund was £1,948 16s. 8d. Complaint was being made as to the lack of equitable consideration shown to contractors by certain of their clients now that contracts taken prior to the war were finishing or being settled up. When war broke out the position in which contractors were thereby placed was brought to the notice of both the Board of Trade and the Treasury. Although it did not seem practicable to cancel existing contracts because of what had happened, contractors were led to believe that clients in general would give equitable consideration to the question of losses on contracts sustained in consequence of the war by contractors who had faithfully carried out their undertakings. In some cases promises to that effect were given. Judging by the reports and complaints received, these expectations were not being realised. Apparently consideration must be shown by contractors to their workmen in the shape of war bonuses because of the abnormal cost of living due to the war; but no consideration was to be shown by the building owner for the contractor, who was doubly penalised by having to pay war bonuses (for which no return in extra output was received) and by having to pay extra for materials (mainly because of the extraordinary naval and military requirements of the Government), notwithstanding the fact that the building owner got the entire benefits of the contract just as though no war existed. Why should the latter not bear a share of the extra cost of his work due to this extraordinary war? In common fairness he ought unquestionably to do so, and it was only a reasonable expectation on the part of contractors that the Government would see that their case was given the same equitable and effective consideration that had been given to other equitable claims, such as, for example, damage by King's enemies in the shape of destruction of property by bombardment of coast towns. The Report dealt also with the questions of damage to roads by heavy motors, reserved occupations, organisation, and relations with the operatives. In connection with the last item it was mentioned that the continued adhesion of fresh bodies to the conciliation scheme and the formation of a representative scheme for dealing with demarcation disputes was a good augury for the future.

The President, in moving the adoption of the Report, said the Executive had diligently devoted themselves to the practical work of the Federation. The Boards of Conciliation were doing splendid work, and they had now formed another body to deal with demarcation disputes. As they knew, there were certain matters in connection with the national form of contract which they wanted altered, whilst the Royal Institute of British Architects would also like certain details altered. They had met the Practice Committee of the Royal Institute of British Architects, and had found that it might be possible to arrange an agreement satisfactory to all parties. For the moment there was a little complication. In Lancashire the conditions pressed very heavily upon contractors owing to local conditions, and the Lancashire people got out a new contract agreement. As a Federation they wanted to avoid sectional agreements of that kind, and when they received a draft of the document they hoped to be able to join it up in one national agreement for the whole of the country. With regard to sub-contracts, the sub-contractors for years had been asking that they might have greater security in their arrangements for finance, and it was perfectly right that those who did the work should have the best security for receiving payment. The builders also desired to be secured against liability coming on them due to no fault of their own or due perhaps to the default of the sub-contractor. But they found in their interviews with the Royal Institute of British Architects that they were not prepared to recognise sub-contracts. They held that the obligations of architects under the present form of the national contract were great enough, but they did say that if it was possible for builders and sub-contractors to devise a form of contract which would not add to the obligations of architects they would be inclined favourably to consider it. The preparation of such a form was proceeding, and it was hoped before long it would be ready for presentation to the Royal Institute of British Architects. The law with regard to damage to roads by heavy motors was in a very unsatisfactory state, and they had cases where the contractor had had to pay as much as 10 per cent. of the contract sum for such damage. They were endeavouring to secure an alteration of the law so that the builder might know where he was.

Mr. W. Shepherd (London) seconded the motion and touched on the Report of the Employers' Parliamentary Council. That body had practically only held a watching brief with regard to legislation during the year. They would have noticed with interest the difficulties the Government had encountered from labour in consequence of the various activities which had been forced on them by
the war, due to the class legislation pass
recent years. It might be that in the
the Government, having had to face
difficulties, would be more sympathetic
the employers in their troubles.

Mr. Foster (Burnley) urged that the P
mentary Council should prepare a polic
dealing with labour troubles in the futur

Mr. Moffatt asked what was the p
position of contract matters with rega
local authorities and also for some more
with regard to the trade and res
occupations.

The Chairman said that there were
such as those trained in estimating, for
and others who were absolutely indispe
to the builder if he was to continue his bu
but they had failed to get them placed
list of reserved occupations.

The Secretary said the Sub-Com
dealing with local authorities and their
ments were drawing up a draft form, and
hoped to report at the next meeting.

Belgian Builders.

The President thanked the meeting f
response to the appeal for the Belgian
and said the Secretary had been indefat
in trying to find work for the men.

Mr. Thomas (Cardiff) and Mr. S.
(Newcastle-on-Tyne) reported the result o
interview with Mr. Holloway, the Di
of the Building Department of the Minis
Munitions, and Mr. J. Hunter, of the
Construction Department, with referen
finding employment for Belgian bu
The result of the interview was that Mr.
had undertaken a contract for the er
of 100 houses on the Tyne on which emplo
will be given to all Belgian builders who
to accept employment. Mr. Easten
if he found the cost of the Belgian w
was greatly in excess of that of his own
men he would have to finish the house
his own workmen, but he would giv
Belgians every opportunity of workin
he made any profit on the work of the B
he would give half of it to the Belgian
If there was any loss he would bear
pay the men a fair remuneration for the
they did. Mr. Hunter had given hi
introduction to his manager at Tynesid
it was hoped to get employment for
Belgians in steel construction work.

A resolution was passed appealing
trade still further to support the Relief

Pre-War Contracts.

Mr. E. J. Brown (London) move
following resolution:—"That the offic
the Federation be requested to consid
question of pre-war contracts at a very
moment; to collect as much evidence as p
from members of the Federation, and t
steps to place the whole matter befo
Government, with a request that seriou
sideration be given to it with a view to as
contractors to carry out their obliga
He said that if anything was to be don
matter like this, the question must be ta
by a strong, powerful body like the Fed
in a whole-hearted way. He had evid
tweny-five cases of contractors affec
London alone, and it was quite evide
many members of the Federation ha
hit very hard indeed. Some of the
affected contracts which ran into h
of thousands of pounds, and there see
intention of any redress of the grieva
the poor contractors who entered int
contracts, never dreaming there was g
be a war within a short period of sig
contract. The employers who were get
who had got the work done paid
whatever, and apparently had no in
of paying anything towards the increas
to which the contractor had been p
failed to understand why such cases
come under the War Emergency A
practically speaking, the Governme

ımandeered the labour and the goods. ces were advanced all round, and some of works under the sub-contracts were costing n 50 to 60 per cent. more than before the , and yet there was no legislation which e the contractor the opportunity of re- ping himself. At Newcastle in May, 1915, Prime Minister said the taxpayer must ıpensate firms who, through no fault of r own, had to suffer for the general good. presumed that Mr. Asquith would adhere that statement, and it meant that if an ployer of labour lost through the war through fault of his own he would be recouped by taxpayer. On November 25 Mr. Touche ıght a case in the City of London before Chancellor of the Exchequer. It was a tract for £200,000, and the ground landlord ised to postpone till after the war and sted on the contractors fulfilling their agements and paying a ground rent of nething like £5,000 and erecting new ldings. Mr. Touche inquired whether the vernment would introduce legislation to eve the contractor in such a case, but Mr. Kenna replied that it did not come within department. In December the question asked of the Prime Minister, who said that case was under the consideration of the vernment, but he was not in a position to an answer as to whether legislation would introduced. He said he would receive resentations, but the feeling of the London ociation was that it was no use going on h that one case. They therefore asked nbers to supply them with particulars of er cases, and already they had twenty-five. y then thought that it was better to bring whole matter to the Federation, as there st be many other contractors who had been quite as hard. The Government were ady paying war bonuses to meet extra costs buildings put up during the year, which wed at once that they recognised the ease of cost, and obviously those who were ting up buildings under pre-war contracts e making considerable losses. He was l aware that there had been frightful waste the case of Government building. They members in London who had been erecting ses for the workers where six men were ng one man's work and only about half ng that. There were at least four or five es as many men on the work as there was k for, and from ten to a dozen sub-foremen en two would have been sufficient. Those ıgs clearly indicated that there had been ic legislation on the part of the Government get their work done, but there had been a t flagrant refusal to put work out in the nary channels to a contractor under tender, pite the fact that there were thousands of tractors in the country who would have n pleased to have done the work at a *bonâ-* rate and at a proper profit. Under those umstances they surely had a right to ask some redress to contractors who had to y out contracts entered into before the .

r. N. R. Stirling (Liverpool) said that in North-Western Federation they discussed matter twelve months ago, and sent a lution to the Administrative Council asking he Government could not be pressed to g in legislation to relieve pre-war con- tors. The reply was that they did not see what way anything could be done. He many instances which he could give similar hat mentioned by Mr. Brown.

r. F. L. Dove (London) seconded the ion. He was, he said, sanguine enough believe that if the matter was handled tly they would get some redress. He posed that 90 per cent. of the builders he country were affected by pre-war con- ts. He knew that in certain contracts n for the Government the Government certainly gone some way to help the ractor. The people, however, whom they chiefly up against were the county ncils and local authorities and boards of dians, most of whom had assumed a *possumus* attitude. The Government were ing an enormous amount of pressure on e bodies to shut down their works. At instigation of the Government entirely the don County Council were stopping the erection of a large asylum, the contract for which ran into several hundreds of thousands of pounds. They had come to terms with the contractor, and had arranged to release £10,000 of the £20,000 retention-money; to pay the cost of all work done up to date; to give him £8,000 compensation at once and another £8,000 when he started again on the work. He believed that if the matter was properly laid before the Government they would do something.

The President remarked that the Council had a great deal of information regarding fifty or more cases. It was not, however, a subject which could be dealt with in detail by such a large meeting.

Mr. W. Shepherd (London) said he thought that the best way to approach the Government would be by a carefully-worded memorial to the Prime Minister.

Mr. S. Easten (Newcastle-on-Tyne) said he would like to know if it was intended to ask for relief for contractors who had been engaged on public work or to include compensation for those engaged on private contracts.

The President said he took it the position was that where a builder had suffered from the conditions arising out of the war through no fault of his own some recompense should be made.

Mr. Foster (Burnley) said he would like to know why it had been necessary to wait for that meeting. The reason the operatives got all they wanted was because they had an organisation which existed to watch over their interests.

Mr. Waring (Neath) said the South Wales Federation had sent up a strong resolution on the matter. Speaking as one who had been very hardly hit by pre-war contracts, he hoped the National Federation would show the various centres that it was a real live body and that it would make a great effort to obtain some redress for the losses incurred.

Mr. Chessum (London) pointed out that the resolution did not cover the case of contractors who had met their obligations under pre-war contracts. They wanted to recoup those people.

Mr. F. Higgs (London) suggested that Mr. Brown should alter his resolution to read, "so that contractors may be recouped for losses incurred through war causes on contracts entered into prior to the declaration of war."

Mr. Brown expressed his willingness to accept this alteration.

Mr. Taylor remarked that owing to the action of the Local Government Board local authorities were stopping the execution of contracts, and in his town the architect was making what he considered most unfair terms.

The President said that such cases would come in as being due to war conditions.

Mr. Moffat (Birmingham) said that the matter went back to the August of 1915, when they were called together to consider the question of moratorium. They took counsel's opinion, and it was to the effect that the war did not break contracts, and the advice given to contractors was to make the best terms they could with their particular employers. That advice was followed, and increases were granted in many cases. Mr. Wright, of Nottingham, had asked him to mention one point. Many building contractors had running contracts for materials. Mr. Wright had one which carried him into this year, but the supplying firm, which was a combine, cut off his supplies at the end of 1915 and he could get no more goods except at greatly enhanced prices.

Mr. Davidson (Leeds) said the Local Government Board had sent a circular to the local authorities, telling them that where there was a suspension of works one of the points to be considered was the treatment of contractors. He knew of two cases of pre-war contracts where the local authorities absolutely refused to give any consideration whatever to the contractors. Since the war started their members had been warned to put a clause in their contracts providing that any increase in cost of labour and materials consequent on the war should be allowed. He knew of four contracts entered into since the war with a local authority. In two cases the contractors inserted this clause, and in the other two cases they did not, and in those latter cases the local authority absolutely declined to give a single penny.

Mr. S. Easten said he thought the terms of the resolution were too wide. If they asked the Government to take into consideration the extra cost falling on contractors for Government work that was something definite and they might consider it favourably. If they asked them to go a little further and give instructions through the Local Government Board that the local authorities should reasonably consider the suggestion, then they might get them to do it; but he could scarcely imagine the Government entertaining the idea of giving compensation to builders who had lost money by building on private works. He thought it would be well to limit their demands, and therefore proposed the following amendment to the resolution:—"That the officers of the Federation be requested to consider the question of pre-war contracts at a very early moment; to collect as much evidence as possible from members of the Federation, and to take steps to place the whole matter before the Government with a request that serious consideration be given to it, so that contractors may be recouped for losses incurred through war causes upon contracts entered into with the Government and with public authorities prior to the declaration of war."

Mr. J. W. White (Sunderland), in seconding the amendment, said he thought that perhaps the Government might put them in the position of being able to suspend work on private contracts. Where the private owner would not in some way meet the extra cost it was only fair that the builder should be allowed to suspend work until after the war.

Mr. J. Croad (Gosport) remarked that in his opinion they ought first of all to approach the Treasury on the matter.

Mr. Shepherd contended that if the relief was right in one case it was right in another. The relief would have to come out of the pockets of the taxpayer, and it was illogical to say that those doing public work should be relieved whilst those doing private work who suffered from the same causes should not be relieved.

Mr. Renshaw (London), as a "whole hogger," supported the motion, and said he thought it would be possible to set up a court to which all the cases could be referred.

The amendment was carried on a vote by forty-seven to thirty-one.

Mr. Brown said he was astonished to find that contractors had so little sympathy with their fellows that they would assist those having public contracts to recoup themselves, but would refuse to assist a man on the other side of the street who had suffered loss by a private contract. He thought they met as a National Federation to help one another.

Mr. Easten remarked that he thought Mr. Brown should give credit for unselfishness to those who differed from him. Personally, he was not interested to the extent of a single penny in public contracts, but he was affected by the conditions in a private contract for £64,000. His feeling was that if the Government recognised their responsibilities it would put him in a strong position to approach his private owner. If they had carried the resolution he did not believe it would have had a moment's consideration.

On the President proceeding to put the amendment as the substantive motion, Mr. J. Bowen (Birmingham) proposed the following amendment:—"That the officers of the Federation be requested to consider the question of pre-war contracts at a very early moment; to collect as much evidence as possible from members of the Federation, and to take steps to place the whole matter before the Government, and that the question of the scope of the representations to be made shall be left to the discretion of the Committee."

Mr. W. F. Wallis (Maidstone) seconded.

The President remarked that it might happen that further information might come in and the Committee might think well to work on certain lines.

Mr. Easten said the Committee would know the feeling of the meeting, and therefore he would not oppose the amendment.

Mr. Bowen's amendment was then carried as the substantive motion, and a resolution was carried authorising the Council to co-opt four members from the general body of members to assist the officers in the matter.

Boards of Conciliation.

The meeting decided to accede to the following applications for affiliation to the National Scheme of Conciliation:—Navvies, Builders' Labourers and General Labourers' Union, Amalgamated Slaters' and Tilers' Provident Society, National Union of Gas Workers and General Labourers of Great Britain and Ireland, United Order of General Labourers of London, National Union of Operative Heating and Domestic Engineers.

An application by the National Federation of Slate Merchants, Slaters, and Tilers was referred to the Administrative Committee for further consideration, the President explaining that they were not an operatives' society.

Mr. Renshaw called attention to several instances in which the experience of the London Association in regard to the Board of Conciliation had not been satisfactory, and said they ought not to permit the Boards to be used for making operatives pay their arrears of subscriptions to their unions.

Mr. Davidson (Leeds) asked what the position was with regard to the resolution passed at the Leeds meeting giving associations the option of relaxing the rules of the Board. In Yorkshire they had had instances of men going on strike and the leaders had not ordered them back.

Mr. Storrs said the position was perfectly clear. It was found in certain areas that men were being attracted to munitions work in consequence of the high rate of pay, and the employers were prepared to increase their wages at once instead of waiting for the notice according to the rules, and to meet these cases an option was given to local associations to relax the rules. His own experience had been that where the option had not been exercised the men's leaders had obliged them to abide by the rules. He believed that after experience London would find the Conciliation Boards as beneficial as they had in the North.

On the motion of Mr. Hope, a vote of thanks was passed to Mr. Storrs for his work in connection with conciliation.

Wallpaper Discounts.

On the recommendation of the Executive Council it was decided that Messrs. Foster, McHugh, and Renshaw, and a member of the Lancashire Federation to be selected, be the representatives of the National Federation for a further conference with the merchants and manufacturers on the question raised by the reduction of the well-established trade terms allowed hitherto in respect of wallpapers.

Apprenticeship.

The President explained that a Sub-Committee was considering the apprenticeship scheme of the Institute of Builders and also a scheme of their own, and hoped to bring up something helpful to the trade.

Mr. Renshaw said there had been some correspondence in the *Builder* on the matter, and the Institute of Builders had drawn up a full statement of their ideas on apprenticeship which they were asking the Press to publish.* He believed their ideas could be carried out in many of the large towns, and he asked for a careful consideration of the scheme.

Mr. Cooke (Preston) and Mr. Lloyd (Neath) also urged the importance of the matter.

Commerce of the Empire.

Mr. S. Smethurst (Oldham) submitted a resolution, proposed in his absence by the President, viz.:—"That it be an instruction to the Administrative Committee to consider proposals from associations which have for their object the combining of the federations and trade organisations of this country and the Empire, with a view to protecting, consolidating, and extending the trade of the Empire, and particularly with a view of advising the respective Governments on all matters affecting trading relations and the welfare of the people; and if satisfied with the proposals of any to give their tentative support pending a report to the Council in July next, and that the President and Secretary collect all necessary information for the Administrative Committee."

Mr. Foster seconded the motion, which was supported by Mr. F. C. Rice (London), who suggested the advisability of working with the Associated Chambers of Commerce in the matter.

The resolution was carried.

Elections.

The President proposed the election of Mr. W. F. Wallis as the President for the ensuing year. He referred to Mr. Wallis's long connection with the Federation, and said he was an ex-President of the Institute of Builders and of the London Association of Master Builders. They could look to him to maintain the best traditions of the office.

Mr. E. J. Brown seconded the motion, which was carried.

Mr. Wallis said he first became connected with the Federation in 1891, and they knew how it had progressed since that time.

A hearty vote of thanks was passed to Mr. Sinclair, and he was elected a Vice-President.

Mr. Sinclair acknowledged the vote, and moved a vote of thanks to Mr. A. G. White, the Secretary, and Mr. Wall, his assistant. He said that Mr. White not only put life and energy into the work, but soul also.

Mr. Wallis seconded the motion, which was carried.

Mr. Storrs was elected Senior Vice-President; Mr. Willcock, Junior Vice-President; Mr. S. Easten, Treasurer; Mr. Dove, Senior Hon. Auditor; and Mr. Forsdike, Junior Hon. Auditor.

It was decided to hold the July meeting in Brighton.

GENERAL BUILDING NEWS.

CHURCH, KILLEAD.

A suite of school buildings is now in process of erection in connection with the Killead Presbyterian Church. Mr. J. Hunter, B.E., Lisburn, is architect, and Messrs. Kirkpatrick Brothers, Muckamore, the contractors. When completed the school will contain a main hall, classrooms for boys and girls, and accommodation for the purpose of instruction in the various branches of education. The building will be heated by low-pressure radiators, supplied by Messrs. Musgrave & Co., while the windows will be installed in steel casements provided by Messrs. Williams, of Chester. The main hall will accommodate 400 people, and the school will afford accommodation for 150 pupils.

TRADE NEWS.

The City Surveyor of Sheffield has used Pudloed cement for waterproofing underground lavatory with satisfactory results, and the engineer for the new Ameer's Palace now being built in Afghanistan has used "Pudlo" for waterproofing the cement work.

Boyle's latest patent "air-pump" ventilators have been adopted for St. Paul's Church, Swanley Village, Kent.

The Red Cross Hospital for Wounded Soldiers, Hale End, Essex, is being supplied with Shorland's double-fronted patent Manchester stoves, with descending smoke flues and patent exhaust roof ventilators, by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

◆

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to THE BUILDER LTD., and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

◆

Construction of New Sewers in St. John's-road and Bunn's-lane.

Lewis & Taplin, Birmingham	£460

ISLEWORTH.—For alterations and repairs at the Union Offices, and (2) at Warkworth House, for the Guardians of Brentford Union :—

Alterations to Old Warkworth House.

Leighfield, Jersey-road, Osterley	£70 15 6

[Consideration of tender for alteration to Clerk's Office adjourned.]

LANARK.—Accepted by the City Council for the erection of the remaining 150 houses at Mossend to accommodate munition workers :—

Digger, Brick, and Mason Work: J. J. & P. M'Lachlan, Larbert	£13,589	6	3
Carpenter and Joiner Work: J. M'Donald, Glasgow	16,016	11	10
Slater Work: P. White & Co., Glasgow	4,058	6	4
Plumber Work: G. Munro, Glasgow	7,312	12	10
Plaster Work: H. S. Bathgate, Glasgow	1,607	18	7
Painter Work: P. S. Murray, Hamilton	741	6	7½

LANCASTER.—For making alterations at the Confectionery Department at the Central Buildings, New-street, Lancaster, for the Lancaster and District Co-operative Society, Ltd. Mr. R. Jackson, architect and surveyor, 32, Market-street, Lancaster. Quantities by architect :—

Mason: R. Ward, Lancaster*	£25	11	0
Joiners: Peill & Ridley*	124	15	0
Plumbers: Calvert & Heald*	82	9	6
Painters: R. Crook*	24	9	0

MAIDSTONE.—For the reconstruction of t sewers and drains at Nos. 1 to 7, Warwick-ro and Nos. 11 to 18, Stacey's-passage, for the Tow Council :—

Cruttenden & Son	£56	0
R. C. Barney & Son	54	15
G. Pearce & Son	54	5
Martin & Newman*	52	8

NEWPORT (Mon).—For the construction of new road, from Corporation-road to Spitty-lane, f the Corporation :—

J. H. Monks, Newport*	£919

ROMSEY.—For the pulling down of the o house standing on the Woolpack premises, and f the erection of three cottages on the site, for t Town Council :—

G. J. Drewitt*	£65

THE BUILDER

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

VOL. CX.—No. 3810. FEBRUARY 11, 1916.

NECESSITY AND COMMERCIAL PROSPERITY.

IT was said by Herodotus more than two thousand years ago that the most industrious and wealthy nations were not those living in countries where the conditions of life were easiest and in which Nature had been kind and bountiful, but those countries here Nature or war had imposed on the people difficult nditions, which served as a powerful incentive; and what as true two thousand years ago remains equally true to-day, d one of the handicaps which will remain after the war will that of high taxation. We can obtain nothing from nothing; d if we lived on some barren and unproductive plain, remote om the highways of commerce, high taxation would mean end to possible progress and would lead to stagnation. apoleon told O'Meara at St. Helena that the colossal debt cumulated during the Napoleonic Wars would lead to mmercial bankruptcy here, for the great war with France d cost this country the equivalent of £2,000,000. The evelopment of our manufacturing industries, the invention d use of steam, modern agriculture, commerce, and banking ere more the outcome of necessity than chance, and ritain entered into an era of enormous commercial rosperity which but for war might have come far more owly, if indeed it had come at all.

In a similar way the natural poverty of Germany stimulated s rulers and people to build up commerce and wealth by the nprovement of methods and organisation of industries which wards the end of the last century were rapidly displacing those f this country, in many ways in a more favoured position of dvantage. In the case of America the stimulus was of a ifferent character—the necessity of settling a large area of irgin land, of dealing with a volume of foreign immigration hich the world had never seen before, and, lastly, of meeting e handicap which arose through the high rate of wages in new country. That important factor, which is one which it evident we shall have to deal with here, has been met in merica by a far greater readiness and quickness in adapting nd using the increased powers given by machinery.

Two years ago the Board of Trade published its first Census f Production, relating to the year 1907, which shows that in e boot and shoe trade every thousand wage-earners ere employed 178 horse-powers as against 486 in the United tates; in the butter and cheese industries, 1,447 horse-powers s compared with 5,507 horse-powers; and in cement-making, 195 horse-powers as against 13,873. Thus each worker who employed in many industries in the United States produces om three to four times as much as his competitor in this untry. These figures prove that with wages of twice the mount paid in this country commodities could be produced ore cheaply in the United States than in this country, though rough the operation of tariffs the manufacturer may in many ases be able to sustain prices, so increasing his profit. In he boot and shoe trade the large importation of American oots and shoes was checked by the introduction of improved achinery and methods of manufacture, but authorities are robably right in saying that British industrial output can be oubled or trebled by the introduction of labour-saving achinery; but hitherto capitalists and workers have been ontent with a comparatively low standard of production, hile the workers in addition have, in many cases, opposed he introduction of better machinery from the same unreasoning islike which frequently led to the attempts to obstruct the ork of the first railway builders.

Clearly, therefore, there is no reason to assume that we ave not in our hands a means by which we may make ood the wastage of war and once again enter into a period of great commercial prosperity and expansion which but for the stimulus of necessity would have remained untouched and untried.

In a large number of cases we have the new means already provided in the shape of factories and power plant newly built for purposes connected with the war, and by the enlargement and refitting of existing factories for war purposes. It is also to be hoped that labour will recognise that it has nothing to gain by the limitation of output. Fiscal changes, though they may take the form of the creation of tariffs in this country, will be accompanied with the lowering of others we have had to contend against before the war, so that the net result may well be to give this country a nearer approach to free trade than was possible so long as the freedom of English markets was assured to all nations, whatever tariff walls they erected against the introduction of our goods. If America, enjoying the effects of peace while Europe has to expend its millions on war, should prove too dangerous a rival in European markets, it is quite possible that the Allied countries may safeguard their common interests by placing her manufactured products on less favoured terms than those of the countries which have been banded together against a common enemy.

Mr. John E. Gardin, Vice-President of the National City Bank of New York, says that, while it is true that the English banknote cannot now be redeemed, all know that its redemption is absolutely assured and that New York had lost its chance of taking England's place in supremacy as a financial centre because it was too busy trying to pay its own debts to assume any of the burdens of the other countries; but that England is now paying the penalty of its commercial greatness, because the whole world is using whatever credits it has to dispose of in London to create Dollar Exchange in the only country in which commodities can be readily purchased; however, the present state of things will be altered with the advent of peace, and if American competition in European markets is too strenuous after the war the Allied nations, acting together, will have it in their power to redress the balance by united action such as would have been impossible but for the war.

It may thus be that American capital, seeking to secure its share of European commerce, may possibly be driven to invest it in the shape of works and the employment of labour in Europe—in financing European industry rather than in competing with it.

Mr. Gardin says: "The reconstruction of normal conditions will be slow. The flower of European manhood has been swept out of existence. What is left, being more or less incapacitated, will not be able to do its share in the world's work, hence a great deal will be expected of our people who have been spared the hardships of war." Mr. Gardin appears to neglect somewhat the lessons of past history, which go to prove that, in spite of the wastage and loss of war, its effect has often been marked by the subsequent commercial quickening of production and enterprise. The Civil War in America was the starting-point of the industrial development of some of the richest mineral districts in America, which might have remained for long untouched had the old *régime* lasted; the milliards of francs paid by France to Germany after the last war, the loss of life, and the cession of rich provinces left a nation more determined to develop its resources than ever before, and so added to the wealth of France; and it may be that the countries which are outside the present war area will be precisely those which will not feel the advantage of the great activities which make national wealth—activities which are born amidst the storm and stress of stern necessity.

NOTES.

The R.I.B.A. Gold Medal.

We are glad that the R.I.B.A. Gold Medal is to be awarded to Dr. Rowand Anderson, who has long been prominent among the ranks of distinguished architects for the merit of his executed work, his services to the cause of architectural education, and his high character and lofty ideals. Dr. Rowand Anderson has been one of those whose work and life have done honour to a great art, while his example has set a standard which all must be grateful for.

Drawings by William Burges.

A collection of the designs and working drawings of the late William Burges has lately come into the possession of the Royal Institute of British Architects, and a selection from them, now on view in the Common Room, consists of the working drawings of his own house in Melbury-road. When the final estimate of the work of the protagonist of the movement known as the Gothic Revival comes to be made it is possible that, after Pugin, Burges will take an outstanding place as the one man who saw beneath the surface of things—whose work had value as architecture apart from the style in which it was presented. Be this as it may, there is no doubt these drawings have a freshness of interest not usually found in work of this period, which seems to suggest that the endeavour of the artist was not chiefly confined to the archæological reproduction of the details of the style in which he happened to work. Perhaps this freshness of interest is due to the fact that Burges appears to have drawn so much of his inspiration direct from Nature, and also to have aimed at a directness and simplicity of arrangement and expression which alone lifts his work above the level of most of his contemporaries and followers. Although these designs are in a style no longer fashionable, they can hardly be called old-fashioned, and every artist will find pleasure in studying them. The Institute is to be congratulated on their acquisition.

The Museums.

The decision of the authorities as to closing the British and other museums has aroused a volume of protest in the daily Press which appears to be largely justified. Economy may be of two kinds—the direct economy of the Government in restricting its spending capacity, and the indirect measures such as taxing amusements in order both to obtain revenue and to enforce individual economy by making amusements more expensive. It may be assumed that few can do without some form of recreation or amusement, and if the sources where such recreation and pleasure can be obtained inexpensively are cut off there will remain a greater inducement to indulge in what is more costly. It also seems to us that if a proper appeal were made by those in authority many would be willing to give up time and act in the capacity of attendants and caretakers in museums and galleries, thus enabling the Government to promote economy without closing them. Presumably the routine duties of a museum attendant or caretaker are no more difficult or onerous than those which fall to the lot of a special constable, and the method of dealing with the two problems is almost identically similar.

War Memorials: A Suggestion.

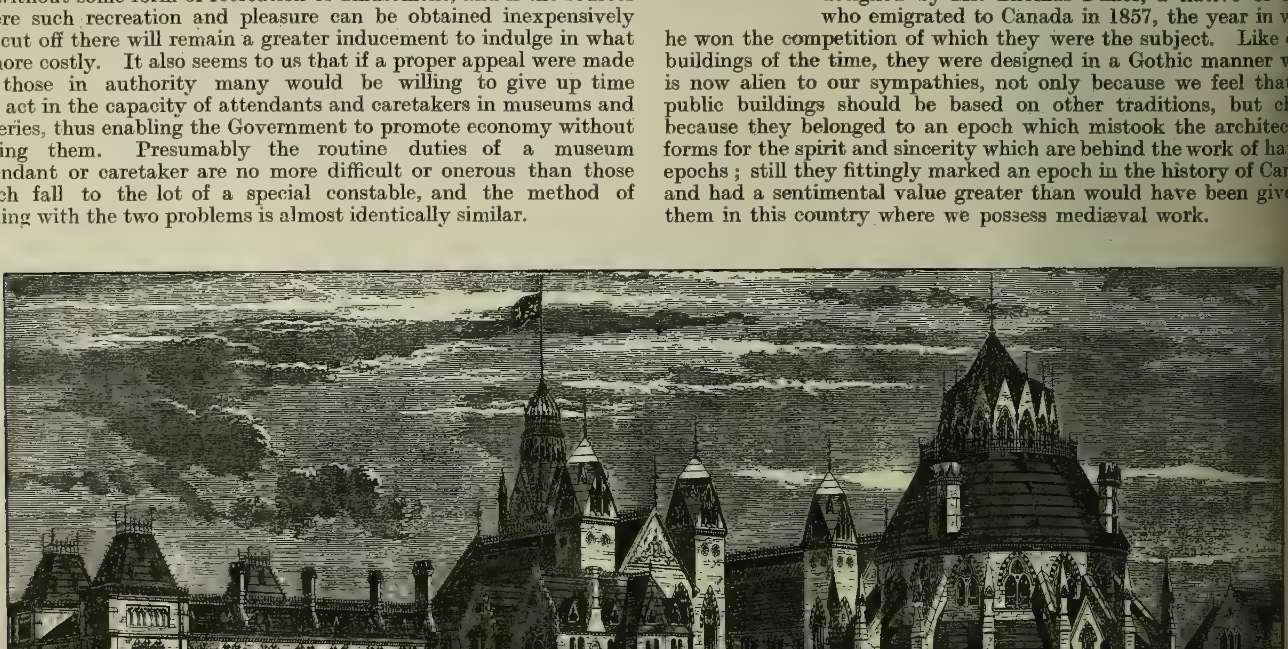
Canon H. D. Rawnsley, in a letter to the *Times* pleads for two kinds of possible war memorial in the form of (1) the endowing of our secondary schools with scholarships, which will enable th best scholars to pass on to the Universities, which would be otherwise impossible for financial reasons; and (2) th acquisition of some beautiful view point, open space, or space o historic influence to be dedicated to the public in memory of the brav men of the locality who have fallen in the present struggle. Canon Rawnsley states that an offer has reached him, and will be laid befor the National Trust at their next meeting, of twenty-six acres o moorland near one of the great Lancashire towns to be preserve in memory of a lover of Nature who has fallen in war. We think both suggestions are admirable, and have little doubt that they wil fall on fruitful ground, since no community is so small or poor tha it might not afford so simple and appropriate a memorial to its dead

The Damage from Air Raids.

The recent air raids will again draw attention to th question as to whether the victims should no receive compensation from the public funds, an whether the system of insurance inaugurated by th Government is equitable. In this connection th observations of Lord Justice Phillimore in delivering judgment o Saturday in a case in which a Welsh coal company were seeking t recover from the County Council police expenses incurred during th strike riots in 1910 seem particularly apposite. His lordship i reported as saying: "The subject pays rates and taxes to ensur himself protection against domestic as well as foreign foes, and it i the duty of the Government to provide him with it. The result o this matter is that, unless Parliament takes steps to recoup thos who have had to bear burdens which should never have been imposed upon them, the colliery companies as to part, and apparently th ratepayers of the Metropolis as to the rest, have to defray expenses which should properly be borne by the Exchequer." These words seem peculiarly applicable to the damage incurred in air raids. Th system of insurance is an addition to the taxes already paid to obtain security, and, as such, is unjustifiable; it is also inequitable in its application, as it is a tax on those who may sustain no damage; and, lastly, the scheme has been imperfectly formulated, since there i considerable doubt whether, should any dispute arise under a policy, the aggrieved subject can bring an action against the Government.

The Parliament Houses at Ottawa.

We regret to record the loss, by fire, of the Parliament Houses at Ottawa, since they appealed to th affection and imagination of Canadians. They were designed by Mr. Thomas Fuller, a native of Bath, who emigrated to Canada in 1857, the year in which he won the competition of which they were the subject. Like othe buildings of the time, they were designed in a Gothic manner which is now alien to our sympathies, not only because we feel that ou public buildings should be based on other traditions, but chiefly because they belonged to an epoch which mistook the architectura forms for the spirit and sincerity which are behind the work of happie epochs; still they fittingly marked an epoch in the history of Canada. and had a sentimental value greater than would have been given t them in this country where we possess mediæval work.



Parliament Buildings, Ottawa, Canada West.

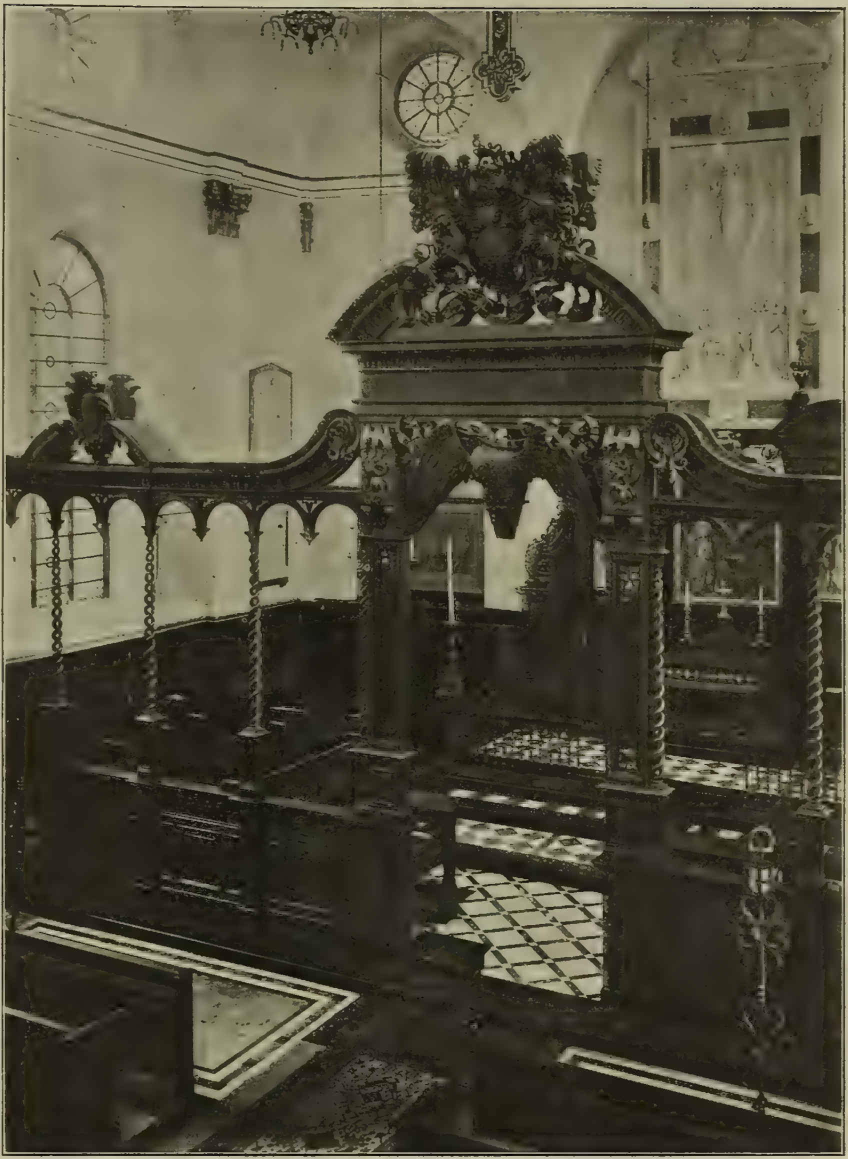
Messrs. Fuller & Jones, Architects.

IE LONDON CHURCHES)F WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

No. X.—St. Margaret, Lothbury.

r. MARGARET, Lothbury, is situated imme-ely opposite to the Bank of England in ıbury. With the church, which is in the of the Crown, are united the parishes of other churches, which either were not ilt after the Fire or have been demolished equently, namely, St. Christopher-le-ks, the first church of Wren's to be olished, which was removed to provide e for the extension of the Bank of England 781; the Church of St. Bartholomew, by the hange, pulled down in 1841, which faced the hange on the site now occupied by the Sun Office; St. Olave, Jewry, situated on the side of Old Jewry, and demolished in 1888; Mildred, in the Poultry, pulled down in ; and St. Martin Pomeroy and St. Mary church, which were not rebuilt.

. Margaret, Lothbury, thus serves seven shes, and, though its architectural scheme ceedingly simple, it forms one of the most tiful of all Wren's interiors, the woodwork ornament of the church being unusually and well preserved, while the single aisle the street forms a Morning Chapel, a en between the range of columns dividing el and nave without disturbing the unity of ral effect. The magnificent chancel screen the sounding-board of the pulpit were of the woodwork of All Hallows, Thames-t, and were re-erected in St. Margaret's the destruction of All Hallows. The n gallery in the west end of the church fine and simple example of design, and the ble font in the Morning Chapel, an unusually l and delicate specimen of marble work h is attributed to Grinling Gibbons. The ch is well lighted, so that its detail can seen to exceptional advantage, and the ern decorative accessories which have been added, notably a suspended cross over the chancel screen, designed by a son of the present rector, the Rev. A. J. Ingram, M.A., are in keeping and harmony with the general scheme.



The Chancel Screen, St. Margaret, Lothbury.

The Pulpit, St. Margaret, Lothbury.

Externally the treatment is simple and pleasing, the range of windows and the projecting columned porch are good, while the steeple, though not of exceptional interest, is well proportioned and architectural in its character. The present church was completed in 1690.

No. XI.—St. Augustine, Watling-Street.

At the angle of Watling-street and Old Change stands the Church of St. Augustine, with which after the Great Fire was united the parish of St. Faith, which was built under old St. Paul's. Originally the Church of St. Faith had been built above ground, but it was pulled down in 1256, when the Cathedral was extended eastward, and replaced by a church under the body of the Cathedral. During the Great Fire the booksellers of Paternoster-row and St. Paul's-churchyard removed their stock to St. Faith's, hoping it would be preserved by this means, and it is stated that books thus burnt were worth £150,000.

The Church of St. Augustine forms a nave covered by an elliptical ceiling with aisles. The effect of the design is probably much spoiled by the removal of the high-backed pews, which tends to exaggerate the unpleasant proportion of the very high bases of the nave colonnade. Architectural character is also diminished by the glazing introduced in bays of the elliptical ceiling, the general impression given by the interior being wanting in architectural mass and solidity.

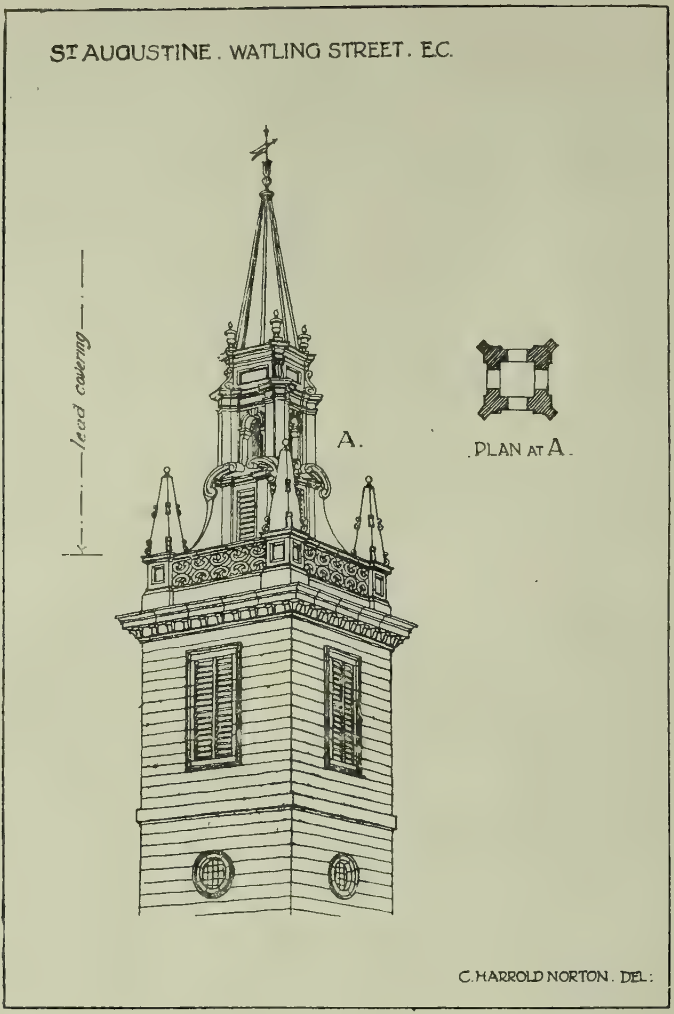
The woodwork has been much cut about and damaged. Originally there were galleries on the north and west sides, but the west gallery, which contained the organ, has been removed.

Externally the design of the tower and steeple is pleasing, its delicacy of outline and proportion forming a good contrast to the mass of the adjacent Cathedral.

No. XII.—St. Anne and St. Agnes, Aldersgate.

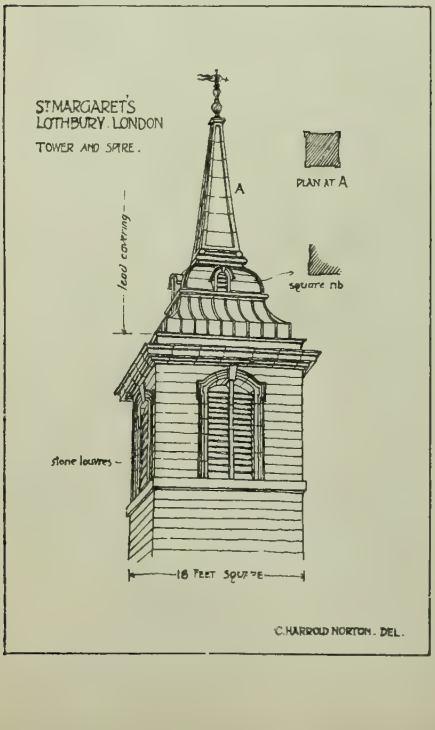
St. Anne and St. Agnes stands on a site towards the west end of Gresham-street, on a free site, which is surrounded by buildings except on part of the side facing Gresham-street. The parish church of St. John Zachary, which was not rebuilt after the Fire, was united with that of St. Anne and St. Agnes.

It is recorded that in 1670, the Commissioners having decided that St. Anne and St. Agnes should form the eleventh church in order of rebuilding, proceedings for putting the decision to effect were inaugurated by a dinner at the Fountain Tavern, to which Sir Christopher Wren and the Commissioners, with the alderman of the ward, Sir Thomas Bludworth, were invited, but it was not till 1677 that the contract was signed, the contractor being John Fitch, carpenter and bricklayer, a member of the Grocers' Company. The amount of his contract was originally £691 16s., but was subsequently increased. Other master craftsmen were John Sherwood, plasterer; Thomas Dobbines, plumber; Stephen Leader, smith; John Haywood, carpenter; William Hammond, joiner. A loan of £500 for rebuilding was granted out of the Chamber



of London to be charged on the coal revenue. Further loans were negotiated in 1680 from Thomas Blackhay, by means of a mortgage on some houses belonging to St. Anne's, for £150 at 5 per cent., and from a Mr. William Whitehall on houses belonging to St. John for a like sum. In 1681–82 a sum of £154 7s. 6d. was received from the Chamber for the parish church ground of St. John's.

The "Pulpitt and Alterpiece" cost £146 17s. 6d., the "ffont" £13, while the "Pews and ornaments of the church" were put up in 1679–80 by means of an assessment of "fower years Tax according to the Poores Poll," which produced £172, while the work actually cost £185.



The Goldsmiths' and Wax Chandlers' Companies demurred against their respective assessments for pew-money, amounting to £45 and £15. In the former case the matter was left to the generosity of the Company, who eventually gave a sum of £30 in 1685–6, but in the case of the Wax Chandlers' Company proceedings were taken in Doctors' Commons, which resulted in the payment of £9 in 1683–4. The total cost of the church amounted to £2,488 0s. 10d. These records form an interesting proof that obtaining money for the erection of a church was at no time an easy process, and would further show that economy in design was forced upon Wren by circumstances.

The church externally is quaint and simple; internally it forms a member of the group of churches planned round a square centre feature of four free standing columns and having two plaster vaults intersecting in the centre. The four angle compartments have flat ceilings with very shallow saucer domes in their soffits. The woodwork is simple in character and sparing in ornament compared with most of Wren's churches, but the church is well lighted and pleasing in its details and treatment. The patronage is in the gift of the Bishop of London.

THE GOLD MEDALLIST OF THE R.I.B.A.

At the last meeting of the Royal Institute of British Architects the President announced that the Council had unanimously nominated Sir R. Rowand Anderson, LL.D., Fellow, as a fit recipient of the Royal Gold Medal for the current year, in recognition of the merit of his executed work, his services to architectural education, and his high character and lofty ideals in the art of architecture.

THE CARPENTERS' HALL LECTURES:

MEMORIALS AND MONUMENTS.

THE first of a course of ten art lectu arranged by the Carpenters' Company, given on Wednesday last week by Mr. Lawre Weaver, F.S.A., in the Hall of the Compa London-wall, Mr. W. W. Pullein, Mas presiding.

The lecturer, whose subject was "Memor and Monuments," in the course of his rema said:—

"The spirit of the subject which I am putt before you this evening, that of "Memor and Monuments," is best seen, I think, in th words from the book Ecclesiasticus, wh many schools and colleges sing as an anth on their Commemoration Day, when t remember their pious founders and benefacto "Let us now praise famous men and fathers that begat us. The Lord hath wrou great glory through them by His great po from the beginning. There be of them t have left a name behind them, that their pra might be reported, and some there be which h no memorial, who have perished as tho they had never been."

And then the writer of Ecclesiasticus retu to those who have been honoured in rem brance, and he goes on: "Their name s remain for ever, and their glory shall not blotted out. Their bodies are buried in pe but their name liveth for evermore. people will tell of their wisdom, and the con gation shall shew forth their praise."

The art of memorial design has preci this intent, worthily to show forth the pr of those who have given up their lives for safety and honour. We shall indeed h failed in our honourable duty if posterity say, "Some there be of our gallant sold and sailors which have no memorial." author of the first book on monumen a man oddly enough of my own name—wri as long ago as 1631, gave this simple but enti adequate definition: "A monument is a t erected, made, or written for a memoria some remarkable action yet to be transfe to future posterities."

When the war is over we shall have m pressing duties of national and social an military and economic reconstruction, there will be one duty, or rather privilege, w must not be overlooked—the setting up fitting monuments. Nor is it likely to be o looked, for our hearts will be filled wit passionate gratitude, but we must see t that this gratitude takes shapes worthy the occasion, worthy of the country, worthy of British art. In this connec I would remind you of the meeting held

Wren's Churches. (*See page* 119.)

iday at the Mansion House, under the
sidency of London's chief magistrate, the
rd Mayor, at which the Civic Arts Association
s formally established. It has many pur-
ses. The wide scope of its title indicates
it it is concerned to raise the level of civic
at large, but its more immediate and
ictical purpose is to educate public taste in
matter of war memorials, whether they are
iple tablets to humble individuals or noble
numents to great regiments and to large
oups of men, such as the old boys of a public
100l. Still greater than these will be the
at national monuments to the men of the
perial races. No doubt there will be set up,
bably in London, a noble memorial to the
glishmen who have given their lives for
rrie England. Probably also Scotsmen,
shmen, Welshmen, Canadians, South
ricans, Australians, New Zealanders, and
lians will commemorate in imperishable
rble and bronze the amazing gallantry of
ir brothers. I am, however, going to devote
time rather to the smaller memorials
propriate to individuals.

Professor Adshead is just now delivering at
iversity College a series of lectures on War
morials, and is dealing mainly with the
iception and form of the greater monuments
ich have to be considered in relation to the
ially great opportunities of town planning
a large scale. Such extensive schemes
l be in the hands, we hope, of our ablest
hitects and sculptors, who may be presumed
be in no need of advice from me. Although
h monuments will be of national importance,
l will indeed serve notably to test how far
architects and sculptors have grasped the
sons of the Grand Manner, they will neces-
ily be few in number. On the other hand,
smaller memorials to individuals and to
le groups will number thousands, and there
great danger that without careful considera-
n of the subject of memorial design the
omoters of such monuments will fail to
lise the importance of securing able artists
carry out even the smallest works. It is
this reason that I published my recent
ok, "Memorials and Monuments," and it is
this reason that when asked by the
rpenters' Company to lecture here I chose
s subject, which seems to me the most
portant at the present moment from the
nt of view of British art. We have only
recall to our minds the character of the
morials put up after the South African
ir to realise how little attention the subject
n received, how lamentable in general was
failure to rise to the opportunity, and
v necessary it is that the memorials of the
at war shall be in every way worthy.

A thoughtless and inartistic monument
rely adds a new terror to death. Many
ngs serve a memorial purpose—a reredos,
brary, a parish pump, but the best monument
all is the useless one, because it represents
most obvious sacrifice."

The lecturer then proceeded to show some
ty slides of monuments, ancient and modern,
l to comment on their significance.

◆

ARCHITECTURAL SOCIETIES.

Edinburgh Architectural Association.

he Edinburgh Architectural Association
on the 3rd inst. in the lecture hall of the
lege of Art, when a lecture was delivered by
W. T. Oldrieve, F.R.I.B.A., on "A Recent
it to New Zealand and the South Sea
nds." Mr. T. F. Maclennan, A.R.I.B.A.,
sident, occupied the chair. The subjects
lt with by the lecturer and the views shown
ted principally to the architecture typical
the places visited. The architecture of the
oris was illustrated by slides from photo-
phs of their dwellings and guest-houses,
a series of wood carvings showing both
ient and modern workmanship. A fine
cimen of the application of an ornamented
canoe to Maori house architecture was
wn in a view of a "pataka," or food-house,
ch was built out of a large war canoe on
shore of Papaitonga Lake. A plan of a
ical Maori "whare," or dwelling-house, with
ails of its construction, was explained, as also a plan of a fortified Maori stronghold, or "pa." The construction of the typical colonial wood-framed bungalow was illustrated at various stages of construction as seen by the lecturer, and some attractive finished specimens were shown. The granites and building stones of New Zealand and the extraordinary variety of New Zealand timber trees were also referred to. The views of houses in Fiji, Tonga, and Samoa embraced both native and modern types, a remarkable difference being apparent between the native type of "palace" in which Tamassese, High Chief of Samoa, was interviewed, and the modern-looking wood-built palace of King George II. of Tonga. The lecture was concluded by showing a selection of views of public buildings in Monte Video.

OBITUARY.

Mr. T. M. Houghton.

The death on January 31, at his residence, "Westbrook," Clapham-road, S.W., is announced of Mr. T. Marcus Houghton, M.S.A., F.S.I. He was the architect of the headquarters for Naval Cadets, Wandsworth, and of the block of buildings for shops, offices, and chambers at the corner of Charing Cross-road and High-street, St. Giles-in-the-Fields.

Second-Lieut. W. E. Davies.

Second-Lieut. William Edward Davies, 5th Cheshire Regiment (T.F.), who died of wounds in France on January 29, aged twenty-five years, was the third son of Mr. Percy Davies, of Curzon Park, Chester. He was educated at Arnold House, Chester, and Liverpool University, where he was a student of the R.I.B.A., and won the first-class certificate of the Liverpool School of Architecture and the Lever Scholarship. He then entered the offices of Mr. P. H. Lockwood, of Chester, architect, and continued his studies in London, when, at the outbreak of the war, he joined the Artists' Rifles. He went to the front in September, 1914.

◆

MEMORIAL TABLET, WESTMINSTER ABBEY.

A tablet by Sir George Frampton has been placed in the south aisle of Westminster Abbey in memory of the late Canon Barnett.

GENERAL NEWS.

A British Trade Fair.

From February 21 to March 3 a British Industries Fair is to be held by the Board of Trade in the ground floor courts of the Victoria and Albert Museum. The fair is a successor to that given in the Royal Agricultural Hall in May, 1915.

The Royal Cambrian Academy of Art.

We understand that Mr. Ivor M. Pritchard, A.R.I.B.A., second son of Councillor O. J. Pritchard (Beaumaris), has been elected an associate of the Royal Cambrian Academy of Art. He is an inspector of the Royal Commission on Welsh Historic Constructions.

Builders' Clerks' Benevolent Institution.

The forty-ninth annual general meeting of donors and subscribers will be held at the offices, Koh-i-Noor House, Kingsway, W.C., on Tuesday, February 29, at 7.30 p.m., Mr. F. Higgs, President, in the chair, to receive the report and balance sheet for the past, and to elect officers for the present year.

Building Trade, Blackpool.

The building trade at Blackpool has been much affected by the war. At present 128 dwelling-houses are in course of construction. The year 1914 constituted a record in the local building trade, 568 plans of houses being approved. During the five years ending 1914 the number of houses erected in the borough was 2,406.

Closing of Museums.

A deputation representing the Museums Association has been received by the Prime Minister. The Association made representations concerning the closing of national museums and art galleries, endeavoured to demonstrate the great and increasing part they have been playing in the life of the nation, and suggested the possibility of rendering them still more valuable as institutions in war-time.

Ancient Church Partially Destroyed.

The parish church at Poulshot, near Devizes, has been partially destroyed by fire. The cause is supposed to have been an overheated stove pipe. The Devizes fire brigade did good service in saving part of the building, but the nave and aisles were destroyed. The church is of historical interest. The fabric dated from the twelfth century, but considerable alterations were carried out in the sixteenth century.

Rebuilding of Louvain.

Much satisfaction has been caused in Belgian circles in Holland (says a Central News telegram from Amsterdam) by the German statement that the Germans do not intend, as was at one time reported, to undertake the rebuilding of Louvain. The *Echo Belge* remarks that it is bad enough that the Germans should have destroyed Louvain, but for them to rebuild it in the German style would be even worse.

Leeds School of Art:
Department of Architecture.

As a result of a recent conference between the Board of Architectural Education of the Royal Institute of British Architects and representatives of the Leeds Education Authority the Department of Architecture of the Leeds School of Art has been placed on the list of architectural schools "recognised" by the Royal Institute of British Architects. It is believed that Leeds is the first school of art to have recognition granted to its Department of Architecture. The recognition has been granted after visits of inspection by deputations of the R.I.B.A. and marks their approval of the work done and the curriculum of study arranged by the Department. As a consequence of recognition students passing satisfactorily through a prescribed course of study become exempt from the R.I.B.A. Intermediate Examination.

New Hindu University, Benares.

On the 4th inst. Lord Hardinge laid the foundation-stone of the new Hindu University buildings which are to be erected at Benares. The estimated cost of the new university will be three crores of rupees—about £2,000,000.

Monuments to Zeppelin Victims.

The *Petit Parisien* announced in a recent issue that in order to commemorate the Zeppelin crimes in Paris that newspaper will offer to the city a monument dedicated to the memory of the innocent victims of the aerial bombardment. The monument would be erected in a square in the populous quarter flown over by Zeppelins, and will bear the names of the victims. It will be, says the journal, an eternal stigma upon the guilty, and will recall to future generations the duty of remembrance and of hatred.—Central News.

British Hospital for Corfu.

With a large part of the Serbian army now established at Corfu, the question of hospital accommodation has become one for serious consideration. The Chairman of the Serbian Relief Fund has received a cable from Corfu informing him that the French and Serbian authorities there would welcome the establishment of a British hospital. Accordingly arrangements have already been made by the Serbian Relief Fund to despatch such a hospital (the seventh hospital organised by the Serbian Relief Fund) to Corfu, and Mr. E. P. Warren, F.S.I., F.R.I.B.A., has been appointed administrator.

Local Characteristics of Work.

At a recent conference at the Holborn Restaurant of the Drapers' Chamber of Trade Professor Lethaby spoke of the things made and sold in this country which no one wanted or ought to want. Yet, he said, we went on fattening the white elephant. Every little town should strive to produce its own little productions and to give them a local characteristic. These should take the place of those "horrid little china coats of arms articles." Every hotel in Europe called a smoked ham a York ham, although the pig probably perished in a sty next door. That showed the value of a local name. Towns must be improved, railway-stations must be improved.

Liverpool Cathedral.

The effect of the war on the progress of Liverpool Cathedral was touched upon by the Bishop of Liverpool at the annual meeting of the General Committee. The Bishop remarked that three courses were open to them. First, to carry out their original purpose and try to raise a sum of £40,000 to complete the cathedral choir and central space by midsummer of next year; second, to stop building altogether until the return of peace; and the third to complete the shell of the choir and central space, roof it in, and, having made it weather-proof, to wait until the war was over. The first course seemed impracticable, the second presented serious difficulties. The committee therefore adopted the third course.

Housing and Land Schemes.

Arrangements are being made by the National Housing and Town Planning Council for a National Congress to be held in the Caxton Hall, Westminster, on four days in the second week of April, to consider problems relating to housing and agriculture, and the possibility of averting unemployment in the building trade after the war. Among the subjects of discussion mentioned in the preliminary programme are:—The preparation of housing schemes to be put into operation at the close of the war. The provision by the Government at the time of the capital required to enable such schemes to be carried into effect. The need of financial aid by the Government to local authorities in the preparation of schemes for the clearance of insanitary areas. The preparation of afforestation, reclamation, and town-planning schemes. It is not suggested by the promoters of the conference that the State should provide capital for building purposes before the close of the war, but it is urged that schemes should be prepared and all the preliminary details completed.

French Tribute to M. Raemaekers.

The Paris correspondent of the *Times* says, under date February 6:—The festivities in honour of M. Raemaekers officially began to-day with his decoration with the Cross of the Legion of Honour by Forain, the well-known French cartoonist, at a very informal gathering of the artistic community in Paris. Among the ceremonies arranged in his honour are a reception at the Hôtel de Ville, a banquet at the Quai d'Orsay, and a public reception at the Trocadéro.

Belgian Architecture and History.

Mr. John Slater, F.R.I.B.A., presided on Monday afternoon at the Royal Society of Arts at the first of the Fothergill Lectures, when the Rev. Herbert West, A.R.I.B.A., gave an address on "Belgian Architecture and History." The Chairman, in introducing the lecturer, said he hoped the Germans would not add to their crime of demolition any attempt to restore according to their own ideas what they had so ruthlessly destroyed. The Rev. H. West proceeded to trace the growth of the cities of Belgium, and pointed out how the country had in the past been the scene of constant battles. Only one other country had suffered in a similar way, viz., Palestine. For centuries Palestine battled with the savagery of the Assyrians, and later it was the scene of the contest between Christianity and its progress and the stationary militarism of Mahommedanism. Now on the soil of Belgium the old question of whether mankind should have free development or should be subject to military despotism was being fought again. The lecturer exhibited a large number of slides of the trade halls, churches, and other historic buildings of Ypres, Tournai, Bruges, Courtrai, Ghent, Liége, Arras, Louvain, Malines, Antwerp, Namur, Brussels, etc., and in the case of Ypres, Louvain, and Dinant showed photographs of the wanton destruction by the Germans.

Trade After the War.

The Report of the Sub-Committee of the Advisory Committee to the Board of Trade on commercial intelligence with respect t measures for securing the position after the war of certain branches of British industry is published as a White Paper. The recommendations of the Committee include the following:—

Larger funds should be available for the promotion of scientific and industrial research and training, and Universities should be encouraged to extend research work devoted to the needs of the main industries in their respective districts.

The law as to the compulsory working o patents should be more rigorously enforced and the fullest possible information as t enemy patents should be given to British firms during the war.

All German and Austrian goods imported should be marked with an indelible mark "Made in Germany" or "Made in Austria Hungary," and goods from other foreign countries should be marked either with the country of origin or with the words, "Foreign Made" or "Not British."

An impartial tribunal should be set up t secure that no preference is accorded to trader in other countries by British shipowners or b home railways, and the canal system should b improved and extended as soon as the nationa finances permit.

Joint-stock banks should be invited t consider the possibility of affording a greate measure of assistance to British industria enterprise, and all Government and loca authorities should be under legal obligatio to purchase, so far as possible, only goods produced within the British Empire.

Trade exhibitions should be held under the control of the Board of Trade, and shoul not be organised with a view to attractin the general public.

Consular officers should be directed to repor cases of infringement of British trade marks o attempts to pass off foreign-made goods a British.

The Government should be urged to conside anew the advisability of establishing a separat Ministry charged solely with the safeguardin and extension of British industry and trade.

ILLUSTRATIONS.

Wren's Churches.

WE illustrate St. Augustine's, Watling-street, St. Margaret's, Lothbury, and the very interesting Church of St. Michael, Queenhithe, now de- lished. Our illustrations are reproduced m "The Churches of Sir Christopher Wren," J. Clayton, published by Messrs. Longmans, een, Brown, & Longmans in 1848, and ich we give by the courtesy of Messrs. ngmans, Green, & Co. Further notes on Augustine and St. Margaret will be found on 119.

Museum at Caerleon, Monmouthshire.

VE think these interesting measured draw- s illustrate the absurdity of the work of the ek Revival as applied to modern buildings, l possibly the paucity of buildings more rthy of close and careful study in the ghbourhood. Wherever the Greek enthusiast ctised he showed in his work his utterly lost se of the quality of appropriateness, whether vas an Elmes, a Smirke, or a lesser archi- t who was designing.

xtensions to the Harris Academy, Dundee.

THIS was a competition held by Dundee ool Board, and confined to architects ctising in Dundee. Ten sets of plans re submitted by six architects, and the essor was Mr. Alexander N. Paterson, R.I.B.A., A.R.S.A., Glasgow. The design ced first was by Mr. A. W. D. Keith, entiate R.I.B.A., Messrs. Maclaren, Sons, Soutar were placed second and third, and Findlay and Mr. Keith were bracketed al for fourth place. Mr. Keith was awarded work to carry out, and Messrs. Maclaren, ns, & Soutar and Mr. Findlay received miums.

The assessor states in his report that the k of the competing architects was one of at difficulty owing to the awkward distri- ion and gradients of the site provided and unsatisfactory character of the present lding. Further, that none of the designs entirely satisfactory, but that in the ign placed first the necessary modifications concerned with issues less vital and more ly dealt with than in any of the others. assessor also states that the design is pact and workable, that good use is made the present building, that the ventilation been carefully considered, and that the hor's estimated cost, £20,050, is accurate pre-war rates. This cost is £2,000 below estimate of the Board. The first design is outcome of a careful study of the original ding. Owing to the levels of the site re is an unused basement about 7 ft. deep w the whole of the present building. The s are shown underpinned, so that a ceiling ht of 8 ft. has been obtained, and this e is occupied with cloak-rooms and dining- n. The floor of the new extensions is lower, and on this level are placed the d and metal classrooms and the cookery- n. The building thus becomes four stories over its whole area, so saving a deal of ground space.

he lower ground-floor plan is well arranged, the lighting will require to be improved laces.

he ground-floor plan shows classrooms primary students. The two classrooms he north-west are very near the boundary at the mercy of the adjoining proprietors ar as lighting is concerned. Staff-rooms placed in mezzanines over, above the lmaster's room, and at this part there are t or nine floors each about 8 ft. ceiling e each other. This compactness is hardly ified in such an important school, but the of plan is very common in the district.

he first-floor plan shows secondary class- ns and laboratories, and on the second are classrooms and art-rooms.

he design placed first is the only one which oughly grasps the principle that playgrounds a part of school design equally with class- ns, and the large straightforward playing es provided are in contrast to the pro- ns in the other plans. The design is very compact both in plan and in section, and a fair compromise has been made between compactness and adequate lighting and ventilation. Generally speaking, this solution of the problem weighs up all the requirements and all the limitations of the site with great care.

The design placed second is good for its place. The authors have sought for spaciousness in planning, and they have perhaps gone farther in this direction than need be. The stairs are well placed and the plan shows a roomy, well-lit building. Advantage has been taken of the difference in site level to introduce a basement floor in the north-east block. This floor includes wood and metal classrooms and dining-room. The ground floor contains primary classrooms, entrances, cloak-rooms, cookery-room, and gymnasium. Four entrances are provided for juniors and seniors of both sexes, but these entrances as shown do not give the maximum of convenience and separation. Valuable playground space would have been saved had another story been added to the north-east block and two stories over the boys' cloak-rooms. Low building on a site so much restricted is inadmissible. The first-floor plan is very straightforward and shows the scheme at its best. There is a difference in level between the floor of the present building and the south-east block, necessitating steps in the corridor. In practice this would not cause any trouble as the steps are well lighted. It is unfortunate that two of the primary classrooms are on this floor. On the second-floor plan two of the art-rooms are awkwardly shaped, but otherwise the plan shows well. There will probably be some difference of opinion as to the utility of the playground and latrines on part of the roof.

The design placed third, while of itself good, is not at all suitable for the site. Most of the classrooms have their windows too near the boundaries, and the playgrounds are very broken up. This scheme would require great economy to bring it in at the Board's estimate.

The assessor is worthy of compliment on the clear and reasonable way in which the conditions of the competition were drawn up and also on the fairness of his award; and the Board are to be congratulated on having got a design which will give them satisfaction in working at a very reasonable cost.

It is understood that the drawings are to be prepared and held in readiness for the commencement of building operations immediately on the termination of the war.

No. 4, New Burlington-Street, W.

THESE premises have been recently rebuilt as a woollen warehouse for the owners and occupiers, Messrs. John G. Hardy, Ltd. The front shown is of Portland stone. Messrs. Dove Brothers were the builders and Messrs Niven & Wigglesworth were the architects.

Design for the Third Church of Christ Scientist.

OUR illustration shows the plans and section of the design we published in our issue for January 28.

"The Storey Institute," Lancaster.

THIS building comprises art and technical school, free library and reading-room, and art gallery.

The portion first erected in 1887–1890 as a completed building was the gift to his native town of Sir Thomas Storey, in celebration of the fiftieth year of the reign of Queen Victoria (the portion on left front in view). On the ground floor are library and reading-rooms, science laboratory, and lecture-room; on the first floor art gallery, music-room, and museum; and school of art studios on the second floor.

The enlargement and additions to the building is the generous gift to the town of Mr. H. L. Storey, D.L., J.P., the eldest son of the late Sir Thomas Storey, and contains on the ground floor large electrical laboratory and metal and other workshops, and manual instruction room; on the first floor cookery and laundry rooms, classrooms, and cloak-rooms; and on the second floor an extension of the art school, with cloak-room and offices, and also enamelling and pottery kiln, etc.

The whole of the work has been carried out from the designs of Messrs. Austin & Paley, architects, of Lancaster, by the following firms:—

1887–1890 PORTION.

Mason—The late Mr. W. Warbrick, Lancaster.
Carpenter and joiner—The late Mr. C. Blades, Lancaster.
Slater and plasterer—The late H. Hartley & Sons, Lancaster.
Plumber and glazier—Messrs. Calvert & Heald, Lancaster.
Painter—Messrs. Eaton & Bulfield, Lancaster.
Heating—Messrs. A. Seward & Co., Lancaster.
Laboratory fittings—Messrs. Pearson & Brown, Manchester.

1906–8 PORTION.

Mason and joiner—Mr. R. Thompson, Lancaster.
Slater and plasterer—Messrs. T. & J. Till, Lancaster.
Plumber and glazier and gas and electrical engineer—Mr. R. P. Wilson, Lancaster.
Painter—Mr. John Taylor, Lancaster.
Fittings—Messrs. J. Hatch & Sons, Lancaster.
Heating—Messrs. Saunders & Taylor, Manchester.

◆

CORRESPONDENCE.

St. Martin, Ludgate-Hill.

SIR,—In reference to your account of St. Martin, Ludgate, the date for completion (probably a slip) is given as 1634, when Wren was two years old, instead of 1686; and for the sake of reference I should have liked to see a note added to the sheet of plan, sections, etc., to say that the internal arrangements shown are not those existing now, the alteration having been made in 1895.

LEWIS GILBERTSON (Rector).

The Monuments of Liverpool.

SIR,—I read with interest your article on "Monuments of Our Provincial Towns" in your issue of January 28. May I be allowed to make a small correction therein? The monument on the Exchange Flags to Lord Nelson was designed by Matthew Cotes Wyatt and modelled and cast in bronze by Richard Westmacott, and completed on October 21, 1813.

T. E. ECCLES.

Re Painters' Rates of Wages.

SIR,—Referring to a letter over the signature of Mr. J. Bancroft in your issue last week, I beg to point out that the arbitration in question was between the London Master Decorators' Association and Mr. Bancroft's Society, to which the London Master Builders' Association was no party, and, moreover, the question of rates of wages was not included in the award.

The references in Mr. Bancroft's letter to the London Master Builders' Association should therefore be ignored.

In conclusion I am to submit that the rate for painters you give for the London building trade is correct.

S. B. DEPREE,
Secretary, The London Master Builders' Association.

Scaffold Tie Patents.

SIR,—In your issue of January 28, under "Selected Patents," prominence is given to Patent No. 17,474, dated as long ago as the year 1914.

As proprietors of the Scaffixer patents, may we bring to your notice the fact that when a patent for the appliance described as 17,474 of 1914 was applied for we (the Patent Rapid Scaffold Tie Company, Ltd.) successfully opposed the granting of a patent for it, and we were in addition granted costs as against the applicant?

"Patent No. 17,474 of 1914" therefore does not exist, a fact which, after the publication referred to, should, we think, be made known to the trade.

THE PATENT RAPID SCAFFOLD TIE COMPANY, LTD.,
D. PALMER JONES, Managing Director.

THE LONDON COUNTY COUNCIL.

THE fortnightly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. Cyril Jackson, Chairman, presiding.

Loans.—Loans were granted to Metropolitan Borough Councils as follows:—£13,000 to the St. Pancras Borough Council for electricity purposes; £3,290 to the Woolwich Borough Council for electricity undertaking.

Decoration of Certain Council Schools.—The Education Committee reported that certain of their members had conferred with the undermentioned artists representing the Professional Classes War Relief Council:—Mr. W. R. Colton, A.R.A., Mr. John Hassall, R.I., Mr. M. Spielmann, and Sir Aston Webb, K.C.V.O., C.B., R.A., and after visiting several of the schools with a view to deciding which, in their opinion, would be best suited for their purposes, the representatives of the War Relief Council have recommended the first floor (boys') hall of the Devon's-road School (Bow and Bromley), in which to carry out their first scheme of decoration. They have submitted to the Committee in outline an "Empire" scheme of decoration illustrating life and industry in the British Dominions beyond the seas. On the recommendation of the Education Committee the scheme was approved.

Staff.—The Parks and Small Holdings and Allotments Committee have authorised the temporary employment of carpenters in the work of building and repairing boats at parks and open spaces.

Clapham Common.—The Parks and Small Holdings and Allotments Committee have agreed to a proposal made by the Wandsworth Borough Council for the addition to the public footway of a strip of land forming part of Clapham Common, next the shelter and women's conveniences near Clapham Cross.

Victoria Embankment Gardens.—It has been decided that the Temple and Whitehall sections of the Victoria Embankment Gardens shall not be opened until 9 a.m.

Statistical Abstract for London.—Volume XVI. of the Statistical Abstract for London has been completed and will be placed on sale.

Bow-road and East India Dock-road Tramways.—The Highways Committee reported that they had arranged for the tramway margins in Bow-road and East India Dock-road to be repaired by the Poplar Borough Council at a rate of 8s. 11d. (plus 10 per cent.) a lineal yard for stone paving, and 9s. a lineal yard for wood paving. The expenditure is estimated at £400.

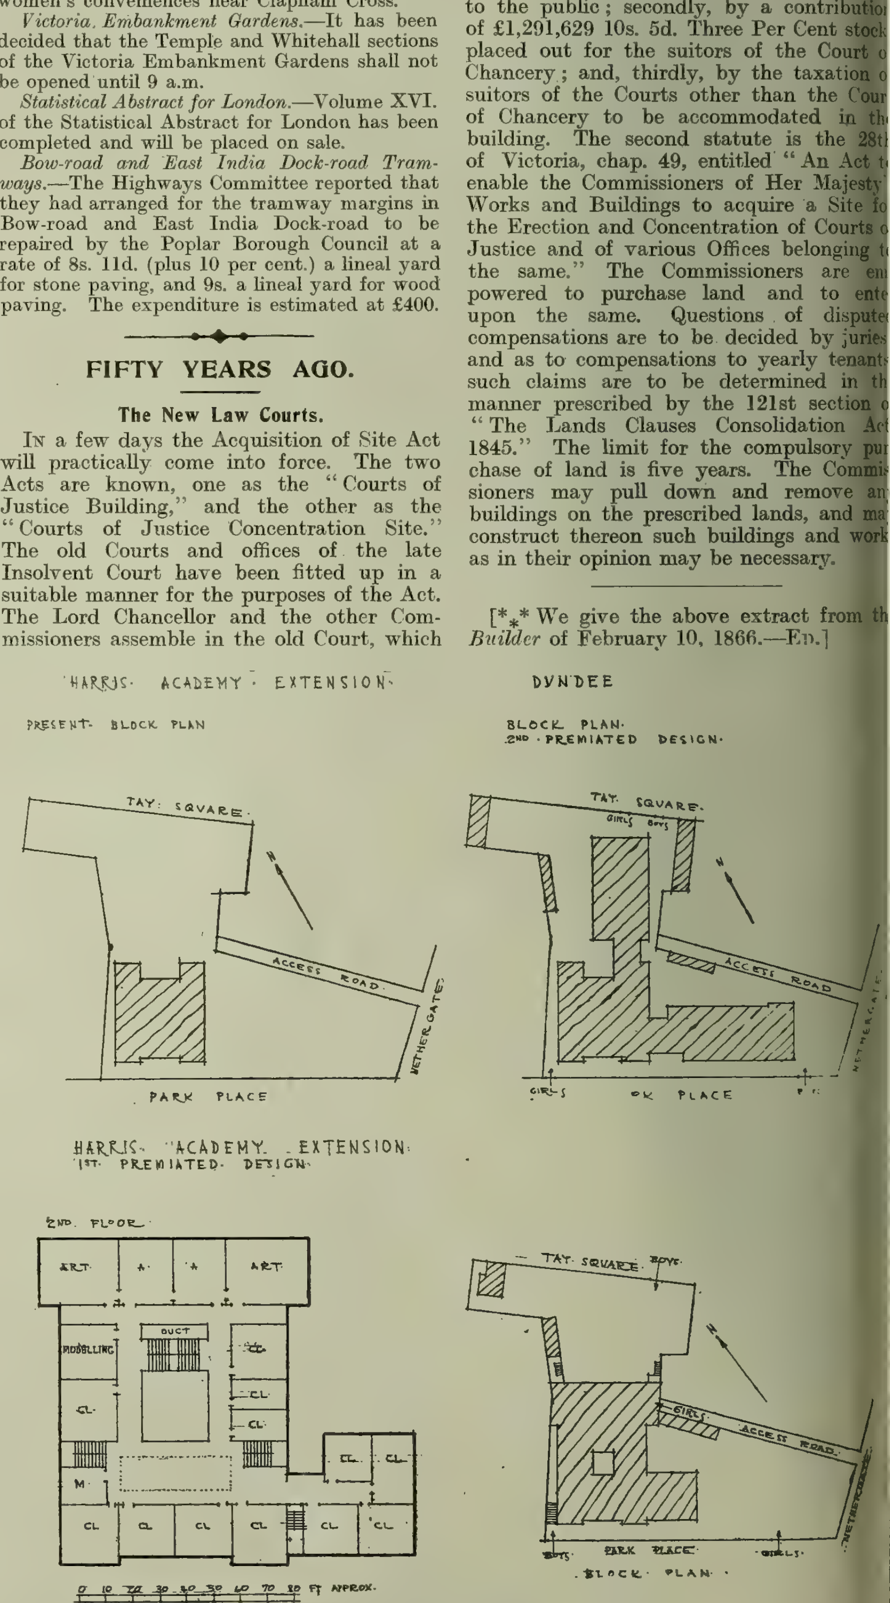
◆

FIFTY YEARS AGO.

The New Law Courts.

IN a few days the Acquisition of Site Act will practically come into force. The two Acts are known, one as the "Courts of Justice Building," and the other as the "Courts of Justice Concentration Site." The old Courts and offices of the late Insolvent Court have been fitted up in a suitable manner for the purposes of the Act. The Lord Chancellor and the other Commissioners assemble in the old Court, which has been very much improved in appearance, and the new Court, called "The Courts of Justice Compensation Court," wil be held in the Court where the late Mr. Commissioner Phillips presided. The first statute in the new Courts is the 28th o Victoria, chap. 48, entitled "An Act t supply Means towards Defraying the Expenses of Providing Courts of Justice an the various Offices belonging thereto, an for other purposes." The cost of erectin the Courts will be borne by money provide by Parliament to the extent of the value o property surrendered, and of relief to th public by the cessation of rents now charge to the public; secondly, by a contributio of £1,291,629 10s. 5d. Three Per Cent stock placed out for the suitors of the Court o Chancery; and, thirdly, by the taxation o suitors of the Courts other than the Cour of Chancery to be accommodated in th building. The second statute is the 28t of Victoria, chap. 49, entitled "An Act t enable the Commissioners of Her Majesty Works and Buildings to acquire a Site fo the Erection and Concentration of Courts o Justice and of various Offices belonging t the same." The Commissioners are em powered to purchase land and to ente upon the same. Questions of dispute compensations are to be decided by juries and as to compensations to yearly tenants such claims are to be determined in th manner prescribed by the 121st section o "The Lands Clauses Consolidation Act 1845." The limit for the compulsory purchase of land is five years. The Commissioners may pull down and remove an buildings on the prescribed lands, and ma construct thereon such buildings and work as in their opinion may be necessary.

[*** We give the above extract from th *Builder* of February 10, 1866.—ED.]



Harris Academy Extension, Dundee. (*See page* 123.)

CIVIC DESIGN SECTION.

Lower Mall from the Bridge.
(From "The London County Council Survey of London: Vol. VI.—Hammersmith.")

THE DEVELOPMENT OF TOWN PLANNING.

T is unfortunate for the progress of the town-planning movement that the war should have come so soon after attention had been directed to the importance of a larger nore communistic spirit in the development own and country. Initially all great ovements are bound to involve considerable nditure, and at the present time we suffer the want of adequate data as to the ased revenue which may be derived improvements which often seem to ve sacrifice of revenue-producing space. in the near future, when peace returns we are confronted with the conditions of w world in which the demands on finance be multiplied, money will be very dear, the tendency must be to restrict its uses nterprises involving the fewest speculative ents. Instead of an age of idealism we expect a greater emphasis to be laid on ractical requirements of our daily life. In words, the results of war will be to nasise the practical and commercial element r lives, and architects and artists will be l to bear this in their minds. The poetry r life must arise out of the picturesqueness rge conceptions applied to utilitarian nes, and the great movements of the near e should be evolved from the wants of a nercial present rather than from poetical rtistic abstractions.

e development plan of Greater London, n is being carried out through the agency of London Society, is highly practical and tune, since by it the organised relief to ects during the war is effected, while it e first and necessary step towards the lination and understanding of the immense ems which have to be solved before the merated area of developed land which all London can be reduced to a logical

en finished, the plan will contain imagi- e proposals, founded on ascertained facts, lown for the first time in complete form: rterial roads recommended by the London c Branch of the Board of Trade, with sted modifications; also an endeavour to linate the numerous town-planning schemes l London, combined with an attempt, by s of a Parkway system, to link up as far as possible the 2,000 open spaces in Greater London.

Thus for the first time the future requirements of Greater London will have been studied as a whole and shown in a complete and comprehensive manner. The cost will be about £1,000, apart from the cost of reproduction. This large sum is being provided independent of the Society's funds, and spent entirely in giving employment to the draughtsmen engaged on the plan, the directors and others interested giving their time and services without charge, and the Society lending their premises free of all expense.

To give some idea of the extent of the work which is being attempted it may be stated that when completed the plan will be about 20 ft. square, the ground treated covering an area of approximately 700 sq. miles. The plan can be seen in course of preparation by members and friends at any time at the Society's offices, and at the conclusion of the war it will be publicly exhibited as the Society's contribution to the development of London.

Local authorities have substantially agreed among themselves as to the course of the proposed new arterial roads, but the difficulty of devising machinery for obtaining funds to carry them out will be greatly increased by the war, and it will be less easy to prevent local development which would interfere with the schemes laid down, the postponement of which for reasons of finance may be expected.

In Birmingham the question has been settled by consent, those having sites abutting on new arterial roads paying for the cost of 40 ft. of the road, the cost of the width in excess being met partly by the ratepayers and partly by the Road Board. Such a plan, admirable in its way, can only apply to undeveloped districts, the problem of effecting improvements in developed districts being much more complicated.

Before the war the relative advantages of Betterment and Recoupment were under consideration here and abroad. Betterment consisting of charging properties the value of which can be shown to have improved with half the value of the improvement, and Recoupment by means of which a local authority is enabled to buy more land than it requires in order to sell it at a profit, the only successful application of which in London is Northumberland-avenue and in Paris the Champ de Mars. It is possible that the results arising from Betterment might be different if the areas scheduled were greater and the period in which the improvements were held to be created were extended from three years to ten or more.

But unless mutual co-operative schemes between owners of town property in districts where new roads are required can be agreed upon it seems likely that the financial results of war will be to make it necessary to wait longer for the institution of much-needed improvements in our towns, and that a large part of the town planner's activities must be directed towards getting such an amount of support as will secure the adoption of necessary schemes in principle and the laying down of restrictions which will prevent smaller improvements being made which would be inconsistent with them, for available funds will, in the near future, be taken up with the provision of absolutely necessary housing and industrial developments in the direction of the erection and financing of the warehouse, factory, and shipping facilities necessitated by the greater part which we believe this country will have to play in the world's commercial life.

LONDON COUNTY COUNCIL SURVEY OF LONDON.*

THE parish of Hammersmith was until 1834 part of Fulham, and it is rightly associated with the northern shore of the Thames between Fulham and Chiswick, though, in fact, only a small part of the parish lies along the riverside, the remainder stretching northward as far as the Harrow-road. The origin of the name is obscure. It is stated that an early form was Hermodeswode, but it may have been Hamers Mythe (O.E. for the mouth of a river), as a reference to Rocque's map shows that which is now called the Creek, and divides the Upper and Lower Mall, was as late as 1745 the mouth of a considerable waterway, which would have been the ideal place for an early settlement.

To the architect the chief interest of this admirable publication lies rather in the illustrations of Old Hammersmith than in the 143 pages of descriptive letterpress which accompany them.

---

* Issued by the Joint Publishing Committee representing the London County Council and the London Survey Committee. Vol. VI.—Hammersmith. (Published by the London County Council, Spring-gardens. 25s.)

Bradmore House, which has been fortunately preserved and re-erected to form the offices of the London General Omnibus Company, is shown in some twenty plates, the fine woodwork being refixed in a billiard-room, to which, by arrangement with the London County Council, the public is given access once a month. We illustrated the building in our issue of April 16, 1915.

Old St. Paul's Church is illustrated by a reproduction from an old drawing, and photographs of the pulpit removed from All Hallows, Thames-street, and the monument to Sir Nicholas Crispe. Vincent House, Kent House, 11 and 12 and 21 and 22, Lower Mall are shown by drawings and photographs, which prove how rich London is in fine old Georgian houses. We should have liked to see Hampshire House, which is of great interest and charm, rather more amply illustrated than it is by the general view and wrought-iron gateway detail. Sussex House, Upper Mall, is a good and typical Georgian piece of brickwork, with a delightful doorway shown on plate 62. Kelmscott House—the residence of William Morris—River House, and 22, Upper Mall are shown by a general plan, and some good photographs of Kelmscott House show its details to advantage. The "Queen Dowager's" House in the Upper Mall is reproduced from old drawings. Hyde Lodge, Upper Mall, is a characteristic simple Adam design; while Upper Mall House represents the more vigorous early period.

The Library, Ravenscourt Park, with its fine staircase and ironwork, and representations of the older taverns, appropriately complete the volume, together with Blythe House, with its dignity and Greek mannerisms. The carefully-prepared map, in which the buildings recorded and illustrated are shown in red on a plan, will readily enable the wayfarer to find his way about the historic quarter of Hammersmith, especially as it is comprised within a narrow belt along the river's edge and south of the Hammersmith-road, Broadway, and King-street. Within this district, ⅞ mile long and ¼ mile broad, are to be found all the objects of interest dealt with in the volume, and, while they are not equal to either Chelsea or Greenwich in architectural importance, the undeniable character and interest of Old Hammersmith must be recognised by all lovers of art. It is almost unnecessary to add that the volume is prepared with the accuracy and care of the previous volumes which we have reviewed.

THE ORGANISATION OF BUILDING AFTER THE WAR.

We have before us the preliminary programme of a National Congress to be held under the auspices of the National Housing and Town Planning Association at Caxton Hall from Tuesday, April 11, to Friday, April 14. The subjects to be dealt with are:—

1.—(*a*) The preparation of housing schemes for the building of urban and rural cottages, these schemes to be put into operation at the close of the war, so that the danger of serious unemployment in the building trades may be avoided. (*b*) The provision by the Government at the close of the war of the necessary capital to enable such schemes to be carried into effect. (*c*) General housing finance at the close of the war.

2.—(*a*) The need for financial aid and encouragement being given by the Government to local authorities in the preparation of schemes for the clearance of insanitary areas. (*b*) Consideration of the results in the better citizenship and greater productive capacity following on the raising of the standard of life of the people as a result of the improvement of housing conditions.

3.—(*a*) The provision of homesteads with small holdings, and the intensive cultivation of land. (*b*) The reorganisation and extension of the methods by which capital can be provided to aid all classes of cultivators of the land, so that the rural resources of the kingdom can be adequately developed. (*c*) The possibility of carrying into effect schemes for settling disabled soldiers and sailors on the land. (*d*) The preparation of schemes for afforestation, and for the reclamation of waste lands.

4.—The preparation of town-planning schemes in anticipation of future developments, and more especially schemes for the construction of new arterial roads, playgrounds, and other open spaces, so that if employment is needed for unskilled workmen at the close of the war these workmen can be employed at tasks of real service to the community.

5.—The possibility of adopting new and cheap building materials and securing economies in the design of cottages, provided that the essential standards of good building construction and of the wholesome environment of dwellings are not impaired.

In an explanation of the objects aimed at it is pointed out that, although we may with some truth assert that we had little reason to anticipate war, we have no excuse for not anticipating the advent of peace, which we know is a certainty sooner or later, and that when peace comes we may have to face a situation which, if we are unprepared, may entail on posterity evils equal to or greater than those of war itself. Although in the shipbuilding and mining industries it is possible that the returning labour may be utilised and absorbed at once, this cannot be said to be the case with respect to building, unless steps are taken in good time, and, though by slow demobilisation this danger can be in part averted, the cost of such a policy would be very great, while the industrial waste involved would be practically that entailed in the institution of most forms of relief waste. It is pointed out that if 200,000 building trade workmen are kept "with the colours" in order not to flood the market they will cost in food, shelter, clothing, and allowances to dependents at least £2 10s. a week, or £500,000—*a sum which, if devoted to setting workmen to construct cottages, would in the course of six months defray the cost of building* 65,000. It is clear therefore that by the proper preparation for peace in the building trades, and no doubt in many other industries, a sum can be saved compared to which the economies which many of those in authority are devoting much time and many speeches to are absolutely trivial.

It is hoped that the appointment of a National Deputation will be approved by the Congress, and that this National Deputation will place the proposals of the Congress before the Government.

The shortage of houses is placed at at least 400,000, of which 120,000 are in rural districts, and that the provision of necessary housing accommodation requires an annual expenditure of £25,000,000 to £30,000,000.

It is not suggested that the State should provide capital till the end of the war, but that the consideration of schemes and plans should be dealt with now; for after the depletion of the national exchequer by war it is more than ever necessary that the community should have the full advantage of the expenditure of money available when peace returns.

Invitations to attend the Congress are being sent to the various city, urban, and rural authorities in Great Britain, and the membership fee of 21s. will cover the cost of printing and circulating all reports and papers published in relation to the Congress. Any questions relating to the programme should be sent to Mr. Henry R. Aldridge, the Secretary, at the offices of the National Housing and Town Planning Council, 41, Russell-square, London.

We consider the proposals made are exceedingly important and practical, and trust in the interests of the community that the Congress will meet with the fullest measure of success.

HOUSING IN WALES.

The Report presented to the annual meeting of the South Wales Garden Cities and Town Planning Association, at a meeting held at the Engineers' Institute, Cardiff, recently, indicated that considerable progress had been made during the year. Mr. D. Lleufer Thomas, who presided, moved the adoption of the Report, this being seconded by Mr. J. T. Clatworthy and unanimously carried. The Chairman moved the re-election of Lieut.-Colonel David Davies, M.P., as President. This was seconded by Lieut. Henry Davies, and carried. Mr. D. Lleufer Thomas was unanimously re-elected Chairman, and Mr. Lovat Fraser Hon. Treasurer.

Mr. Alwyn Lloyd read a paper (written
the Treasurer) on "Housing and Town Planni
in Relation to Unemployment and other Afte
War Problems." There must, said Mr. Frase
be no panic after the war. The abnorm
activity would come to an end, to be followe
after a year of depression, by feverish activi
owing to the rebuilding of the ruined countri
This might last for three or four years, b
this, he predicted, would be followed by lo
years of depression. To provide employme
it was suggested the Government should und
take the problem, and Mr. Seebohm Rowntr
had suggested the extensive erection of workin
class houses. Public authorities shou

THE SURVEYORS' INSTITUTIO

An ordinary general meeting of the S
veyors' Institution was held on Monday
No. 12, Great George-street, Westminst
S.W., Mr. A. L. Ryde in the chair.

The minutes of the previous meeting w
read and confirmed.

It was announced that nine publications
been received for the library, in addition
two donations of two guineas each, and it
agreed that the thanks of the Institution
sent to the donors.

Mr. Charles F. Slater (Fellow) then rea
paper entitled "Dilapidation Practice: S
Notes and Suggestions," in the course
which he commented on:—

(1) Instructions and survey;
(2) Special covenants;
(3) Dilapidation during war;
(4) Schedules of condition;
(5) The effect of dilapidations on the v
and marketability of property;
(6) The Report of the Land Inquiry C
mittee on Dilapidations.

In the year 1844 the R.I.B.A. formul
a definition of dilapidations as follows:—

"For practical purposes dilapidations
in usual practice understood to be t

cts only which have arisen from neglect isuse, and not to extend to such as only ate age, so long as the efficiency of the remains. But if the effects of use or have proceeded so far as to destroy the or its efficiency in the structure, this es neglect or misuse, it being the pre- tion that at the commencement of his the tenant was satisfied that every part sufficiently strong to last to its close." definition formed a common basis of prac- for seventy years.

Survey.

the course of the paper the author :—

Every surveyor will have his own notions e order in which he takes his particulars specification of dilapidations. My own rence is for exterior of main building then the interior from top to bottom, by room, and lastly the appurtenant lings and grounds. In country work it pecially necessary to check off very care- at the finish the description of the ises in the lease and plans with the lings inspected, making quite sure nothing been missed. It is annoying to find that om's cottage about a mile from the man- has been overlooked. The dimensions of room, including the height, are well h taking as a means of checking the urement of work, but not in substitution of. This applies to exterior measurements. am told it is quite an easy matter for a ised hand to run through a moderate- house and put his figures on a half-sheet per, but this method is not to be com- led, however experienced the surveyor be. I remember watching a bout between ss-examining K.C. and a witness armed one of those half-sheets. I am sure the ess in question actually knew this work better than I do, but the half-sheet of r produced on the face of the Referee a of holy horror which boded ill for the ess. Needless to say, floor plans are fre- tly useful, as well as scale sketches of rtant parts. The camera is not to be sed. In the preparation of a specifica- for the landlord the qualified surveyor turally careful to include only such work roperly can be claimed. In settling a qualified man there is little difficulty. metimes claims are made on incomplete uctions or on imperfect knowledge of law facts. In meeting such claims a general round at the first evidence of excess may se the necessity for particular care in g objections. Experience is the only of what to observe. If a fight should , the value of sketches in illustration of jection and made at the first survey are valuable.

Measure of Damage.

estimating dilapidations regard must be o the legal principle that the measure of ge is limited to the depreciation in value e reversion. At the end of the term r according to covenants or the cost of is generally all we have to trouble , as that is fairly clearly the measure of ge to the reversion. The distinction een damage to reversion and cost of rs would appear to be easy of applica- in a case where a lessee, say for twenty- ears, covenanted to paint in each seventh and had not kept strictly to the time- . He could not be penalised in damages g the term unless damage could be shown e reversion, but if, for instance, he ed in the twentieth year instead of the y-first, the reversion would be depre- d, and he would be liable to paint again. raw a like distinction at the end of the where premises are coming down is not ny means so simple a matter. Where a holding under full repairing covenants s the fabric to fall into such disrepair at the end of the term the lessor has ically no alternative but to rebuild, the t compensation should be made to the for the damage he has sustained. But a lessee holding under the like ants has kept the fabric of his building od repair, and the lessor finds that owing anges in the neighbourhood it will pay o pull down and rebuild, he should not be entitled to damage, which in fact his reversion has not sustained. This is not universal practice, but it has always seemed to me to be the proper interpretation of the legal principle of damage to the reversion.

Where there is an Express Contract to Repair—Tenant's Obligation.

It is necessary to observe the distinction between a general covenant to repair, which impliedly covers all buildings on the land demised, and a repairing covenant which is limited in terms to the buildings demised, for the latter will not be extended to newly-erected and distinct buildings. It has been contended in some quarters that there is a hardship on a lessee who, having erected buildings for his own convenience, should be compelled under a general covenant to leave them in repair. It is surely hard on a lessor to have to put in repair or clear away buildings he does not want, yet a perfectly legitimate charge for clearing away is not favoured.

It is not unreasonable to assume that on the grant of a lease a tenant is satisfied with the premises he is taking and a landlord with the rent he is receiving. The need for future additions cannot always be foreseen, but where it arises and is acted upon it seems as unreasonable for a tenant to object to repair the additions as it is for a landlord to require additional rent for granting a licence to erect them.

Under the covenant "Substantially repair, uphold, and maintain," without any specific clauses as to painting and papering, the general practice seems to be to require some reasonable preservation of decorative items. However old, the decorations if in good condition should be accepted, and, on the contrary, however new, if damaged or badly done should be renewed in keeping with the character of the property.

Dilapidations Arising During War.

A very clear and interesting statement of the law and practice on the subject of damage caused by occupation of premises by the King's Forces was put forward by our worthy President, Mr. John Henry Hanson, in his recent address (*Transactions*, Vol. XLVIII., Part 1). He said :—

"And lastly the matter is now dealt with under statutory regulations in which, save so far as may be contained in a general declaration of principle that interference should be limited to necessity, there is no provision or restriction in favour of owners, nor for payment of compensation as of right. Provision, however, has been made for such payment as of grace, the amount to be determined by a Royal Commission specially appointed to deal fairly and reasonably with the matter."

The obvious course with properties required for military purposes is the preparation of a schedule of condition of the premises at the commencement of the occupation, and this applies generally whether the property taken is urban, residential, or agricultural.

There is said to be a desire in some cases to shelve responsibility, but I have not experienced it. Petty haggling has twice come my way over decorations and furniture under agreements for tenancy by local commands. but the blame for that was less on the military authorities than on the newly-made officers.

Damage by the King's enemies, as you all know, was in the early stages of the war met by relief being given from Imperial funds, a committee being appointed by the Treasury to investigate the damage to persons and property sustained by the bombardment of the Hartlepools, Scarborough, and Whitby by German warships, the air raid on the Norfolk coast, and the air raid on Colchester and the neighbouring district. That was withdrawn last summer, and a system of Government insurance inaugurated.

So far as dilapidations go on premises that are insured, there is one point worthy of note. The Government insurance covers only the interest of the party assured. It is not sufficient, for instance, that a lessor should insure against damage by aircraft and bombardment if his lessee should be liable to him under the covenants of the lease, for in that case he would be compensated only to such an extent as he would not be entitled to recover against his lessee. I have heard of a case where Lloyds on a very open form of policy have taken the same line.

I am advised that it is necessary that in all such insurances the person assured should contract for himself and in trust for all other parties interested. Where not done in the first instance an endorsement of the policy will suffice.

Conflicting opinions exist on a lessee's liability to repair damage caused by the King's enemies. It is difficult to imagine that express covenants to repair will in such circumstances lose anything of their effect against the persons who have entered into them, especially as the contingency, however remote, could have been provided against by specific words in any covenant, and now, moreover, everyone has an opportunity to insure at relatively small cost.

Schedule of Condition of Premises.

Contested cases on dilapidations would be much diminished in number and simplified in issue if landlords and tenants entered into their respective obligations with a full knowledge thereof and with expert advice on the buildings which were the subjects of their contract. In the *Transactions* of this Institution covering the papers of Judge Wheeler and Mr. Pilditch, and the discussions thereon in 1886, it was advocated by several prominent surveyors that a schedule of condition of premises should be taken at the commencement of each lease. In the year 1903 the Royal Institute of British Architects issued a handbook on dilapidations, in which they referred somewhat extensively to this question of a schedule of condition, and in which they gave models of repairing and surrendering covenants for embodying the same, together with a note of the practices obtaining in Continental countries. The report on condition of the premises which the R.I.B.A. suggested should be added to every lease was in the form of an award by one, two, or three surveyors acting after the manner set forth in sect. 91 of the London Building Act, 1894. It should detail—

(1) The premises comprised;
(2) The construction of the buildings;
(3) The defects.

"A full description of the premises and of the forms of the whole and parts to be given; all rooms, or other sub-divisions of the premises, to be named or described; also accesses, passages, staircases, etc. This may be usefully accompanied by plans.

"The nature of the construction to be set forth, as also the materials used for walls, rooms, partitions, floors, windows, and doors, and any special decoration.

"A list to be given of the defects observed on a survey made on the date stated in the report; importance to be given to structural defects, such as walls out of the upright, bulged, settled, broken, or cracked; floors, roofs, staircases, etc., out of level; but minor defects, whether structural or not, should also be recorded."

To carry out this recommendation to the full in every case would seem to involve a vast amount of labour including much that was unnecessary. There are cases, however, in which these instructions should be observed in detail, especially where the premises to be demised are so old or so badly constructed as to cause doubt in the minds of practical people about the fabric remaining good for the full period of the lease.

The practice of attaching a report of condition of premises to a contract of tenancy appears to be growing very slowly, and I think one of the deterrent factors is that of the cost of preparing the same."

Mr. Howard Martin, in opening the discussion, moved a vote of thanks to Mr. Slater for his paper, the motion being seconded by Mr. Graham Mould. The following gentlemen also took part in the discussion—Messrs. Wm. Woodward, Samuel Clarke, C. Herbert Bedells, and Chas. Osenton.

The Secretary announced that the next general meeting of the Institution will be held on Monday, March 6, at 5 p.m., when a paper will be read by Mr. G. Turville Brown (Fellow) entitled "The Management of Estates in Mineral Districts, and Mineral Valuations."

THE BUILDING TRADE.

THE REBUILDING OF BELGIUM.—II.

IN a preceding article* we discussed the legal conditions within which the reconstruction of the Belgian towns has been prepared for. We have made it clear that the Belgian laws have from the present time empowered the Government to give or refuse to towns or villages, or to any special place, the right to carry out the plans they have prepared.

What we wish to demonstrate here is the perfect safety of money investments which may be placed in Belgium after the war, with a view of helping in the great work of restoring the towns and villages ravaged by the enemy. Let us first take the case of a town or a village.

A municipality which has received the approval of the Government for the plans it has prepared cannot start work on this alone.

It is the rule in Belgium that the financial side of the plan must also be approved. All estimates of the cost of the work, after having been drawn up by the Finance Committee of the town, the faubourg, or the village, is presented to the Conseil Communal, which in its turn nominates a committee to study and discuss the question. When this is done a representative chosen by the committee lays before the Conseil Communal the result of their deliberations and advises as to the approval or otherwise of the estimate.

These committees are held publicly, and any criticisms are allowed and considered. In fact the inquiry is most complete and thorough.

Supposing that the scheme is finally approved by the municipality, plans and estimate are submitted to the "autorités provinciales," a permanent body composed of architects of provinces, provincial financial committees, and the Governor of the province. Only after this, if it is approved, with or without alterations, is it placed before the Minister appointed to deal with these matters.

After he has passed it comes the examination from the artistic and architectural standpoint, which is made by the "Commission des Monuments." Passed by this last committee the plan can be carried out, and from henceforth it will have the Government guarantee, as the Minister of Public Works does not sign plans unless they conform with the ideas laid down by royal decree. But the powers of the Government do not end here.

The works are inspected by their architects and engineers, by the architects of the provinces, and more particularly by the inspectors, who are constantly on the scaffolding. In considering the financial estimates for work the question most carefully studied by the authorities is that of the monetary resources of the municipality in relation to the amount they will be compelled to borrow for the work; the means of paying off this debt; and, if a loan is required, which will in general be the case, the character of the creditor, the amount of the loan, and the time for which it is to run.

Before the war, for public works, schools, churches, hospitals, etc., the Government and the provinces always granted a subsidy of from one-tenth to one-sixth of the total cost of the building.

Several questions naturally present themselves for solution.

What will be the financial position of the Belgian Government on the declaration of peace? What will be the financial position of the Belgian people, of the Belgian societies, and of the Belgian banks at that moment? What will be the extent of the damage done? These are questions which must remain unanswered. We do not know what the results will be of the months of war which are still to come; but what we do know is this, that if we were reduced to our last penny the working power of our industrious people would prove to the friendly Powers that their money, if they decided to help us, would be as securely placed as had been their confidence in our loyalty before and during the war.

We might perhaps have argued that in the event of a refusal being sent to the German ultimatum we could expect to see our country ruined and devastated and our people slaughtered, but that if in spite of that we did not hesitate to bar the road to the invaders, a true battle of pygmies against giants, sacrificing our all unanimously and unhesitatingly to our international obligations, we should in consequence expect that the countries which have benefited by our attitude would come to our aid after the war.

This argument will certainly not be used, because Belgium, unhappy but proud all the same, has resolved to rise again from her ashes, asking only for the help of her friends, help which she hopes to reward.

In the restoration of towns, suburbs, and villages it is obvious that the municipalities will only concern themselves with the plans for public buildings and of any expropriation to be made, and in that case with the allotment of the building sites.

Private buildings will be left, as everywhere else, to the initiative of individuals in so far as their plans are in harmony with the plans of the administrative bodies. In the case of someone who is compelled to build on his land, either as the result of damage done or of expropriation, and who has not the money needful, he can go to building societies which existed in Belgium before the war, and which will certainly continue their work after the war, even though they may have temporarily disappeared.

The societies, as is probably the case in England, lend money to people who wish to build, after examining the plans and the estimate of the contractor and the sum required for the completion of the building.

The repayment of the sum lent is usually done by annual instalments, the interest being about 4 per cent. and the duration of the loan from ten to thirty years.

Here again these matters are arranged so as to ensure perfect security.

In proportion to the progress of the building the contractor is paid by the society itself, and only after searching inspection of the work done and of the materials used. A sum amounting to a tenth part of the estimate remains in the hands of the society until the work is definitely approved, which is done a year after the building is finished, by the architect of the building and the experts of the society. Consequently, as far as the building goes, the society runs no risks, and the same precautions are taken with regard to the property itself. To this end the society holds a mortgage on the house and ground of the value of the sum lent, until the loan contracted by the owner is entirely paid off.

The mortgage is hedged with so many conditions that the creditor can feel perfectly secure, and need not trouble further beyond making sure that the property is in a good state of preservation.

The work of these societies had such a wide range before the war that there were very many clerks and workpeople who owned their houses.

The big towns and even the unimportant ones increased rapidly with their new suburbs of little one-storied houses, neat, pretty, and individual in character. The payments made by those small owners were very little higher than the rent of a house of the same standing as their own, and they usually found it best to insure their lives, which would leave the property unencumbered in the event of their death.

Thus it is clear that if, as a result of the war, the building societies will not be in a position to operate with their own capital, allied financiers need not fear to invest their clients' money in those enterprises which have made their mark in Belgium.

The money will increase, the capital will find it a good investment, and, above they will help in a work whose social valu of immense importance, because, to take o the question of saving (and is not thrift enemy of drink ?), the Belgian people h been attracted in large numbers by the pros so pleasant to everyone of owning, no ma how small, his home.

CHAS. PETEIN,
Architect (Brussels

PROVIDENT INSTITUTION BUILDERS' FOREMEN AN CLERKS OF WORKS.

MR. WILLIAM WOODWARD, F.R.I.B.A., t the chair at the thirty-second annual di of this Institution on Saturday night, was supported by Sir H. Bartlett, B Messrs. A. W. S. Cross, F.R.I.B.A., H. No croft, A. H. Adamson, F. G. Minter, A. Rit B. Carter, etc.

The Chairman, in proposing the toast the Institution, said it was one which dese their sympathy and support. It was initi in 1842 for the purpose of granting pens to aged and infirm members, their widows children, and for making grants of tempo relief. The total amount paid in pens was over £20,000. Last year £755 was gra in pensions. Fifteen men received £546, ele women £174, and five children £33. In addi £30 was granted in temporary assista He was sorry to say that last year there w decrease in the income, and the directors not able to give pensions of so high a sum in past years, although, as they knew, cost of living was higher. The Institu was not carried on without strenuous work the part of the directors and officials. He had many interviews with the Secretary, Searchfield, and could say he deserved t warm thanks for all the trouble and tim had taken in bringing the dinner to the suc it was. Every architect would agree that builders' foreman could be, and frequently of the greatest possible assistance to architect, and when he himself started a the first thing he did was to ask the fore if he saw anything by which he thought job could be improved to let him know. had always got on well with the foreman, could say the same of the clerk of works. saw that Mr. James Brown, in an admi paper read before the Manchester Societ Architects, said: "The clerk of works without benefit to his clients' work, easily the builder to a large amount of very unn sary expense, but a real competent cler works is not only of value to the arch and his client, but also to the capable bu who is working under his supervision." believed all his architectural friends w agree with that. The present was a bad to ask for money, and so far as the architec profession was concerned he hoped it c not be in a worse condition than it was, seeing that architects were at a standstill a certain extent must be the builders. Government in its wisdom had put a sto building, and now they proposed to stop import of building materials. Architects tried to get a reduction in their income tax the Government would not listen to it. the less he hoped they would support su deserving institution, so that help migh given to those who fell by the way.

Mr. J. Beer responded for the Institution in urging its claims, said that there wa body of men more loyal to their empl than builders' foremen. They had a nu of cases now waiting to come on the pe fund, but they were determined not to t on their reserve fund, and if contribu did not come in they would have to dec the pensions still more, which in these would be deplorable.

H. Bartlett, Bart., who reminded his rs that it was twenty years ago that he led at the dinner, proposed “The tects and Surveyors.” He referred to plendid way in which so many had gone to fight for the country, and said that left behind had great difficulties to contend He heard that ladies were now hing on the architects' profession, and he red architects would show good feeling rds the movement. They had heard of ifficulties of architects and surveyors, but was one grain of comfort—the cost of ing was increasing, and they would receive nission on larger sums.

. A. W. S. Cross, in reply, said the archi- ral profession was indeed passing through lous times, but in military parlance they trying to “carry on.” He was afraid contributions from architects to the ution that night would be below the ge. He cordially agreed with the man as to the debt of gratitude architects to builders' foremen and clerks of works.

. H. Northcroft said he recently made a y of a mansion designed by the lady of place. She did not employ a quantity yor and was her own builder. He was l to say it was not so bad as it might have He would like to say one word as to andardisation of quantities and of methods easurement. They had recently published nphlet on the measurement of plasterers' , but the master builders seemed to find with it. Seeing how cordially they had orted him in his efforts to bring about ardisation he had hoped they would have this a good reception.

e Chairman, in giving the toast of “The ers and Contractors,” said that without detriment to the interests of his client rchitect could be a friend of the con- or, and it was to the interest of the architect e that the contractor got all that he was entitled to. He believed that was the g of most of the members of the profession ich he belonged.

. A. H. Adamson, in reply, said with regard e question of standardisation he had only tly been elected on the Council of the on Master Builders' Association, and did now much about the matter, but a con- or near him whispered, “Don't forget that ers were not consulted on the question e standardisation of quantities.” They passing through bad times, but they were g efficient. They heard a lot about my, but the keynote of economy was ency, and when they learned to do the work had to do efficiently they could snap their s at German competition.

. F. G. Minter proposed “The Governors, ees, Donors, Subscribers, and Visitors,” was acknowledged by Messrs. Alex. ie and Ben Carter. The health of the man was enthusiastically drunk on the sition of the Mayor of Hampstead.

OPOSED NEW BUILDINGS AND OTHER WORKS.*

these lists care is taken to ensure the racy of the information given, but it may ionally happen that, owing to building rs taking the responsibility of commencing before plans are finally approved by the authorities, “proposed” works, at the of publication, have been actually com- ed. LAW REPORTS.

Patent Scaffolding: £200 Damages: Important Decision.

In the Shoreditch County Court, on January 27, before his Honour Judge Graham, K.C., a case of importance to architects and builders, having to do with an accident alleged to be due to patent scaffolding, was decided by a jury. The plaintiff in the action was George Albert Brewer, a bricklayer, of 45, Allenmouth-road, Hackney Wick, and he sought to recover £300 damages from Messrs. Crossley & Sons, builders, of Bromley, Kent, for personal injuries, under the Employers' Liability Act, 1880.

The case had been before the Court before, and on the ground that the defendants were not negligent—which had to be proved under the Act—non-suited the plaintiff. The matter was taken to the Divisional Court, where the case was sent back for a new trial.

Mr. Moyses, barrister, appeared for the plaintiff, and Mr. Shakespeare was counsel for the defence.

In opening the case counsel said it was uncertain whether the injuries to the plaintiff would be lifelong or not. He could be awarded three years of his wages, and, on the basis of £2 12s. a week, that would be £405 12s. The accident occurred on May 14, 1915, so that he had already lost £96 in wages. To him it seemed that the negligence was conspicuous and glaring. The Act laid down that there must be some shown defect in the ways, works, or machinery, but not necessarily that it belonged to the defendant. If he as an employer borrowed a portion of the plant, and it let the workman down, then the employer was liable; or even if the plant was superintended by someone else. The work in question was being carried out at 239, Hackney-road, where a hundred-year-old building was being pulled down. Instead of the usual scaffold with poles being used, an innovation was employed—*i.e.*, a patent scaffolding. Nine-inch "grapplers" with teeth were forced into the brickwork, and brackets fastened on these with "feet" resting against the wall. Boards were rested on these, on which the workmen stood. If fifteen to twenty courses of bricks were above the "grappler," then things would be safe, but in this case there were only three courses. Plaintiff had been on the work for four days when he was sent up on this scaffold with another man. Besides them, on it were a number of pails of cement and baskets of bricks. Plaintiff had never seen such a scaffolding before in his life. After an hour the scaffold collapsed, and plaintiff fell 20 ft. across an iron bar in the area, being very badly injured; his mate was also very much hurt. The injuries to the plaintiff were such that an operation would no doubt put him right, but it would be impossible to get him into hospital under present circumstances. What was most important was that the House of Lords had held that a negligent way of using a sound system might make the employer liable.

After a great deal of evidence on minor technical points had been given, Judge Graham proceeded to sum up to the jury. He said counsel had pointed out the importance of this case, but really the point in it was extremely simple. The sole point was whether the defendants had been negligent. There was no question of the scaffold falling, which might have been badly fitted, or the wall bad. Who was responsible for it falling was the thing. Defendant would be negligent if he did not take proper precautions. What precautions did he take? Defendant said he employed competent people to put it up; it appeared to be so, but was it enough? Then a man came every second or third day to inspect this scaffold, and was that enough? They had to remember that the work was going on, the bricks coming off, and, if he might call it such, the danger zone was approaching. Was it watched sufficiently?

The jury retired, and after about ten minutes returned into Court and gave a verdict for the plaintiff for £200 damages.

Judgment was entered accordingly, with costs.

The London Building Act.

At Bow-street Police Court on Tuesday, February 1, before Mr. A. Antwiss Hopkins, the magistrate's decision in the case of Doll *v.* Perkins was given.

The Magistrate said:—Upon consideration, the point in this case strikes me as very short and the solution seems to be reasonably clear. The question arises upon an appeal by the architect to the builders, brought under sect. 150 of the London Building Act, 1894, against a notice of objection served upon him by the District Surveyor under the same section. The facts are entirely agreed, and are as follows:—The appellant is concerned in the conversion of nine houses in Upper Bedford-place into a residential hotel. The back additions to those houses abut upon Woburn-mews, and upon the top of the third floor of those back additions the appellant seeks to erect a miniature rifle-range. That erection will project beyond the statutory limits laid down in sect. 41 of the statute, and will be intersected by the well-known diagonal line, drawn under that section, from a point above to the centre of Woburn-mews. It is against that projection and intersection that the District Surveyor objects. The answer of the appellant is that sect. 41 is not applicable. The appellant contends (I am aware that I paraphrase his contentions, but I state the effect of them) that this domestic building has outgrown its size and character as a domestic building, and has become a public building, and that the provisions of sect. 41 apply to a domestic building, that once a building, which would be otherwise a domestic building, can be brought within the definition (if it be a definition) of "public building" in sect. 5, sub-sect. 27, all the District Surveyor's powers over it as a domestic building have ceased to be effective. Having regard to the construction, supply of light and air, protection against fire, and the kindred responsibilities thrown by the statute upon the District Surveyor, one would not so restrict his powers unless one were driven to it. It is contended that I am driven to it by the definitions and interpretations found in sect. 5, sub-sects. 25, 26, and 27. Without pretending that the sub-sections do not raise some difficulties, I think I may say that the appellant's contention can only be supported, as it seems to me, by the narrowest construction of the words. His contention deals with each clause as a rigid definition, outside which nothing of the same class could exist. I think the more natural and liberal meaning is that all three clauses deal with three classes which often plainly overlap. I dismiss the appeal and allow ten guineas costs. I will state a case if I am asked.

Mr. Hugh Beazley: I appear now on behalf of my learned friend, Mr. Rayner Goddard, who argued the case, who cannot, unfortunately, be here now, and I am asked to raise one point on the question of costs, and that is this——

Mr. Cowper: On that might I say this? It was arranged, I believe, that this should be a friendly contest between the parties, and that neither party should ask for costs.

The Magistrate: If you please.

NEW COMPANIES.

The undermentioned particulars of new companies recently registered are taken from the Daily Register compiled by Messrs. Jordan & Sons, Ltd., Company Registration Agents, Chancery-lane, W.C.:—

John & William Bellhouse, Ltd. (142,581). Hulme Hall-lane, Miles Platting, Manchester. Registered December 31. To carry on business as timber merchants, saw mill proprietors, packing-case manufacturers, joiners, cabinet makers, importers and exporters, and to acquire the business of timber merchants carried on by J. & W. Bellhouse, Manchester, dealers in builders' materials, engineers, brick and tile manufacturers, warehousemen, etc.

H T. Bishop, Ltd. (142,714). Registered January 14. To acquire, take over, and carry on business now carried on at 51, Rosebery-road, Brixton-hill, as H. T. Bishop, to carry on business of builders, contractors, decorators, merchants, and dealers in sand, lime, stone, bricks, timber, oils, varnishes, and other building requisites. Nominal capital, £1,000 in 500 £1 Preference shares and 500 £1 Ordinary shares.

Valves, Ltd. (142,710). Registered January 13. To carry on business of general engineers, machine makers, tool, pattern, and steam pump makers, manufacturers of pulleys, bearings, wire drawers, dealers in all kinds of metals, engine builders, and repairers, etc. Nominal capital, £1,000 in 1,000 £1 shares.

William Gimson & Sons, Ltd. (142,
Registered January 13. To acquire,
over, and carry on business of timber merch
builders, and contractors now carried on by
Gimson and T. Y. Gimson at Leiceste
William Gimson & Sons, coach builders, m
car body builders, french polishers, make
portable buildings, and all domestic wood
and joinery, mechanical, gas, water, elect
and general engineers, etc. Nominal ca
£22,000 in 22,000 £1 shares.

William Lock & Son, Ltd. (142,
Registered January 14. To acquire, take
and carry on business of plumbers, pain
decorators, and heating and lighting engin
now carried on by W. Lock & Son at 1
Norfolk-street, and Bath-yard, Broad-st
King's Lynn, as William Lock & Son,
carry on business of builders and contrac
gas, electric light, water engineers, deale
bricks, tiles, drains, and other pipes, t
cotta, etc. Nominal capital, £2,500 in
£1 shares.

Brown & Naylor, Ltd., Batley
Works, Bradford-road, Batley Carr, Y
Registered January 8. To acquire, take
and carry on business of brass founders,
finishers, now carried on by Walker Brown
William Naylor at above address, and to
on business of ironfounders, mechanical
neers, agricultural implements and
machinery and tool makers, builders, pain
electrical, water, and gas engineers, hard
of all kinds. Nominal capital, £2,000 in
£1 Ordinary shares.

Kearton, Bailey, & Co., Ltd. (142,
Deanos Inn House, 265, Strand.
Registered January 12. To carry on bus
of ironfounders, mechanical engineers,
manufacturers of agricultural implements
other machinery and tools, builders, pain
electrical, water supply, gas engineers,
dealers in hardware of all kinds. Non
capital, £1,000 in 1,000 £1 Ordinary shar

T. W. Leach, Ltd. (142,707), Clyde W
Avenue-road, Clapton, N.E. Regis
January 13. To acquire, take over, and
on business of builder and decorator carri
by G. R. B. Leach at above address as T
Leach, and deal in stone, sand, lime, ti
bricks, hardware, and other builders' requi
pipe, tile, and terra-cotta makers, ge
engineers, etc. Nominal capital, £1,0
1,000 £1 shares.

David Ashton & Co., Ltd. (142,647),
Works, Neepsend, Sheffield. Regis
January 7. To carry on, develop, and
to account the business of David Ashton &
formerly carried on by Carl Davenport
T. C. Goode as Messrs. David Ashton
at above address, and to carry on busin
ironfounders, mechanical, hydraulic, pneu
marine, and locomotive engineers, iron
steel convertors, builders, painters, the w
and winning of minerals, etc. No
capital, £20,000 in 5,000 £1 Preference
and 15,000 £1 Ordinary shares.

S. Bullock & Co. (London), Ltd. (142
39, Victoria-street, London, S.W. Regi
January 10. To carry on business of
mechanical, electrical, gas, hydraulic, he
ventilating, and general engineers, ma
turers of and dealers in machinery and
of all kinds, brass founders, smiths, bu
painters, and implements and hardwa
all kinds. Nominal capital, £12,000 in
£1 Preference shares and 8,000 £1 De
shares.

H. E. Jackson, Ltd. (142,778). Regi
January 20. To carry on business of en
ing, now carried on at Churchgate, Lei
as H. E. Jackson & Co., and to carry on b
of ironfounders, mechanical, electrical
supply and gas engineers, contractors, bu
painters, wood turners, printers, c
merchants, etc. Nominal capital, £2,
2,500 £1 Ordinary shares.

J. W. Cullen, Ltd. (142,763). Reg
January 19. To acquire, take over, an
on business at Leicester, as J. H. Le
carpenters, decorators, shop-fitters, b
and contractors, painters, merchants,
in sand, stone, lime, and other b
requisites, warehousemen, removers,
keepers, etc. Nominal capital, £6,000 i
£1 preferential shares and 5,000 £1 O
shares.

RICES CURRENT OF MATERIALS.

Owing to the exceptional circumstances which vail at the present time, prices of materials uld be confirmed by inquiry.]

ince our last issue sheet lead, oils, and turps have been uced, white and red lead increased, and several other ces altered.—ED.

Our aim in this list is to give, as far as possible, the *rage* prices of materials, not necessarily the highest owest. Quality and quantity obviously affect prices fact which should be remembered by those who ke use of this information.

List of Competitions, Contracts, etc.

For some contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, —; Contracts, iv., vi.; Public Appointments, xx.; Auction Sales, xxii. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

⁂ It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Contracts.

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

OL. CX.—No. 3811. FEBRUARY 18, 1916.

FIRE AND OPPORTUNITY.

THE burning of the Houses of Parliament at Ottawa, a calamity which has awakened profound sympathy throughout the world, leads naturally to the thought of other fires which have led to noteworthy architectural changes, most of which—to ·ank—have been to the advantage of the cities in which they taken place. It was the siege of Athens by the Persians, the destruction of her temples by fire, that made room the architectural glories of the age of Pericles; national ·ring followed by national achievement then, as usually , operated as a spur to national pride, as a stimulus to onal art, and to the fires of 480 B.C. may not unjustly be ibed the splendour of the Parthenon. We all know that ustus found Rome brick and left it marble—that is, that he aced the congeries of mean and often mud-built streets with stately buildings of an imperial city; it is less often rememd that the city which he thus created was practically wiped by the fire of 66, and that it was the much-maligned artistic us of Nero, with his strong Hellenic tastes, that laid out ie upon a new and nobler plan, which, owing to internal irbances and foreign wars, was finally only carried out by iitian over twenty years later. That Emperor indeed was to ie of the first century what Sixtus was to Rome of the later aissance; Domitian worked with Rabirius as Sixtus with iini, and many of the improvements of which Trajan finally the credit were due in fact to his less popular predecessor, himself carried out in many places the grandiose schemes ero. Most of the important buildings of imperial Rome ·h posterity flocks to visit date from the generations after fire of 66; if we think away the Colosseum, the Arches, the im of Trajan, the bulk of the buildings on the Palatine, all but the portico of the Pantheon, imperial Rome is nk indeed. Nor can we doubt that Rome, after the fire of ike London after that of 1666, was a healthier as well as a r city. The crowded quarters near the Tiber, the home of he myriad strangers who flocked to the city, and whose ence made Cicero term her *sentina gentium*, the cesspool ie nations, were swept away; purification by fire was, and io idle word in matters of health, and those who had no ne farms to escape to from the smoke and noise of daily life Rome found quarters better than they had had before. n the time of Augustus onwards building laws were strict; *lœ* or flats were limited to five stories, and the increasing ber of rich men's villas within and about the city minimised amount of waste ground which had been used before for al or the casting-out of bodies of slaves and other nitary or inhuman purposes.

Rome was to endure many sieges, many conquests on the part ie barbarians, but even Alaric spared her the worst horrors re; and, in spite of being five times sacked by the ibards, the city suffered less than might have been expected, igh Gregory the Great wrote to the imperial Government onstantinople, "For twenty-seven years we lived in terror he Lombards, nor can I say what sums we had to pay i." Much more terrific, because more modern and carried by a more civilised people, was the sack of 1527, but the ie we think of, apart from classical antiquities, the Rome he fountains and domed churches, of palaces and colones, is in great measure due not to disaster by fire or sack, to the creative instincts and high artistic feeling of a ession of pontiffs who were able enough to appreciate genius of their architects and decorative craftsmen and ligent enough to give them a free hand.

So, too, the Fire of London—that calamity which we speak ithout prefix as "the Fire"—with all that it did, was good in the disguise of evil. Like the Rome of Domitian, the London of Charles II. was fortunate in possessing an architect of supreme genius, to whom the chief features of the remodelled city were entrusted for a generation. Old London—the London of before the Fire—we can reconstruct from prints and drawings of itself and from parallels elsewhere, Chester and Ludlow, Oxford and the Newcastle of two generations ago; the city as we know it is due to Wren, from the soaring dome which to most of us is London to the little church of St. Benet, from Bow to the church of St. Magnus close by the river. The city inhabited since Roman days disappeared as if by magic, and on its ruins arose the City as we know it, shorn, alas, of many of Wren's churches, but still dominated by his genius!

The two supremely important lay buildings left untouched by the Fire were both, strangely enough, doomed to perish in later conflagrations—the picturesque buildings of old Whitehall, Inigo Jones's Banqueting House excepted, in the Great Fire of 1697, which swept away so much of historic and artistic importance, and the Houses of Parliament, the glow of whose destruction was recorded by Turner in a painting of his greatest period. Both of these fires were due to carelessness, and both did much irreparable damage; but we can at least console ourselves with the thought that Wolsey's other palace, Hampton Court, was a finer specimen of its age's architecture than ever was old Whitehall, and that the present Houses of Parliament, criticise them in detail as one may, are in the aggregate a noble pile, worthy of an imperial city. The loss of the Banqueting House or of Westminster Hall would have been a greater one for posterity than that of the larger and more rambling piles of buildings that made up old Whitehall and the earlier Houses of Parliament; it was better to lose some of the artistic treasures of Charles I. at Whitehall and the House of Commons whose rights he invaded than the building on whose floor he stood for his mock trial, or the fatal window of that Banqueting House which his father had built and he had finished, and, as many generations held, had consecrated with his blood.

The destruction of Moscow in 1812, commonly held to have been self-inflicted, which marked the turning-point of Napoleon's fortunes, was by no means that city's first experience of fire. At least four conflagrations occurred during the eighteenth century, in spite of Peter the Great's order that only stone houses should be built within the walls of the town an order founded on the ghastly experiences of the sixteenth century, when the Tatars burnt the city, leaving, it is said, only 30,000 inhabitants alive out of 200,000. The new Moscow that arose after the Napoleonic wars has, as a Russian city, that rare quality of the picturesque which is usually lost when a new town is built on the site of the old, and not even trams and railways can injure the impression that she makes on every traveller. We can only hope that other cities of Europe destroyed by the modern invader may be as happy in their reconstructors.

Rome has been fortunate in her rulers and architects; Greece in those who rebuilt her temples; England was supremely fortunate in having at call in her hour of need the greatest architectural genius whom she has yet produced; her Houses of Parliament were replaced by statelier if a less interesting successor; and while we sympathise with Canada in the calamity, perhaps the outrage, which she has undergone, let us hope that she, too, may find her Wren or her Rabirius ready to add his genius to what she has herself to offer, one of the noblest sites, one of the greatest opportunities, to be found in all the world. If this be so, we may again see creative art rising Phœnix-like from the ashes of destruction.

NOTES.

Carpenters' Hall Lectures. A VERY interesting lecture was given on Wednesday last week at Carpenters' Hall on the Sculptures of Reims Cathedral by Mr. Arthur Gardner, which was illustrated by some exquisite lantern slides. The lecturer expressed his conviction that in destroying the wonderful thirteenth-century sculptures of the west front the Germans had done what would prove more disastrous to themselves than to the people the records of whose ancient tradition they had partially obliterated, and he hoped that in any future restoration of the building care would be taken to preserve the sculptures as they were. We agree with this view unless casts are in existence which would enable the restoration of sculpture to be practically so complete and accurate that, to future generations, it would convey the impressions and feelings that we who know the originals have felt. There are sculptors whose knowledge and skill are so great, and whose sympathies are so keen, that, given good casts, they might be able to produce work which would be almost identical with that of the French imagers. But however that may be, we may feel sure that the French, with their sure artistic insight, will not, when touching the sacred stones of Reims, do anything which the world will regret, for we have long passed the days when the mistakes made in the time of the Gothic revival are possible.

The Right of Criticism. WE learn from a contemporary of an interesting decision bearing on the right of criticism in the public Press. Comments were made in a Dundee paper on a discussion which took place on the cost of an extension to a school, which the Chairman stated had cost about double the official architect's estimate, and proposed that his agreement should be revised. The local paper stated that under the present system it was understood that the Board's architect should carry out small works, while larger ones should be put out to competition, and added:—"The rule, as interpreted, is an absurdity, and puts a premium upon a certain kind of advice." The architect brought an action against the journal, arguing that the article accused him of being unfaithful to his trust and acting corruptly for his personal benefit. The first Scottish Court dismissed the action, the Court of Appeal upheld it, and the House of Lords agreed with the first court, Lord Haldane saying:—"Any person in the position of architect to a school board must submit to a large amount of public criticism—such criticism would not be permissible in the case of a private person. In such cases malice at law was rebutted and malice in fact must be proved." Personally, we think all depends on facts, but if these are not proved up to the hilt those who make such statements should be most severely penalised. With the ex-Chancellor's statement—"It is important that the Press should be at liberty to criticise fairly public men"—we are in complete agreement, though we may say that recent events leave us in considerable doubt as to the ability of public men to take in good part criticism which certainly contains little that is personal and is dictated by the desire to obtain efficiency without regard to persons.

Courts Emergency Powers Act. WE may draw our readers' attention to an important decision of the Court of Appeal, delivered January 1, under the Courts Emergency Powers Act, 1914, in the case of Ness *v.* O'Neil. The plaintiff was the lessor of certain premises under an agreement which made the rent payable monthly, and which gave a right of re-entry if the rent remained unpaid for ten days after it was due. The rent was left unpaid for a longer period than ten days after it was due, and the plaintiff issued a writ to recover possession. Sect. 1 (1) (*b*) of the Act provides that no person after the passing of the Act shall "levy any distress, take, resume, or enter into possession of any property, exercise any right of re-entry, foreclose . . ." except after application to the Court. The writ had been obtained without leave of the Court and the defendant contended that the Act applied. The Court of Appeal have held, following a case, *in re* Farnol Eades, Irvine, & Co., where debenture-holders were applying for the appointment of a receiver, that the section applies to proceedings of a summary nature, and, notwithstanding the inclusion of the word "foreclosure," does not apply to proceedings in the nature of foreclosure by action. This decision is of importance to landlords, but it must be noted that, although an action can be instituted without leave, yet the judgment cannot be enforced by a writ of possession until leave is obtained.

Criticism or Abuse? THOSE who are employed in any capacity in connection with the decorative scheme of Westminster Cathedral have much to contend with, because, in the nature of things, their task is a most difficult one in the present age. The number of architects who can design a building of outstanding architectural merit are few; the number of those who can direct the work of a body of craftsmen in the design and execution of a decorative colour scheme—controlling, guiding, and at the same time never cramping them—is fewer still. If, i circumstances, the result is not all that extravagant fancy or ide would have it, we may yet have what gives us lasting pleasur is a credit to the æsthetic talent of the age. But the greater pa the letters which have appeared in the columns of the *Observ* the Stations of the Cross and the decorations of the chapels n with reason have been consigned to the wastepaper-basket as for the most part both ignorant and offensive. Most of the w hide their anonymity behind combinations of letters and pseudo and would hesitate to repeat their views above their signatures. suppose the reason we are not favoured with these effusions is the writers presume that in an architectural journal they woul judged and found wanting, however picturesquely they compar decoration of Westminster Cathedral with that of a bathroo underground convenience. If some of the critics will send us o their wisdom and knowledge alternative suggestions, showing should be done, we shall be glad to illustrate them for the gr guidance of artists and of posterity!

Economy in Railway Travelling. AS, both during the war and for some time aft is ended, every class will be called upon exercise strict economy, it seems a suitable tim raise the question whether the railway compa may not be wise to revise their policy of abolis the second class and retaining the first class, and whether, in altered circumstances created by the war, a more advantag system, both for the companies as well as for the general pu would not be to abolish the first class and retain the second c except possibly in the suburban districts where the interests of sea ticket holders are concerned. Even before the war broke out first-class compartments were, on long-distance trains, comparati empty, and represented unremunerative dead weight to the compan but in the altered condition of economic affairs still fewer per will be in a position to afford or feel justified in spending double necessary amount for performing a journey, yet to many— especially to ladies—the increased comfort and diminished crow to be secured at a small extra cost, as is the case in the second c is a very great convenience.

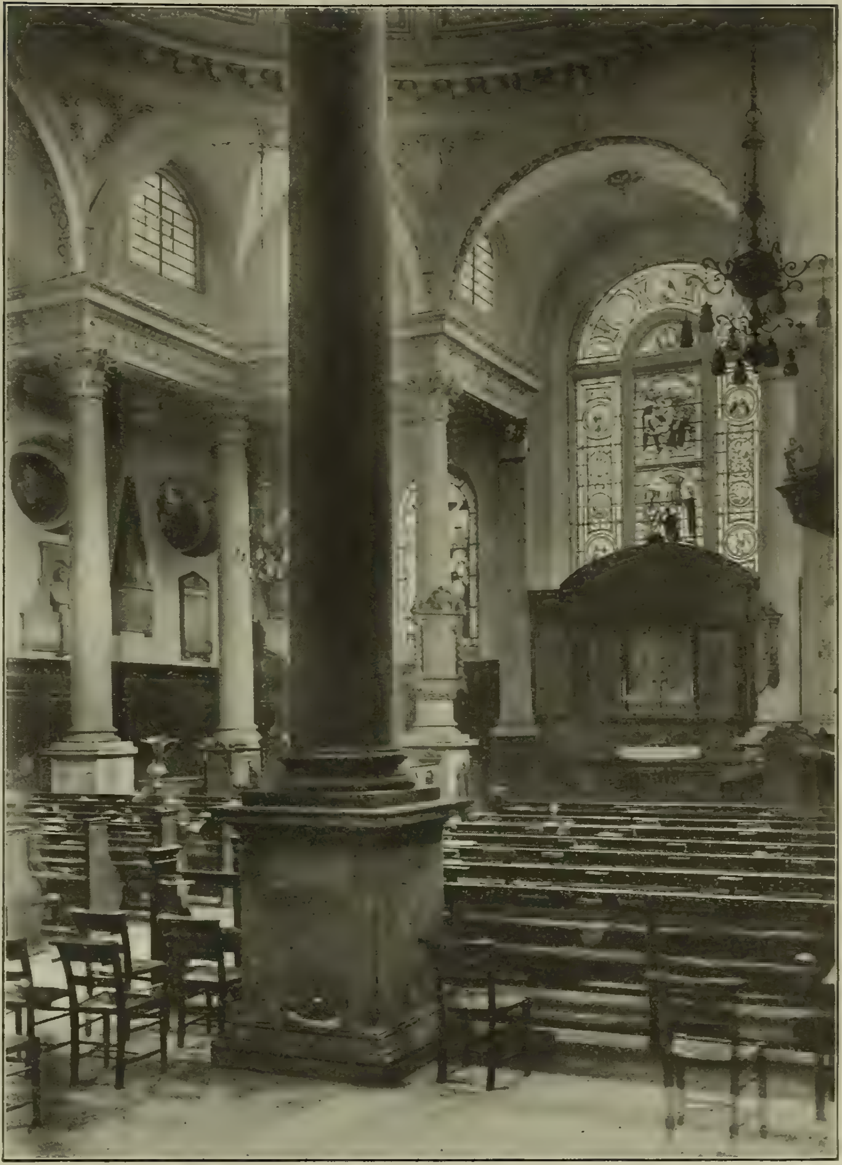
Doncaster Town Planning. THE development of Doncaster has been chec by the war, but, as the housing problem is very ac the Doncaster Rural District Council have de mined to go on with their town-planning sche in order to control effectively the character and growth of the mining villages. A good beginning has been made, and the L Government Board have been asked to sanction the formation of a t area. A great problem is caused by the low altitude of the gro where at times large areas are actually under water. Very l of the land to the north and east of Doncaster is more than 2 above the sea level, and as the fall of the Don and the main dr which enter it are very slight, the provision of adequate drai is unusually difficult. In the Askern area already planned ou 5,170 acres 2,436 are less than 20 ft. above the sea level. Regulat have been drafted and are receiving the consideration of the L Government Board, with the object of preventing the use of low lands for the erection of dwellings, though it may be uti for industrial buildings, and one of the important provisions of scheme gives the authorities power to differentiate on this p One pleasing feature of the development so far has been the gratif response of the colliery providing housing accommodation. T have willingly co-operated with the authorities. Their gene interpretation of their responsibilities is exhibited in the fa model colliery village at Woodlands; in the village at Park between Carcroft and Owston Park, in connection with the Bul Colliery, and in the progressive character of the admirable vill at Edlington, Askern, and Rossington. These form an exa for future efforts in the same direction. In the meantime the taken by the local authority under the powers of the Town Plan Act, 1909, may render the development of the South Yorkshire field not only unparalleled in industrial expansion, but also in preservation of the amenities of the district, which have bee ruthlessly sacrificed in the case of the development of the Du coalfields.

Honours to Architects. WE are very glad to record the fact that an those members of the architectural profession have done distinguished service in the war is Ca H. P. G. Maule, of the Honourable Artillery Comp who has been awarded the Military Cross. Captain Maule distingui himself in his professional career both as the designer of admirable domestic work and as an untiring enthusiast in the of architectural education, and, as past Headmaster of the Arch tural Association Schools, is responsible for much of the succe that very virile and useful body. It is also pleasant to hear Lieutenant Maurice E. Webb, who left his professional work to the forces, has been mentioned in Sir Ian Hamilton's despat December 11, 1915.

HE LONDON CHURCHES OF WREN AND LATER ARCHITECTS OF THE RENAISSANCE.

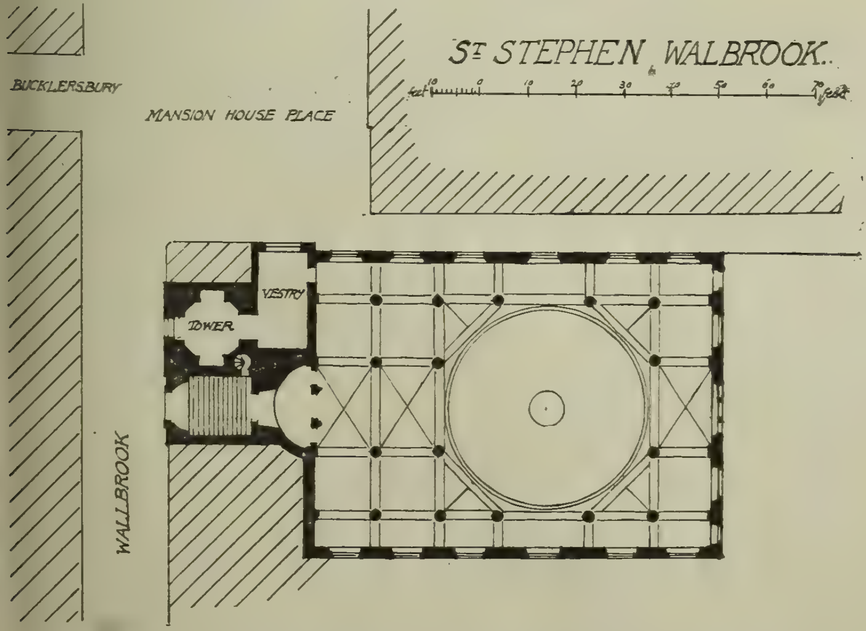
No. XIII.—St. Stephen, Walbrook.

VALBROOK preserves the name of a stream ich, rising in the swamps beyond Moorgate, ved into the Thames at Dowgate, and on banks was built a church dedicated to St. phen, which dates as far back as Henry I., l was rebuilt in the reign of Henry VI. ough the instrumentality of Sir Robert cheley, who had been twice Lord Mayor. e church was repaired in the reign of Charles I., t was totally destroyed in the Great Fire. er the Fire the neighbouring church of Benet Sherehog in Pancras-lane was not uilt, and its parish was united with that St. Stephen. The present church, which s one of the earliest to be rebuilt after the e, was completed in 1679 at a cost of £7,652, l it is singular, in view of the fact that many the sites of Wren's churches are similar in a and shape, that he never attempted another ign showing the same grasp of the effects be obtained by masterly planning, for in design of St. Stephen all the problems be solved in a Renaissance church meet an equate and fitting solution. The square ce formed by the ranges of columns under dome provides the congregational space uired; the groined plaster vault of the tre compartment of the nave and the responding shorter transverse vault across ress the cruciform idea; the church is ingly marked, while the columned spaces ich fill up the angles give a variety of spective effects and a sense of space which vanting in other churches of equal dimensions. It is difficult to realise that the area covered smaller than that of Bow Church; it is a ious subject for speculation that, having ught out this dream of architectural form, ren could have been content to build ch churches as Christ Church, Newgate, St. Andrew's, Holborn, unless it is that the luence which prevented the execution of first design for St. Paul's were active in posing the design of smaller buildings in ich mediæval tradition was ignored. On other hand, Wren may have been dissatisfied th the external forms by which a church of type could be expressed, or may, like many dern architects, have disliked repeating idea or working on the same type. Be this it may, St. Stephen, Walbrook, will be to time an instance of the supreme expression poetry in architecture—a proof that in the nds of a master combinations of form in

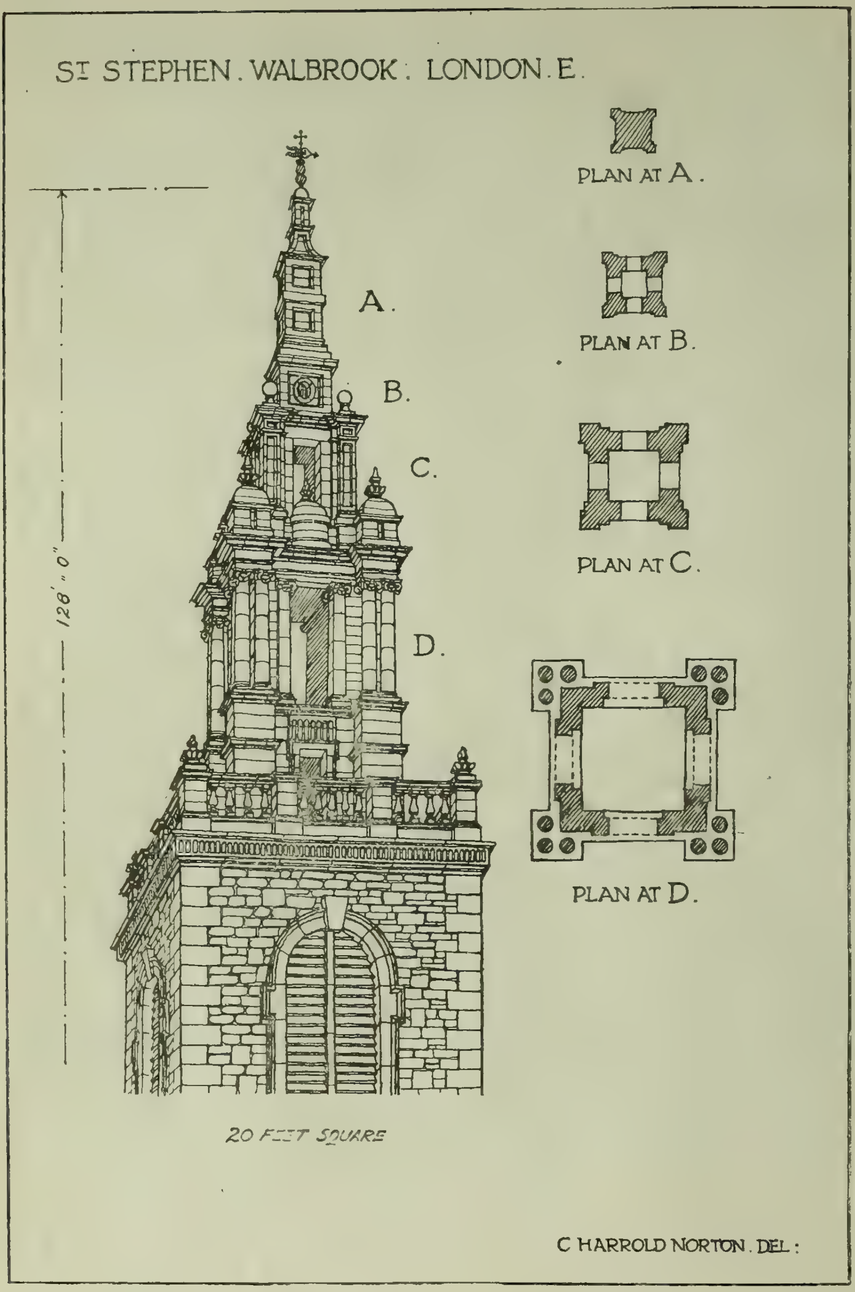


Wren's Churches: St. Stephen, Walbrook.

Renaissance architecture can be made as expressive as the earlier combinations of mediæval and primitive styles, and that the thought conveyed in any style is infinitely more important than the medium through which it is expressed. The effect of the interior depends on the skill with which square, octagon, and dome merge into one another in the design of the centre feature and in the skilful disposition of the remaining columns, which, with a minimum interference to the seating accommodation, produce a maximum perspective effect. The pulpit and the woodwork are good, and, though the church suffered a certain loss in character in 1888, when the high pews were removed by Penrose, the interior has gained in apparent spaciousness. There are many good monuments in the church, the oldest of which, on the column to the south side, is in memory of William Lilbourne, who died in 1678; opposite to which is a very pleasing Baroque monument to Robert Marriot, a rector who died in 1689. Another fine monument is that to Percival Gilbourne, an apothecary, who died in 1694, which takes the form of a bust with architectural accessories. A very pleasing monument is that to G. Griffin Storestreet, a managing director of the Phœnix Assurance Society, who died in 1802. Externally the only noticeable feature is the steeple, which rises above the adjoining buildings and can be well seen from Mansion House-place. The repeated emphasis given by the successive square stages recalls a similar note which



(Reproduced from the Ordnance Survey Plan, with the sanction of the Controller of H.M. Stationery Office.)



distinguishes Spanish Renaissance towers, though the suggestion must be purely accidental; but the design is singularly happy, possessing unusual character and dignity.

No. XIV.—St. Bride.

The Church of St. Bride is usually coupled with that of St. Mary-le-Bow, since the two steeples are the most important architectural features of Wren's London churches; but St. Bride has the disadvantage of being closely surrounded by other buildings, which renders it impossible to study it to full advantage. The date of the erection of the first church is unknown, but mention is made of it in 1222. The living is in the gift of the Dean and Chapter of Westminster.

After the Great Fire the present church was built in 1680, the steeple not being completed till 1701. The total cost of the church was nearly £12,000. In 1764 the steeple was badly damaged by lightning, and 85 ft. of its height was taken down and rebuilt by Sir William Staines, who reduced the total height by 8 ft., leaving it 226 ft. in height instead of 234 ft. as originally designed.

The design of the diminishing stages of the steeple is beautiful if somewhat prosaic compared with the greater variety and complexity of that of St. Mary-le-Bow; its detail, and that of the church generally, suggests a somewhat freer rendering of the Renaissance than that adopted in St. Mary-le-Bow. Internally, this freedom is expressed in the piers of the nave arcade, formed of two columns which intersect one another, forming an elliptical pier set at right angles to the axis of nave, with a pilaster placed at their intersection, which carries the gallery front. These and other details suggest a Renaissance rendering of fundamental principles of Gothic design, which give a somewhat coarse and crude appearance, detracting from the bold and dignified conception of the interior, an effect which is emphasised by the unpleasing decorative scheme. It may be said that the beauty of St. Bride, like that of St. Mary-le-Bow, is mainly external, and that in spite of its dimensions it cannot be considered to hold a high place among the interiors designed by Wren.

Although the church has galleries they are not expressed externally, but are carried across the centre of the windows, which do not mark the internal divisions. The most pleasing details internally are the entrance door cases of the vestibule on either side, but the woodwork generally fails in refinement and interest, and is mechanical in effect. The most noteworthy monuments in the church are those erected to Jasper Nedham (1679), and Carey Stafford, a Whitefriars glass manufacturer (1760), and one to Isaac Romilly (1759), all of which are placed in the broad entrance vestibul The best near view of the steeple is tha obtained from Salisbury-square, nearly on th diagonal of tower, emphasising its some what monotonous effect, as can be seen by th excellent photograph which we give on page 14 taken by Mr. George Trotman.

* * *

CORRESPONDENCE.

The Erection of Munition Works.

SIR,—I understand from your columns tha the Government have not given the architec of the country that consideration due to the by utilising their services where they could ha been most valuable. Some weeks of invest gation on the erection of munition works ha been placed before the Ministry of Munition demonstrating that there had been much wast which might have been avoided, as well delay, which would have been impossib under the supervision of properly-qualified me I have proof of the absolute waste of hundre of thousands of pounds in the erection of o munition works alone, and this a comparative small one to those now going on in differe parts of the country, reports from which I a now receiving. Cannot the Institute take t matter up and bring weight to bear upon t authorities, as the wastage must amount thousands daily? ASSOCIATE.

Should Art be Artless?

SIR,—In the current number of the R.I.B. *Journal* there appears a review by Mr. Franc Bond of Sir T. G. Jackson's "Goth Architecture in France, England, and Italy.

Mr. Bond, in the course of an appreciati analysis, quotes from his author the followin passage:—

"The men of the Middle Ages did thing beautifully because they did them unco sciously . . . they had the inestimab advantage of having no choice; they knew other style but their own. . . . So lon as our work is consciously imitated from wh was done in other days and other condition so long will it remain unreal."

Mr. Bond describes this as an admirab pronouncement and further comments upo it thus:—

"Each architect knew nothing and car for nothing but the work of his own day, an this narrow-mindedness was his artist salvation. We moderns know too much."

It would seem that both Sir Thomas Jacks and his sympathetic reviewer have err grievously against their own convictions adding further to the prodigious mass antiquarian lore, for, on their own showin the purchase of their works is likely contribute to our artistic damnation.

In view of the dicta of these two gentleme it is amusing and disconcerting to take u the R.I.B.A. *Kalendar* and turn to the recon mendations of the Board of Architectur Education, the "Advice to Candidates," an the imposing "List of Books Recommende to Students."

Some of our hard-working architectur aspirants will be pleased to learn from tw such authorities that in "narrow-mindedness lies their "artistic salvation," and that they ma with a good conscience emulate the men of t Middle Ages and "know no other style b their own."

Is our whole scheme of architectural researc and education a waste of time and money?

J. ALEXANDER PIRIE.

Wren's Churches.

SIR,—Mr. Lindley Latham's suggestions th models of these notable old churches should made for permanent public exhibition w no doubt meet with general approbation, a I would advise any of your readers who ta an interest in London's ancient buildings go and view the charming models of "O London Bridge," "The Tower," etc., no permanently on exhibition at the Lond Museum, Stafford House, S.W., made by M John B. Thorp, and they should also see t realistic models he has just completed of t city's ancient gates, as they are exactly t kind of models suggested by Mr. Latham.

Mr. Thorp being an old friend and former pil, I take deep interest in his beautiful rk, and I should like to see an illustration these gates in your journal, as I am sure ey will give pleasure to many architects who too far off to visit London.

FREDK. NESBITT KEMP.

SIR,—I quite agree with Mr. Latham's ter of last issue as to collecting all the information comprised in plans, models, and architural literature of every building erected by ren. I thought of suggesting to make a ginning with this valuable collection and cing it in or near the library of St. Paul's if commodation could be obtained in this nerable edifice. All lovers of art treasure, m sure, will give Mr. Latham's proposal their st support.

JOHN W. GRANT,
A.M.C.Inst.(Lond.).

---

cond-Lieut. C. Howard Jones. A.R.I.B.A.: The Military Cross for an Architect.

SIR,—The award of the Military Cross Second-Lieut. C. Howard Jones, A.R.I.B.A., l probably interest the architectural d building professions. Mr. Howard nes, who joined the Public Schools' ttalion at Epsom immediately after the outeak of war, was up to that time on the hitectural staff of H.M. Office of Works, rey's-gate, Westminster, where he had been gaged since serving his articles with Mr. r Jones, A.R.I.B.A. (Ivor Jones and Percy omas), Cardiff.

He has been responsible on two occasions exceedingly useful work. As Brigade out Officer he has discharged difficult obsertion duties in the front trenches and has bmitted reports and sketches of great portance. On another occasion, in company h a fellow-officer and two men, he figured an exacting wire-cutting episode between British and German trenches in the neighurhood of Loos.

From the Public Schools' Battalion Mr. ward Jones was appointed as Second- eut. to the 3rd Welsh, and after being ined with them at Cardiff and Porthcawl s drafted out to France attached to the d Welsh, and was present at the German nter-attack after the battle of Loos.

IVOR P. JONES.

Pre-War Contracts and the Government.

Ve have received the following open letter this subject, which is of particular public erest :—

e President, the National Federation of
Building Trades Employers.

SIR,—I have read with considerable interest account of the meeting of the National deration of Building Trades, and particularly speeches and resolutions on the subject pre-war contracts.

rejoice to see by the final resolution that National Federation is to move, and I trust ckly, by approaching the Government upon s very urgent and serious question.

A very large number of people, not only nected with the building trade, but in sorts of trades and businesses, are being iously worried by the position in which y are placed. As the present law stands y have to bear the whole burden (however ssly unjust) of their inability, attributable ly to the war and to no other cause, to il contracts entered into previous to the (in a very large number of cases only a weeks previously), while the other parties he contract can exact the uttermost farthing, the utter ruin of a large number of their tims, while they remain comfortable, because remedy is given by the Common Law, as it been interpreted by eminent judges in the t, who had never in contemplation such a as we are now engaged in.

The condition of affairs created by this alling calamity of our "State being at " has therefore no real effective recognition he courts.

notice several of the speakers jumped ahead the main object, which should be kept in forefront of any action taken by the ional Federation and allied associations, viz., to press the Government to pass a short Bill giving power to the courts to consider the effect of the state of war upon any case of pre-war contracts brought before it, and to have power to give relief and to do justice as between the parties, as the merits and details of each may in the discretion of the court require. If this Act is passed there is no doubt whatever that rather than face the ordeal of an exposure in the law courts the oppressive party in a contract would be willing to come to reasonable terms, whereas under the present position (where a contractor or lessee is suffering under an oppressive pre-war contract) he is like Dean Swift's "Man in his Shirt" against an unreasonable and greedy opponent armed to the teeth, with no remedy.

The Government are making appeals that every one is to do their utmost to assist the country and release "men, material, and money" for the country's assistance in the prosecution of the war, and I know of very many cases where people are prevented from doing all they might in this direction because of the serious position in which they are placed on account of these pre-war contracts and the responsibilities in connection therewith, tying them down to these affairs. There is no doubt that the Government from the very start have neglected a most urgent duty which should have been one of their first acts (as was done in France and Germany) immediately on outbreak of war, viz., to free their citizens from the consequence of pre-war contracts that were made impossible of fulfilment by the war, so that their countries might have the full benefit of all the energies of their peoples. Our Government has so far shelved this and other questions, with the results that we now find, having to approach and plead with the Government to do its duty, by knocking at its door, and repeatedly knocking, before it will act and permit justice to be done.

The question is therefore not one of asking the Government to make good losses, but it is a question of giving the right of entry to a court that shall have power to deal with any and every case brought before it upon its merits.

I trust that the National Federation will act quickly in this matter and press it (on these lines) upon the attention of the Government.

There are numerous cases that can be quoted all over the country of the oppressive state of affairs, not by any fault of the lessees or contractors, but solely on account of the war, and especially as proceeding with these contracts in most cases means competing with the Army and Government for "men, material, and money." Justice and the interests of the country call for immediate remedy.

Painters' Rates of Wages.

SIR,—Will you kindly allow me space in your journal to reply to the letter of Mr. Depree, Secretary of the London Master Builders' Association, as contained in your issue of February 11? Your correspondent makes statements which are somewhat misleading.

The London Association of Master Decorators and the Society of Operative House Painters and Decorators, having agreed on the question of wages, referred certain working rules to the arbitrator, on the basis of such wage increase.

On the day appointed the President and Secretary of the Builders' Association, Mr. W. Lawrence and Mr. Depree, attended, and asked to be allowed to state the case for the builders, and consequently to be present during the proceedings. After consulting with the Master Painters and Operatives, the arbitrator agreed to allow them to remain, provided they gave an undertaking that their Association agreed on the rate of wages. This they would not do, and consequently the matter was proceeded with after they retired.

The arbitrator, in giving his award, embraced the rates of wages, a copy of which I enclose.

Mr. Depree says that the reference to the builders as contained in my previous letter should be ignored. Well, that appears to be the case of the Association of Builders, and were it not for the fact that members of Mr. Depree's Association are in the favoured position of employing painters at ½d. and 1d. per hour less wages than the firms they compete against, and thereby ignoring the only existing agreement between workmen and employers in the painting and decorating trade in London, less notice might be taken; but in face of the unfair competition put up, such argument lacks substance.

On very numerous occasions firms outside either Association of employers quote your journal when we have occasion to approach them on the question of wages, and refer to the rates tabulated therein. And in conclusion I again submit that the rate you quote can with all fairness be so altered as not to act detrimentally to the workmen; and it is because I think you desire to be fair to the whole of your contributors that I refer to the matter.

JOHN BANCROFT,
London Organiser, Society of Operative House and Ship Painters and Decorators.

LAW REPORT.

Elliott *v.* Biggs.

ON Monday at the Westminster County Court his Honour Judge Woodfall gave his decision in this case, which had been remitted back to the County Court by Mr. Justice Coleridge and Mr. Justice Low from the High Court.

Mr. G. A. Scott and Mr. B. B. Stenham (instructed by Messrs. Rutland & Craufurd) appeared for the plaintiff; Dr. C. Herbert Smith representing the defendant.

The case, which has been reported in previous issues of the *Builder*, was an action brought against the executrix of the late Mr. T. Woodbridge Biggs, architect, for alleged professional negligence in connection with the erection of a greenhouse at Chalk Pit, near Maidenhead. At the time there was no complaint, but subsequently an action was brought by Mr. Biggs for his fees as architect on another contract. Later on Mr. Elliott complained of alleged improper supervision by the late Mr. Biggs, and said he had been put to extra expense. When the case was before the County Court the judge non-suited the plaintiff on the ground that the Court of Appeal had held that wherever an architect issued a certificate he was acting in a judicial or quasi-judicial character, and that no action could lie against him for negligence. The only ground for action in such a case was allegation of fraud, and no such allegation was made here.

When the case was argued before the High Court it was contended on behalf of the plaintiff that the County Court Judge had discretion to deal with the matter on the amended particulars, and that therefore he was wrong in non-suiting the plaintiff. Mr. Justice Coleridge, with the assent of Mr. Justice Low, sent the case back to the County Court on the ground that it was within the judge's discretion to allow or disallow amended particulars.

Mr. Scott, in asking the judge to rehear the case, contended that the amended particulars disclosed a good cause of action. He quoted the cases of Rogers *v.* James and Armstrong *v.* Jones in support of his contention.

Judge Woodfall remarked that the order which sent the case back to him was certainly very peculiar. As regarded his own decision when the case was last before him, he was very clear, and it seemed to him that the High Court order did not deal with his decision at all. He saw no reason to depar from his ruling that a plaintiff could no enlarge his cause of action in further par ticulars; all he could do was to amend hi cause.

Mr. Scott said that his point before th High Court was that his Honour took to narrow a view of the position, and that h should have looked at both sets of particular in deciding whether or not there was a caus of action.

The Judge said it seemed to him that th only point he had to consider was whether, i his opinion, the further particulars disclosed cause of action.

Dr. Smith agreed that that was so, an submitted that no further particulars coul disclose a cause of action unless the cause wa shown in the first instance.

The Judge, in giving his decision, said th the issue of the certificate clearly gave no cau of action. The case was full of difficulty b reason of the way in which the order remittin it back to him was framed. But whatever th order was, he was, of course, bound by i According to his reading of the order he ha to determine whether the further particula disclosed a fresh cause of action. In construin that they had to consider what was the cau of action alleged, and it was that the archite had been negligent in giving his certificat In his view, that allegation gave the plainti no cause of action. Of course, the plainti might amend his claim, but he had not do so; all he had done was to give furth particulars. He must construe those furth particulars by having regard to the fir particulars, which, in his opinion, did not gi a good cause for action. The plaintiff had n disclosed a fresh cause for action, and therefo the application must be dismissed.

ENERAL NEWS.

Professional Announcement.

. Colbourne Little, F.R.I.B.A., of Hong- . has amalgamated his business with that ssrs. Thomas, Adams, & Wood, of Canton. will in future practise under the style or of Messrs. Little, Adams, & Wood, with s in Hong-Kong and Canton.

Folkestone-Dover Road.

e direct route between Dover and stone by the road near the top of the cliffs w open, the Kent County Council having ed the construction of a new piece of at Capel to replace that rendered unsafe nsequence of the effects of the landslide lkestone Warren on December 19.

Institution of Civil Engineers.

an ordinary meeting of this Institution, on the 8th inst., the following elections of bers. Associate Members, Transfer of iate Members to Members, and admission udents were reported :—Elected Members, lected Associate Members, 21 ; Transferred Associate Members to Members, 25; tted as Students, 9.

Sale of City Freeholds.

e freehold and leasehold premises, Nos. 0, and 92, Cannon-street, 16, 17, 18, and aurence Pountney-hill, 1, Suffolk-lane, and 2, and 33, Bush-lane, close to Cannon- t Station, covering a ground area of nearly 0 sq. ft., and having a rent roll of over 0 a year, have been sold by Messrs. nham, Tewson, & Chinnocks, Sir Howard k (Messrs. Knight, Frank, & Rutley) acting he purchaser.

Government Architect, Burma.

e learn that Mr. T. O. Foster, F.R.I.B.A., has been appointed Consulting Architect e Government of Burma in succession to ate Mr. Seton Morris, has taken over his s from Mr. E. J. Pullar, who has been ating. The new Consulting Architect d the Government of India nearly three ago at Simla, where he has since been at on different works and on the new Delhi. ious to that he was practising at West- ter for seven years.

Germany at Work.

. Joseph Pennell was at the outbreak of in Germany, having gone there some hs previously to arrange the Anglo- rican Section of the Leipsig Exhibition of and Crafts. During his stay he was given ties for carrying out a large number of ings of German dockyards, steel-works, es, and coal mines. The result of his work g the summer of 1914 will form the subject exhibition to be opened at the end of this h at the Leicester Galleries.

Recent Discoveries in Crete.

e Principal of King's College, Dr. R. M. ows, delivered a lecture at University ge on "Recent Discoveries in Crete." Burrows said the war had practically put p to excavations in Crete during the last years, and he went on to deal with the veries made within the last four or five s in the Palace of Cnossos, chiefly under direction of Sir Arthur Evans and the sh School at Athens. The restorations in the stairways of the Palace had been successful, but he could hardly say that t the way in which the frescoes had been red. The crystalline slabs were very and had been covered with plaster to ct them from the Cretan storms. In the t excavations the plaster had had to be off. It had generally been taken for ted that Cnossos was unfortified, but a French writer had challenged that and the latest discoveries seemed to that it had some fortifications—at all ts in middle Minoan times—and that it became unfortified. Dr. Burrows ed how the whole place was drained, the m being borrowed from Egypt. But in pipes that had been discovered were drain pipes, as used to be thought, but s for the supply of fresh water.

Gift of Plaquettes to the British Museum.

We understand that Mr. T. Whitcombe Greene has presented his collection of Italian and German plaquettes to the British Museum.

Burne-Jones's House.

The house in which Burne-Jones was born at Bennett's Hill, Birmingham, was found to be on fire on Friday last week. Although much damaged, the house was not destroyed.

The Dearth of Houses.

The dearth of houses in Birmingham was one of the subjects discussed at the meeting of the Trades Council recently, when a deputation was appointed to wait upon the Lord Mayor in reference to the matter.

Royal Institute of British Architects.

We are asked to announce that the general meetings of the Royal Institute of British Architects will in future be held at 4 p.m. instead of 3 p.m., as announced in the *Kalendar* and other publications of the Institute.

London County Hall.

It has been decided to suspend operations in connection with the erection of the new London County Hall. This step, it is stated, has been taken at the instance of the Ministry of Munitions, which desires to have the workmen released for the purpose of aiding in the construction of munition factories in various parts of the country.

Site of the Old Royal Infirmary, Manchester.

The question of what use shall be made of the site of the old Royal Infirmary in Piccadilly, Manchester, is again to be discussed by the City Council, a resolution having been passed to rescind all existing resolutions on the subject and to reconsider the question. Among the suggestions previously made were that an art gallery and library should be erected; that the site should be used for tramway purposes only; that it should be retained as an open space, and that it should be used as a military drilling ground.

Greek Reliefs.

Mr. A. Hamilton Smith, Keeper of Greek and Roman Antiquities at the British Museum, read an illustrated paper on the 8th inst. on "Some Greek and other Reliefs Recently Acquired by the British Museum," before a meeting of the Society for the Promotion of Hellenic Studies held at the Society of Antiquaries' rooms, Burlington House. Photographs were shown of votive and tomb reliefs, the latter including single figure, double figure, and group examples. Mr. Smith mentioned that one of the Greek reliefs recently acquired was found in a London builders' yard, where it had lain for some years. Another was found in Jersey, where it had formed part of the pavement of a cottage yard, fortunately having been placed face downwards.

British Museum Closing.

The Director of the British Museum announces that, in accordance with the decision of the Government, the exhibition galleries of the British Museum (Bloomsbury) and certain of the galleries at the Natural History Museum will be closed to the public on and after Wednesday, March 1. The Reading-room (including the newspaper-room) will remain open to ticket-holders as before, except that from March 6 it will be closed at 5 p.m. instead of 7 p.m. until further notice. The room will be closed for cleaning, as usual, on March 1 to 4. The Students'-room of the Department of Manuscripts will remain open so long as sufficient staff is available for its service. Due notice will be given if it should be found necessary to close the room, in which case arrangements will be made for the supply of MSS. in the North Library for the use of such students as may satisfy the Director that they are engaged in studies of serious importance. The students' rooms of the other departments at Bloomsbury will be closed. Applications for access for special reasons should be addressed to the keeper of the department concerned. The photographic studio will remain open under the usual conditions. The students' rooms at the Natural History Museum will continue to be accessible to approved students.

An Architect's Estate.

Mr. John Sutcliffe, of Hazelwood, Hebden Bridge, architect, whose death occurred January 2 last, has left estate valued at £15,240 4s. 11d. with net personalty £8,931 19s.

Town-Planning Lecture in Madras.

His Excellency the Governor presided at the opening lecture on Town Planning which Mr. H. V. Lanchester, the Town-Planning Adviser to Government, delivered at the Engineering College. Mr. Lanchester's inaugural address was devoted to the ethics of town planning.

New Luton School.

The Education Committee of Beds. County Council reported at their last meeting that an architectural competition for designs for a new secondary school for girls at Luton had been carried out, and a set of designs prepared by Messrs. J. R. Brown & Sons, of Luton, had been selected. No steps can be taken at the present time with a view to commencing the building of the school.

The Old Windsor Elms.

The Windsor Town Council have decided to cut down between twenty and thirty old elms in King Edward VII. Avenue, near Windsor Castle. During a gale one of the trees fell across the roadway, and a committee was appointed to inspect the trees and report. It was decided by nine votes to eight that all the elms should come down, including the four trees forming part of the avenue to the Castle, subject to the approval of the Woods and Forests Department.

Artists' Rifles, O.T.C.

One effect of the Earl of Derby's recruiting scheme has been that a large number of professional men from the technical trades, including architects, engineers, and surveyors, having realised that they must no longer delay offering their services to the country, have applied to the Artists' Rifles, O.T.C., for direct enlistment. Moreover, of those who have attested under the scheme, many have felt impatience for their groups to be called up, and, solving the problem for themselves, have applied for and obtained transfer from Army Reserve B, in which Derby recruits are placed, to some regular or Territorial unit. This course is favoured by men whose education and social position render them eligible for commissions. The transfer of men who have been placed in Army Reserve B may be effected as soon as possible after they have been approved and found medically fit, or postponed until a later date, provided that at such later date the requirements of the service require the transfer. The corps has a special class for training members who desire to obtain commissions in the Royal Engineers and Pioneer Battalions, and for testing candidates for such commissions.

The Mineral Resources of Great Britain.

The Board of Agriculture and Fisheries desire to give notice of the publication of three volumes of Special Reports on the Mineral Resources of Great Britain, which have been prepared by the Director of the Geological Survey in response to numerous inquiries that have arisen through the conditions brought about by the war. In Volume 1 the uses, distribution, treatment, and output of tungsten and manganese ores are dealt with, and particulars of the mines, active and inactive, are given. Price 1s. The second volume deals with the sources, uses, and treatment of barytes and witherite (the sulphate and carbonate of barium). The mines from which the minerals are or have been raised are described in detail. Price 1s. 6d. Volume 3 of the series deals with the properties, uses, treatment, and modes of occurrence of gypsum, anhydrite, celestine, and strontianite. Details of the workings in all parts of Great Britain are given, with statistics as to output. Price 1s. Copies may be obtained through any bookseller from Messrs. T. Fisher Unwin, Ltd., 1, Adelphi-terrace, London, W.C., who are the sole wholesale agents to the trade outside the County of London; or from the Director-General, Ordnance Survey Office, Southampton.

CHARING CROSS BRIDGE.

AN inspection of the drawings deposited with the South-Eastern Railway Company's Bill reveals the fact that it is intended to strengthen the eastern half of the existing bridge by encasing the iron columns in stone work and building segmental stone arches between them. These are to be 25 ft. high in the centre above Trinity high-water mark and 15 ft. high at the springing, which leaves a space of 7 ft. between the intrados of the arches and rail level.

In order to convince the powers that be that the proposals are reasonable, elevations of Waterloo and Westminster Bridges are submitted. The former has arches of 120 ft. span with elliptical arches, with height in the middle of 20 ft. 6 in. The latter has eight arches of spans varying from 120 ft. to 94 ft., and heights varying from 20 ft. to 15 ft. 6 in. The new arches will be of spans varying from 147 ft. to 140 ft., owing to the fact that there are no projections required next existing piers.

The spans and heights are ample, but the appearance from the bases of the new composite bridge, with its unequal spans and the weakness of the iron columns conspicuously emphasised by contrast with the new piers behind them, and the western half of the lattice bridge overhanging the stonework will be worse than it is at present.

The present time is perhaps hardly one in which to press for æsthetic considerations nor to hinder a railway company which is doing great national service in the perfection of its arrangements, which demand a fuller use of this bridge. At present it can only carry two trains at one time, and it is now felt to be necessary that it should be able to carry four trains at one time. But it is by no means clear that the work, which is estimated to cost £150,000, will be completed in time to be of use for the emergencies for which it is required, nor can we see why it should not be possible to entrain and detrain troops at the Waterloo Station by temporary arrangement with the London and South-Western Railway.

The outlay contemplated is not large, and possibly the extra ugliness achieved by it might hasten the removal of the bridge, but we think there is a much more urgent reason for opposition than that caused by the appearance of the bridge, and that is the fact that, despite the need for economy which will inevitably impede all such schemes, the necessity for a road bridge at Charing Cross is so great that any outlay now which would make its ultimate realisation more difficult should be opposed.

Waterloo and Westminster Bridges are inadequate at their best, and with weakening foundations and increased loads either may have to be closed at any time. This would throw extra work on the other, and the traffic obstruction would be insufferable.

We hope, therefore, notwithstanding all that can be said for emergencies, that this expense will not be sanctioned.

◆

ARCHITECTURAL SOCIETIES.

The Architectural Association of Ireland.

An ordinary meeting was held on Thursday, February 3, when Mr. R. M. Butler, F.R.I.B.A., read a paper on "The Gothic Revival and its Effects." Mr. H. G. Leask presided. The paper traced the revival of Gothic architecture, which had fallen into disuse for some hundreds of years, from its first beginnings, at a house commenced by Horace Walpole in 1753 and finished in 1770 at Strawberry Hill, which was rebuilt in "the Gothic taste," as it was then called, and explained some of the causes of the failure of the revival to re-create a living style of architecture such as existed in the Middle Ages, and referred to the influence it exercised upon modern architecture of the present day in these countries. Walpole's initiative set the fashion, and later the novels of Sir Walter Scott had no small share in popularising the taste for Gothic. The earlier churches and houses built in the style were mere travesties of mediæval art, as their designers were ignorant of its principles. The first important building in England built in this style was the Houses of Parliament at Westminster, designed by Sir Charles Barry in 1835, who was assisted in the design of the ornamental details by A. W. Pugin. It was one of the finest modern public buildings in Europe, and far and away the best erected by the British Government. Later, the influence of Pugin's writings, the great Exhibition of 1851, the publication of the works of John Ruskin, the Oxford Movement, and a variety of other causes led to Gothic becoming the dominant style of the mid-nineteenth century, eclipsing traditional English classical art, which had prevailed until well into the century. By 1850 Gothic was in full swing in England, and had been introduced into Ireland, and to doubt its superiority was considered evidence of bad taste; it was then deemed the only possible style for a Christian church. Gothic also came into vogue for secular purposes, but the modern version was an incongruous and artificial form of design, in that it neglected alike the traditional elements of the old domestic work and the conditions of modern times. The growing cheapness of foreign travel, the writings of Ruskin, and other factors brought about the introduction of foreign and exotic features, the taste for which rapidly developed, proving a wholly regrettable influence, which tended later to discredit the revival movement. The copyism and adaptation of mediæval architecture was carried out too literally and with too little regard for modern requirements and conditions. In the late "seventies" a change took place in England, the foundations of a fine school of domestic architecture, superior to that of any other country, were laid, and the ecclesiastical side of the movement took on a newer and more living character. The pioneers of this latter phase were the late J. D. Sedding, the architect of Holy Trinity Church, Chelsea, the late G. F. Bodley, R and J. F. Bentley, the architect of the Westminster Cathedral, who succeeded recovering a good deal of the quality of medi art, but adapted to modern needs. The w of this period in England might be descri as the best modern ecclesiastical work Gothic type in the world, although it could be said that the Gothic revival as a w had been a great success from the standp of the advancement of architecture. Gothic revival in Ireland followed on sim lines to that in England; it was not progres in character, but adhered to the early i and to the foreign influence which had d so much harm to English architecture be it was discarded in that country. The Go revival in Ireland had failed to create re great architecture, partly because of its en disregard of native Irish traditions in ar tecture, and by reason of the extent to wh it fell under English and foreign influ in the beginning. It was lamentable that effort was made to derive inspiration f the native remains. Nevertheless, some v creditable work was done. The lect referred to the difficulties under which Irish people laboured at the time the g church building era began in this coun and the absence of great mediæval traditi like those of England, although Ireland possess a distinct mediæval Gothic architect of its own. The Gothic revival had d relatively greater harm to the art of architect in Ireland, because it destroyed the class traditions that prevailed in the eightee and early nineteenth century, when the pu buildings and mansions of Dublin riva those of London, and set up nothing equ good. The lecturer finally described the and progress of the modern school of Got architecture in America, which has now reac an exceptionally high level. The m important churches and colleges in the Uni States are designed in this style, includ the immense work recently finished at West Point Naval Academy. The lecture illustrated by a large number of lantern vi of modern English and Irish churches, slides of American Gothic architecture, for the occasion by Mr. Ralph A. Cram, Boston.

On the motion of Mr. Beckett, seconded Mr. Lynch, a vote of thanks was passed to lecturer.

◆

FIFTY YEARS AGO.

A Self-Loading Ship.

M. DE CORAUX, a Lyonnese, has invent and constructed a ship which can load unload itself automatically in forty minut The captain and the mechanician are t only living crew on board, the working a manipulation of the vessel and cargo bei all performed by steam applied to m ingenious machinery. The loading is carri on by trucks and wagons, which can conta corn, flour, bales, cattle, horses, barrels, e The vessel is, as may be expected, of peculiar disposition; but its exterior bea all the signs of seaworthiness. The gre revolution is on the deck and in the interio The former is covered with lines of ra reaching from one extremity to the othe while, at midships, there are two turntable Front and rear are two or four immen cages, containing eight, twelve, or sixte wagons, of the same size as our railwa wagons. The rails on which the wago rest are adapted exactly to the rails of th deck. A cable is hooked to the wagon which traverse the deck throughout i length; and the stern of the boat havin been previously placed on a level with th quay, which is also furnished with rails, may be perhaps a portion of a terminu the wagons glide without the least interru tion from the vessel to the land, and *vi versâ.*

[*** We give the above extract from th *Builder* of February 17, 1866.—ED.]

CONSTRUCTION SECTION.

EMPORARY BUILDINGS FOR WAR PURPOSES:

II.—SUBSIDIARY POINTS OF IMPORTANCE.

BY T. P. BENNETT, A.R.I.B.A.

THE broad and important principles which must govern any scheme of temporary buildings have been set out in a previous icle, but after these have been settled there many things which must be borne in mind l which must receive careful consideration ore the buildings are satisfactorily complete.

'he elevations call for attention. In a manent building they call for primary ention, but in a temporary scheme they must e a place of distinctly secondary importance. is impossible, however, to ignore them gether, and the treatment of the detail will urally receive the attention of the architect. special features can be introduced—every t must be absolutely necessary to the icture—and it is only in the handling of ctical objects, general massing, and the use aint that originality can play its part.

well-proportioned building is extraordiily effective, and well-proportioned openings likewise of the greatest value. In the ign of many buildings the set conditions he problem dictate the general lines of the iposition, and several distinct classes of ldings will therefore be considered in turn.

n designs involving the housing of munitions kers or aliens in compounds the dining hut often the building of greatest importance, by reason of its prominence upon the eral plan it will attract attention. quently these buildings are 50 ft. wide and covered with a Belfast roof. In these cases unwise to introduce roof-lights, because by oing difficulty will be experienced in dealing the purlins. Ventilators should be placed ve the centre at intervals of about 25 ft. 0 ft., and should be constructed either with ies hung on centres or with louvres. This he only means of breaking the sky-line that be employed, as chimney-stacks will not t. Beyond the general lines of the buildings eaves and the windows are the only points ng any opportunity for treatment. The es may, however, be given a large projection, by this means produce an effective shadow, e a continuous band of windows between posts carrying the trusses is both logical attractive. The doors break the monotony ne front and may be made points of interest. etch for such a building is shown in Fig. 1. roof is covered with felt and the sides weather-boarding.

ffice buildings give rather more scope, use in many cases the arrangement of rooms allows a certain amount of latitude. ectangular building must be considered st a necessity, owing to the importance of and speed of construction, and too much ce cannot therefore be entertained. Lava- blocks should be connected to the main ling by a short corridor, as in hospital truction, or else built outside the main formed by the boundary of the principal s and entered by a door in one side By this means all the plumbing is accesfor repairs, and leakages from defects to hurried construction do not injure the unding structure. If such defects exist can, moreover, be seen and remedied. hard internal surface is required, it is cheaper to use 4½-in. brickwork rendered sides for the lower part of the sanitary wings than to employ brick nogging and plastering. The surface of the cement looks well when distempered cream colour or tarred, which will respectively be in contrast to or in harmony with a dark-stained weather-boarded building. The picturesque nature of these blocks is indicated in Fig. 2, as is also the hipped end to the roof, which was previously mentioned as desirable for the sake of stability. A plinth can be added where continuous sleeper walls are used by distempering or tarring the brickwork. All office blocks should have these sleeper walls, as they will otherwise be extremely draughty. Huts of a very temporary nature for munitions workers and others are weather-boarded down to ground level only and built upon piers. Housing schemes must likewise be planned upon a plain rectangular lay-out. Curves or unusual angles or a variety of designs and variations must be avoided. All of these things cause delay and expense, and, however desirable they may be from an artistic point of view, they should under no circumstances be allowed. Three or four types of buildings must be arranged and the whole of the dwellings must be made to conform to these types. Alterations should be made in colour and occasionally in material, but these alterations do not affect the general setting out and commencement of the work.

A plan and elevation of a block of buildings for such a scheme are shown in Figs. 3 and 4, and in this arrangement it will be noticed that sections containing any multiple of two houses can be erected with equal facility. By this means the whole length of a road can be set out from one group of dimensions. The angle houses are shown to be of two stories. This is permissible upon both architectural and practical grounds. The former needs no explanation, and for the latter it will be easily realised that in all factories there are a considerable number of leading hands and foremen, who demand, and rightly demand, a superior dwelling to that occupied by the ordinary workers. The angles of the roads are the best sites for these superior dwellings, and allow for the housing of foremen next to workers, where day and night shifts are worked. One set of men do not by this means disturb the others when they go on duty.

Disconnected blocks are preferable to continuous terraces from a hygienic point of view and for purposes of drainage. Brick stacks and fireplaces should be employed in dwellings, owing to the serious risk to human life which would occur in case of fire.

Weather-boarding is the most common and most effective material for the sides of all structures, and, as previously mentioned, is also the cheapest. Rebated weather boards should be employed in huts used as habitations. Sometimes the surface of the wood is left rough, but the knots make it unsightly. The best finish is given by two coats of carbolineum "Stop rot," or "Solignum." These materials can be obtained in many good colours; they are cheap and can be applied rapidly, and if necessary by unskilled labour. Wrot woodwork must be painted, but priming with red lead can be omitted, and "Duresco" used in its place. One coat of "Duresco" and two coats of lead and oil colour are sufficiently good for all purposes. Many colour schemes will suggest themselves, but white or battleship grey, coupled with brown boarding, is most effective, although dark green will look well in some situations. Brickwork is generally built with Fletton bricks, and in order to avoid its unsightly appearance it can be coated with tar or distempered. In the case of buildings constructed with 4½-in. walls reinforced with hoop-iron, and rendered inside, tar for the bottom portion and cream or yellowish paint or distemper for the upper half will give a delightful effect at a very small outlay. C.I. gutters and R.W.P.'s of light iron are used if iron is permissible, and are painted two coats. In certain buildings used for projectile factories lead and iron may not be employed, and in these cases wood "V" gutters are used and zinc or tinned metal R.W.P.'s.

The finish of the interior must next be the subject of consideration. Many buildings require no special lining, and the rough woodwork plaster, or brickwork is merely distempered. This applies to stores and factories, except those in which the walls must be dust-proof. For rooms which have to present a better appearance, 3-ply boarding was at the commencement of the war generally employed. The cost ran about 7s. 6d. per square for second quality, 3–4 mm. in good sizes. The price is now about 13s. 6d., and is becoming prohibitive. Three-ply is expensive to fix owing to the fact that it is necessary to insert nogging pieces to take the horizontal edges. Some of the substitutes are very absorbent, and will not stand rough wear, and for these reasons they are to be avoided. Matchboarding is the most satisfactory material and is easily obtainable. As it is covered by no patent it can be turned out from any mill, and this point is often of great importance. Uralite and other asbestos boards are to be preferred in places where fires are likely to occur, though the cost is somewhat in excess either of 3-ply or matchboarding For office linings, plaster slabs screwed to the studs make the best finish, and up to the present no difficulty has been experienced in obtaining large quantities. Nogging pieces must be inserted as in the case of 3-ply and Uralite to take the edges. Dust-proof buildings are lined with match-boarding covered with two coats of varnish.

The fireproofing of wood buildings requires consideration, and, as suggested above, it is necessary in some cases to line them throughout with Uralite. Certain other precautions should, however, always be taken, the first of these being the rendering of the roofing felt. Many of the felts employed are very liable to ignite if sparks fall upon them, and to guard against this they should be covered with a coating of cement grout laid on with a brush; ½ in. of cement rendering has been tried, but it is found that the sagging of the roof causes the cement to crack, the cracks hold water and cause the roof to leak. Asbestos sheets must be placed at the back of stoves, and sheet-iron or asbestos should be put for them to stand upon. Where sheet-iron stove pipes are employed they should be passed through a sleeve in the wall or roof made of a section of glazed earthenware pipe and filled with cement. Where the pipe passes through the wall immediately at the back of the stove, and the latter is likely to be heavily banked with coal, this precaution will be insufficient, and the partition must be built of brickwork or brick nogged for an area of about 2 ft. by 2 ft. around the pipe.

The surface of the studding where the buildings are used as offices or as private dwellings should be covered with lining felt before it is weather-boarded, in order to make the huts draught-proof, and to maintain an equable temperature.

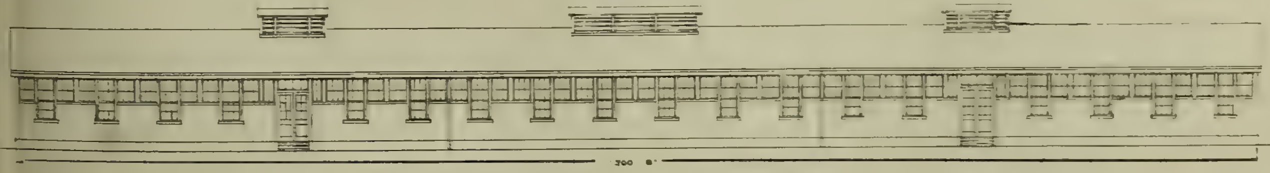

Fig. 1. Elevation of a Dining Hut.

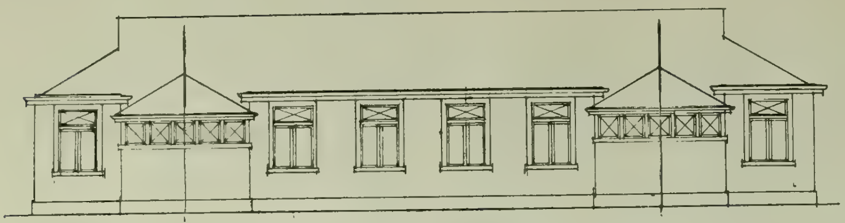

Fig. 2. Elevation of an Office Building showing Lavatory Blocks.

Heating in separate buildings of a maximum size of about 80 ft. by 20 ft. should be by means of a C.I. stove with a sheet-iron pipe passing through the wall at the side of the building, and carried above the roof. Larger buildings than this should be heated by means of a low-pressure hot-water system. If a central system is adopted, flues are avoided and the concentration of fuel and labour causes economical working when the buildings are in operation. Delay may be experienced in obtaining pipes and radiators, and these should therefore be ordered as soon as possible. Galvanised pipes are almost unobtainable.

The cost of the buildings varies enormously, and it is extremely difficult to give any figures which will be of value. As a basis, however, the following prices may be used. An office building, built with studding weather-boarding, boarded floors, boarded and felted roofs, and glazed steel skylights, the inside of walls and ceilings lined with plaster slabs, the whole complete with foundations, could be built for 4d. per foot cube six months ago for contracts larger than £10,000 on accessible sites. The cost at present would be about 4½d. This is exclusive of a railway or other special means of access. Measurements to be taken from the top of concrete to half-way up the roof. Buildings under £2,000, in different places, run, however, to as much as 8½d. per foot cube for exactly similar construction, so that some idea may be gained of the extreme range of prices that are received. The timber taken alone will cost from about 1d. to 1½d. per ft. cube of the building. This figure may be useful if the Government method of purchase is adopted, a system which, in spite of the adverse criticism it received twelve months ago, is proving one of the finest commercial transactions carried out for any Department since the commencement of the war.

With the question of cost is closely allied the question of saving either wisely or unwisely. The former may be considered first, and for the moment may be confined to questions of material and construction rather than to those of organisation and planning. Among points of permissible constructional saving may be placed the reduction of all scantlings. This may be made a very fruitful source of economy. Economy in the construction of floors may be secured in the case of hospitals by laying sheets of corrugated-iron upon wooden joists and covering the same with asphalt, the asphalt to be ½ in. thick over the top of the corrugations. By this means all the cost of filling and concrete is obviated. Interior woodwork in roofs can be wrot and coated with Solignum instead of being lined. The roofs and walls of stores are seldom lined and are generally distempered. Such a building, however, is very draughty. Doors may be 1½ in., windows devoid of mouldings. Architraves, 2½ in. by ¾ in. strips obtained very frequently from waste and off-cuts. Saving should not be effected in roof glazing, where it may leak and cause endless discomfort, unsightly water stains, and large amounts for subsequent repair. Patent systems executed by reliable firms should be employed if possible. If the conditions of the factory preclude the use of metal bars, wood must perforce be employed; but they should then be of substantial section and perfectly rigid. Cheap material or workmanship should never be allowed in gutters, and sanitary fittings should be plain solid patterns of reliable manufacture.

Ranges of lavatory basins may be obtained which have a channel cast as part of the fitting, or an open channel on the floor. In either case the use of several traps is obviated and a large amount of plumbing is saved.

Patent fittings and patent ventilators should be avoided as far as possible unless it is definitely known that a good stock is held and is immediately available.

The preparation of the drawings needs careful supervision, and they should be made so that they will fully explain the scheme, but do not contain unnecessary or elaborate detail. It is highly important that they should be well dimensioned and that the dimensions should be accurate. They should also be fully coloured in distinct colours, and if executed by a large number of draughtsmen they can be made look thoroughly workmanlike if one man d the whole of the printing. Walls and ot parts should never be blacked in.

Good prints can be obtained from pen tracings upon tracing-paper, and the letteri can be easily read if it is added in ink. It be necessary to make a set of drawings for e builder who is asked to tender and to send to his office.

A tender can be prepared for almost a temporary scheme in six days, and the w can be executed with great rapidity if it properly organised. Fifteen thousand poun worth of temporary offices, built in t blocks, have been erected ready for occupat in five weeks. A small store with an of attached has been completed in seven da the cost being £800; £50 of this was due speed alone.

Continuous Sunday work or long hours overtime are only means of wasting mo and should never be allowed unless two ga are employed. For extremely urgent w this is generally done, but for other cases th or four hours is the maximum continu

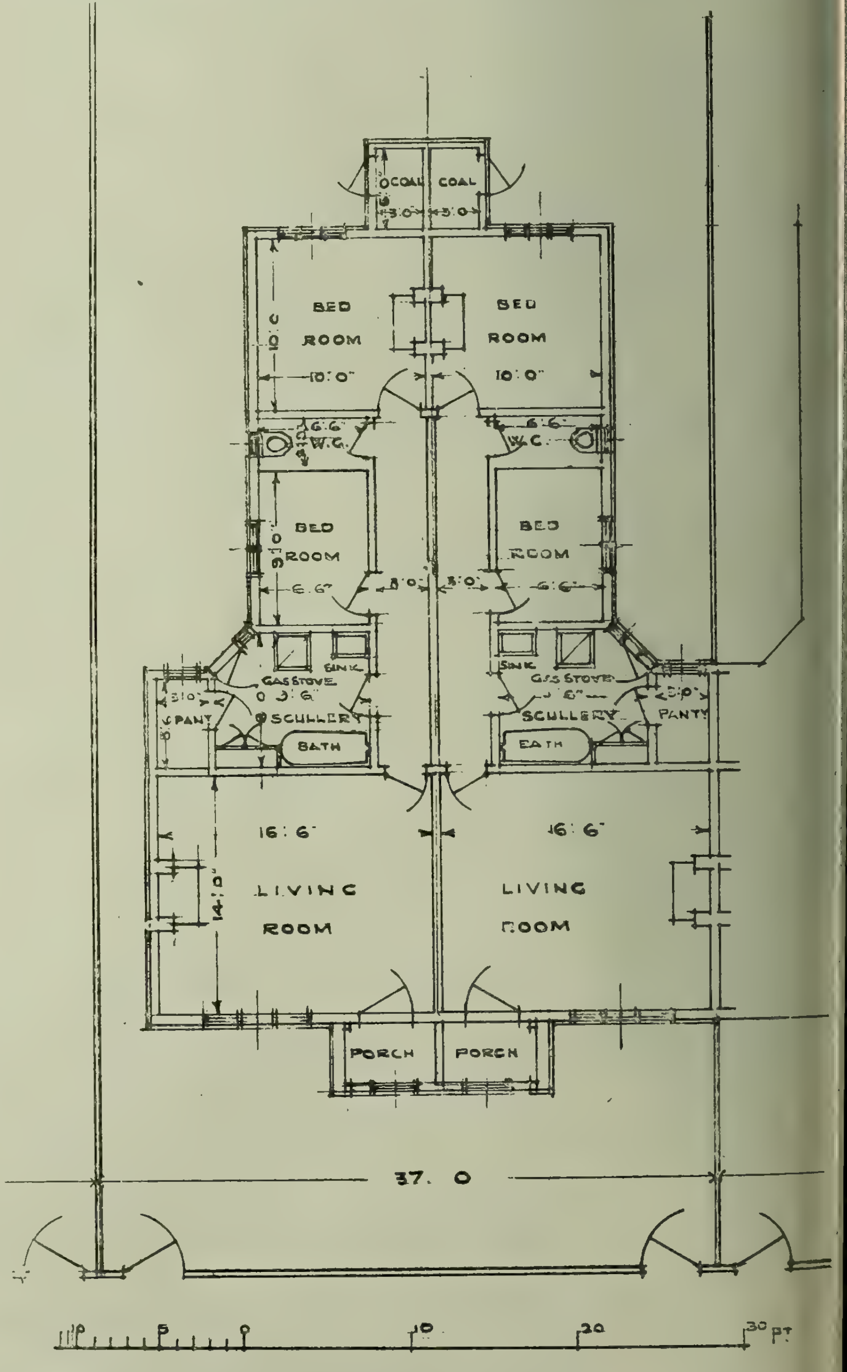

Fig. 3. Plan of Four Houses in a Scheme for Housing Munitions Workers.

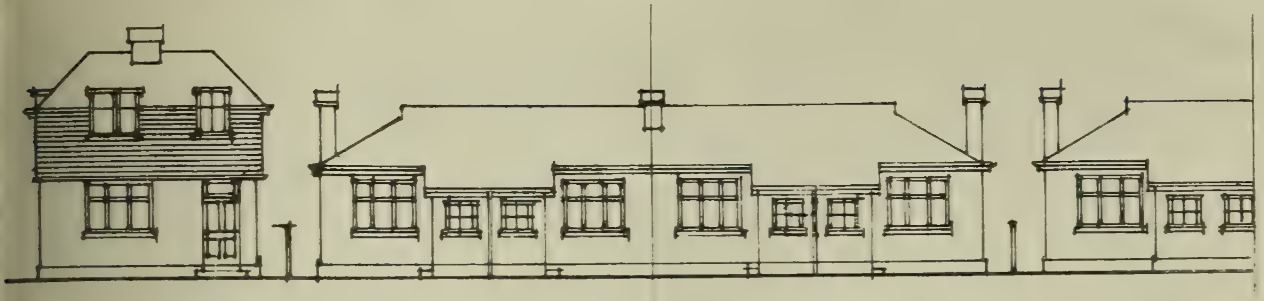

Fig. 4. Elevation of Part of a Scheme for Housing Munitions Workers.

ime that should be worked. Saturdays l be early days, and no Sunday work l be executed.

asional Sundays are, however, most ble and will not interfere with the output g the ensuing week. Penalties and ses require careful handling. It must be in mind that the users cannot move into tructure unless they have received due and have been able to make preparations. ierefore, the building is unexpectedly ed four or five days before it is due and contractor receives a large bonus, it is possible that it will remain unoccupied large portiòn of the time so gained.

easonably short time should therefore be and the contractor bound to his date, the tect doing everything in his power to No bonus should be offered and no ty enforced. There are, however, certain in which this rule will not produce the d result, and a bonus must then be d.

E ALBION MOTOR-CAR OMPANY'S NEW WORKS, COTSTOUN, GLASGOW.

E two buildings recently erected at toun, Glasgow, for Messrs. Albion Motor-ompany, Ltd., afford good examples of hops and stores built in reinforced ete.

first block was built in 1913, and is 200 ft. long, 60 ft. wide, and 60 ft. high. irst and second floors are used as stores, ere designed to carry a load of 3 cwt. per e foot. The third floor is used as a ne shop, and its construction is therefore r than that of those below. Access is ied to an adjoining building on the first by means of a small reinforced concrete , 40 ft. long and 10 ft. wide, which spans ered roadway.

second and newer building is 60 ft. from the older one, the intervening space roofed over to form a one-story building. concrete buildings are of the same over-all sions, but the construction of No. 1 is hat different from that of No. 2, the details ich are described in this article, as all the floors of No. 2 are devoted to workshops. Longitudinally the building is divided into ten bays by main columns about 20 ft. apart, and transversely into three bays of the same dimension. The site being near the River Clyde, it was found necessary to carry the foundations of the columns down to a depth of from 6 ft. to 8 ft. below the ground-floor level in order to reach a stratum of boulder clay which was estimated to withstand a pressure of 3 tons per square foot.

The cantilever beam foundation was adopted to avoid cutting through an existing concrete slab foundation of a brick wall, and also to prevent any extra load coming upon it. The wall being properly shored up, sheet piling was driven close to the existing foundation for a length somewhat longer than the new base, which is of oblong shape, to prevent the earth from falling away and letting the wall down when excavations were being made. After the base was cast a reinforced concrete cantilever beam was constructed, one end projecting 2 ft. 6 in. over the existing foundation to receive a column and the other end being tied down to a side column.

In another instance, where a concrete column happened to coincide with a steel stanchion of an existing building, two bases were formed 5 ft. from either side of column, columns were then brought up from them sufficiently high to clear the foundation of the stanchion, and a reinforced concrete beam 4 ft. deep and 20 in. wide was placed across, from which the new column is supported.

All the external columns are 18 in. wide on the face and 20 in. deep at the bottom, diminishing to 12 in. at the top, and are reinforced with Kahn rib bars and $\frac{3}{16}$ in. diameter binders.

The internal columns are of octagonal section, varying from 21 in. at the bottom to 10 in. at the top, and are reinforced with spirals and Kahn rib bars. The first, second, and third floors were designed to carry a superimposed load of 200 lb. per square foot, the slabs being 4 in. thick, secondary beams 18 in by 8 in. (three per bay of 20 ft.) and main beams 22 in. by 12 in.

The roof is designed to carry a load of $\frac{1}{2}$ cwt. per square foot, and the pitch is obtained by canting the beams and thickening the slabs; the latter are therefore 4 in. thick at one end and 5 in. at the other. Secondary beams are 16 in. by 6 in. (two per bay of 20 ft.) and main beams 20 in. by 9 in. The top floor is lighted from above by a glass lantern light carried on concrete trusses 10 ft. apart, the bottom ties being 16 in. by 6 in., posts 6 in. by 6 in., rafters 8 in. by 6 in., and ridge beam 14 in. by 6 in. The roof is waterproofed with asphalted felt.

Numerous holes 3 in. in diameter have been left in all the internal beams to permit cables, small pipes, and electric wiring to be drawn through and supported. These holes are below the neutral axis of the beam, and therefore do not theoretically weaken them.

The ground and first floors are used as fitting shops and are paved with granolithic. The three lines of benches that run longitudinally are served by a corresponding number of overhead runways, which are carried from the secondary beams by short lengths of angles bolted to them through holes formed of iron barrel, which were cast in with the beams.

The concrete was mixed in a mechanical mixer in the proportions of four parts of whinstone or granite chips, two parts of sand, and one of cement.

Building operations were commenced at the end of 1914, and completed about the middle of last year. The general contractors were Messrs. George Roome & Co., Ltd.

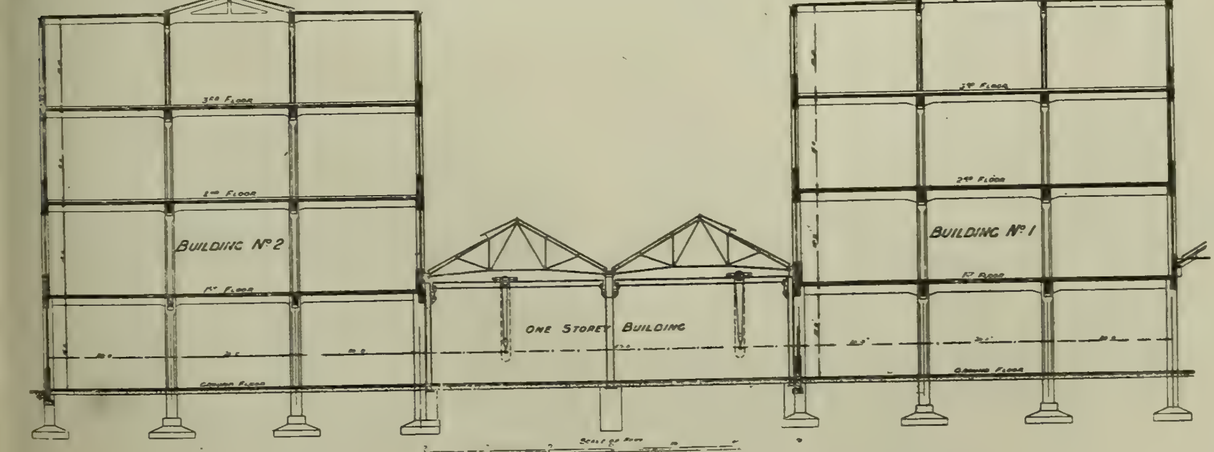
The whole of the reinforced concrete is executed on the Kahn system, and it was designed by the Trussed Concrete-Steel Company, Ltd., Caxton House, Westminster.

HARRIS ACADEMY, DUNDEE.

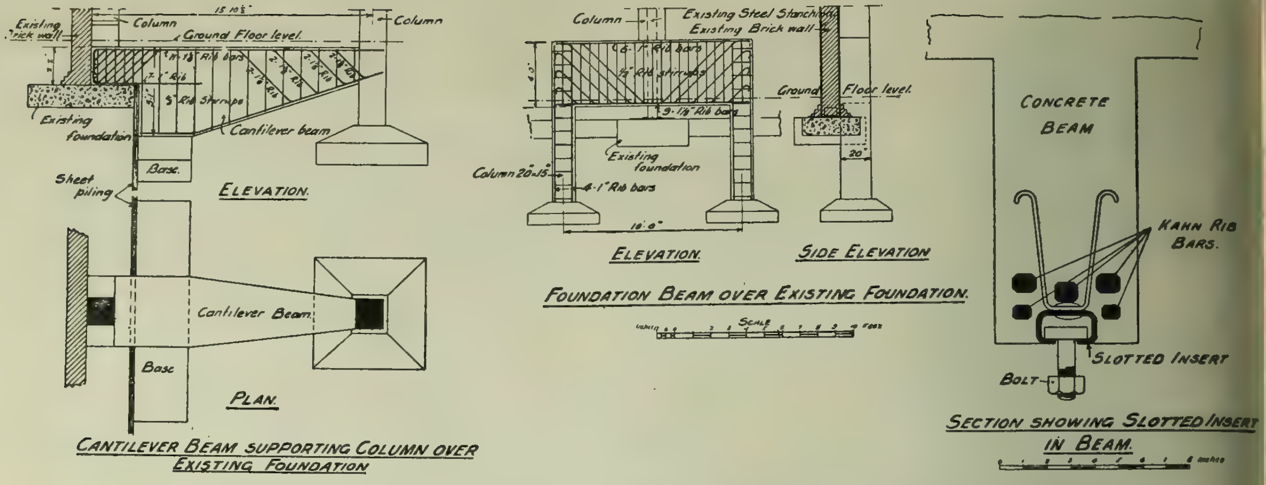
With reference to the plans of Harris Academy, which were illustrated in our last issue, the author of the accepted design is Mr. W. B. D. Keith, not Mr. A. W. D. Keith.

SCHOOL, MENAI BRIDGE.

A new elementary school was formally opened at Menai Bridge recently. The school stands a short distance from the town on the Llanfair road, and accommodation is provided for 292 mixed and infants. The architect was Mr. Joseph Owen.



The Albion Motor-Car Company's New Works, Scotstoun, Glasgow.



The Albion Motor-Car Company's New Works, Scotstoun, Glasgow. (*See page* 145.)

STANDARDISED ALL STEEL EMERGENCY BUILDINGS.

The war, while it has stopped many forms of building, has given an enormous impetus to others, and the makers of every form of temporary building have seen a practical proof of the old saying, "It's an ill wind which blows nobody good." Every kind of material which is used for temporary buildings has its advantages and disadvantages, and iron and steel have the great merit of being less liable to destruction and damage than lighter and more destructible materials. The Trussed Concrete Steel Company, of Central House, Kingsway, London, W.C., have devoted their attention to the perfecting of a system which is well adapted to emergency requirements, while at the same time the resulting structures are waterproof, strong, and wearable. Three men in four or five hours can put up a large hut, leaving it ready for immediate use. The units are formed of pressed steel, each 4 ft. by 7 ft. in height, and, unlike other systems, these plates are panelled so that they present a pleasing appearance and surface. The units are grooved, flanged, and slotted along their edges, so that an absolutely weathertight interlocking joint is formed with the next unit, while stability is ensured by an ingenious system of wedging, the roof trusses, of a simplified king-post form, with their braces, helping to keep the structure rigid throughout. Sheet steel forms the roof covering, the sheets being overlapped and interlocked in a way which provides watertightness.

Everything in connection with the huts except the flooring boards and posts is vermin and ant proof, and substitutes for wooden floors could be provided if required.

Skilled labour is not necessary either for erecting or pulling down the buildings, while the units can be packed in small compass, which renders them admirably suited for pioneering or campaigning purposes. Foundations are not usually needed, as sleepers are ordinarily sufficient, and if they should be wanted the roughest concrete sleeper walls would serve every purpose.

Doubtless such a system as we have described and illustrated in the photographs given provides just what is necessary in connection with the demands of war, while when the devastated regions of Europe have to be rebuilt such a system will meet special requirements of the time.

◆

NEW GOVERNMENT CONTRACTS.

War Office.

Apparatus, Warming, Hot Water.—G. N. Haden & Sons, Lincoln House, Kingsway, W.C.

Boilers.—Beech, Hill, & Co., Ltd., Gunslane Foundry, West Bromwich; A. Kenrick & Sons, Ltd., West Bromwich; T. Sheldon & Co., Spring Vale Foundry, near Wolverhampton; J. & J. Siddons, Ltd., West Bromwich.

Bolts and Nuts, etc.—Bayliss, Jones, & Bayliss, Ltd., Wolverhampton; F. W. Cotterill, Ltd., Atlas Works, Darlaston; J. Gadd & Sons, Ltd., Blackheath, Birmingham; T. Griffiths & Co., 69, Bilston-road, Wolverhampton; Hampton & Dean, King's-hill, Wednesbury; Horton & Son, Ltd., New Alma Works, Darlaston; A. E. Jenks & Cattell, Heath Town, Wolverhampton; J. C. Prestwich, Ltd., Atherton, Manchester; J. Wiley & Sons, Ltd., Eagle Works, Darlaston; W. M. Winn & Co., Station Works, Darlaston.

Buildings, Portable.—Humphreys, Ltd., Knightsbridge, S.W.

Cement.—Associated Portland Cement Manufacturers, Ltd., Northfleet, etc.; C. & T. Earle, Ltd., Wilmington, Hull.

Cisterns (Term Contract).—F. Braby & Co., Ltd., Ida Works, Deptford, S.E.

Cranes.—Bedford Engineering Company, Houghton-road, Bedford; Butters Bros. & Co., McLellan-street, Glasgow; Holt & Willetts, Lion Works, Cradley Heath; Morrison & Mason, Ltd., H.M. Dockyard, Portsmouth; T. Smith & Sons, Rodley, near Leeds; Stothert & Pitt, Ltd., Bath.

Engines, Oil.—Blackstone & Co., 81, Ca street, E.C.; Crossley Bros., Ltd., Open Manchester; Petters, Ltd., 73, Queen Vic street, E.C.

Engines, Steam Pumping.—Merryweat Sons, Ltd., Greenwich-road, S.E.

Emergency Buildings.

THE BUILDING TRADE.

NORTH-WESTERN)ERATION OF BUILDING ADES EMPLOYERS.

ake the following from the January —

Apprenticeship Question.

g out of the Report and resolution National Federation on this question, een decided to recommend the Local ions to—Get into touch with the n authorities; co-opt members on the l Schools Committees; offer prizes to nical school classes; pay the school apprentices, and to keep an eye on hers' reports.

overnment and Wage Increases.

eliberations of the Government in the of securing national economy have e following statement being communi- y the Government Committee on ion to several trade unions imme- affected:—His Majesty's Government ven earnest attention to the financial of the country, to the great and g demands which will still be made resources to meet the needs of the war, the imperative need for economy in all f expenditure and consumption, both and private. They have also had o the general advances of wages that ready been given since the beginning ar, and to the measures already taken r limit the profits of undertakings. His s Government have come to the n that, in view of the pressing cy, any further advances of wages han advances following automatically isting agreements should be strictly to the adjustment of local conditions such adjustments are proved to be y. In conformity with this pronounce- e application of the joint shipyard or a wages advance of 15 per cent. ut the country has been refused by rd of Trade arbitrators.

cking and Bad Organisation on Government Works.

g out of correspondence with respect to acting of workmen by excess rates of and having been requested to give cases in support of the assertions made ng and bad organisation on Government the following have been sent up:— *ion Works, Blaydon-on-Tyne.*—Three joiners employed. Materials alto- adequate. Either too many men or supply of materials. Most of the employed to one-third their ordinary Of timber supplied, a considerable the best (redwood) split up by s with picks for firewood. Labourers to spread ashes. On finishing and what next, told to re-spread them. over a week on small patch of ashes.

Works.—One foreman had sixteen ers and seven labourers at work on of work. Average laying on straight- work 100 to 150 bricks per day told not to mind this, but wink at it. ,000 men at work, but 1,000 properly l would easily do what is being done.

on Camp.—Evidence furnished by a master builder who worked there x weeks. Arrived on job 7.10 a.m. re for charge hand. Not seen till ht o'clock. Put in a team of brick- long with a friend. No labourers. watch how other men worked and ork too fast. By noon had laid about bricks each. Taken off by foreman, that these two must set up two corners work two courses high only, and not any more. Reason given for moving that mates on previous job had complained of their rushing the work. The setting up of these two corners had to occupy that afternoon and all next day. On Saturday morning these men with ten other bricklayers put to a piece of work with not more than 100 bricks in hand, and told by foreman that they had to make them last till more came. No further supplies till Monday afternoon. In the meantime these men supposed to work, Sunday included, at double time. On a sewage section there sixty-nine bricklayers worked five weeks. This man says that at home, in normal conditions, he could have done the work in same time with six men.

Ripon Camp.—Evidence given by an influential trade unionist. A plasterer and labourer working together would do about 4 sq. yds. cement floating in a day. At home would have done more than this before breakfast. Many mixings of cement wasted, because of setting before the men would exert themselves to use it.

A Camp in Wales.—Told by foreman. Eight joiners boarding in a space where four were too many to work to advantage. Typical of the general conditions. Spars wanted 12 ft. long. Men set on to cut them by hand out of 20 ft. battens. Waste of material and labour.

Camp at Winchester.—Told by joiner. Many hundreds of new horse-cloths thrown on muddy ground for horses to exercise upon. Completely ruined.

BELFAST BUILDERS' ASSOCIATION.

The annual general meeting of this Association was held recently at 14, Arthur-street, Belfast, the President, Mr. R. B. Henry, J.P., in the chair. The Secretary, Mr. J. A. M'Auley, submitted the annual Report, which was unanimously adopted. It contained the following:—It is obvious that in the period under review no trade has been so greatly prejudiced by the war as our own, as the present is, of course, a most inopportune time for embarking on any building enterprise that can possibly be delayed. It is pleasing to record that the relationship between masters and men still continues good. There has been a great scarcity of labour during the period under review, accounted for by the departure of so many industrial workers to the war, and this had a very appreciable effect on the labour market. War bonuses at the *pro rata* rate of 3s. per week of fifty-four hours have been given to the carpenters and bricklayers, which pertains to the period ending May 1, 1916. The ground labourers and trades attendants have both received substantial increases to their wages during the year. The proposed alterations in the working hours of the various trades is at present under consideration. The membership of the Association remains unaltered.

AN ANNIVERSARY FUNCTION.

Mr. Edward Pollard, the well-known shop fitter, entertained a number of guests at the Holborn Restaurant on Friday, January 28, to commemorate the twenty-eighth anniversary of the day on which he started his business. Mr. Pollard, who is chairman of the company, took the chair, and read numerous telegrams of congratulation from those who have been associated with him in the firm and from other friends. In a subsequent speech he gave a brief sketch of his career from the time when he left home to look for a workshop at a rental of 10s. a week, to the present time. In the first year the average of wages paid was £15 a week, whereas in 1915 the wages bill of the firm was over £2,000 a week. He attributed his success to the help and sympathy received from the band of workers whom he had gathered together. "To work in a friendly way and to find happiness in work was the only thing worth working for, and he had found that nothing else paid so well. He believed in being on terms of good-fellowship with the humblest of the workers, and to encourage them to bring their difficulties to him, to work happily with them, and to let all share in any prosperity he had."

Mr. Barnes replied in a witty speech, in the course of which he said, "It was a wrong idea that men built businesses; they built themselves, if proprietors only gave them sufficient scope and elbow-room."

The proceedings terminated in the usual toasts, speeches, and expressions of goodwill to the firm and its directorate.

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Aberdeen.—The Plans Committee of the T.C. has passed the following plans:—Alterations at Nos. 269-271, Union-street, for Messrs. Pratt & Keith, drapers, per Messrs. Kelly & Nicol, architects; picture house, Wales-street, for Mr. J. P. Kilgour, merchant, per Messrs. Sutherland & George, architects.

Athlone.—The L.G.B. has written to the R.C. intimating that they had recommended the Treasury to grant a loan of £1,300 for the provision of a new cemetery at Clonown, Athlone.

Barnoldswick.—At a recent meeting of the U.D.C., a letter was read from the C.C. with regard to the proposed joint smallpox hospital for the north-west portion of the West Riding, stating that the various authorities concerned had practically decided upon a united scheme, but the mode of apportioning the expense and cost of maintenance was still in abeyance.

Barrow.—The T.C. has passed plans for a new joiners' shop and general stores and saw mills for Messrs. Vickers; also for twenty-five houses and one house and shop in Victoria-road, for Messrs. Banks & Co.

Birmingham.—The Town-planning Committee of the Birmingham City Council has resolved to ask the City Council to sanction an application to the L.G.B. for leave to prepare an amending scheme for East Birmingham.

Bournemouth.—The B.C. has approved of the following:—Amended plan, premises, the Square, Messrs. Bobby & Co., Ltd.; additions, 402 and 404, Holdenhurst-road, the Parkstone and Bournemouth Co-operative Society; covered yard, Glenarm, Withermoor-road, Messrs. J. A. Parsons & Son; amended plan, seven houses, Green-road, Mr. A. Barnes; amended plan of house, Chessel-avenue, Messrs. J. & W. Hayward; motor and cart sheds, St. Paul's-lane, Messrs. H. Newman & Son; four maisonnettes, plots 36 and 37, Firbank-road, Messrs. J. & W. Hayward.

Bray.—The U.D.C. has approved plans submitted by Mr. M'Carthy, Surveyor, *re* baths.

Bridport.—The West Bay Committee has arranged for the area at the end of the esplanade to be metalled at a cost of £50.

Buckie.—The authorities for the Buckie Harbour extension scheme have been informed by the Treasury that they are willing to grant the application of the Buckie T.C. for variation of the conditions attached to the advance promised from the Development Fund and for a further loan for the completion of the harbour extension works. The additional cost sanctioned is £40,000.

California.—The House of Representatives has authorised an expenditure of $500,000 to equip

---

* See also our list of Competitions, Contracts, etc., on page 150.

Mare Island, California, as a naval yard for the building of Dreadnoughts.

Carlisle.—The T.C. has adopted a revised scheme for providing thirty-six houses in Denton Holme under the Housing of the Working Classes Act, estimated to cost £10,684, an increase of £2,300 on the original estimate.

Dundee.—The following plans and sections of proposed new buildings, etc., in Dundee have been lodged at the office of the City Engineer:—Clepington-road (west), shed for Messrs. P. D. Mitchell, Ltd.; Crescent-street, extension of school for Dundee School Board; Dundonald-street, warehouse for Messrs. Malcolm, Ogilvie, & Co., Ltd.; Navarre-street, Barnhill, cottage for Messrs. James Tullis & Sons.

Dunfermline.—The District Committee has approved amended plan submitted by Mr. Gilbert T. Scott, architect, Inverkeithing, on behalf of the Hill of Beath Tavern Society, Ltd.; also plans submitted by Messrs. Smith & Watt, North Queensferry, showing proposed erection of temporary office at Ferrybarns.

Finchley.—Plans passed by the D.C.:—Revised junction of Addison-way and North-way, east of Eastholm, Addison-way, Co-Partnership Tenants, Ltd.; temporary buildings—Long-lane, near junction with Squires-lane, Mr. F. Fear; 2, Leopold-road, Mr. A. W. Cattle; Crescent-road, G.N.R. goods yard, Messrs. Eastwood & Co.; rear of Grand Hall, North Finchley, Ashby's New Halls; 53, Clifton-road, Mr. M. Groom; "The Laurels," High-road, North Finchley, De Dion Bouton, Ltd.; 22, Woodberry-grove, Mr. R. Ellwood.

Glasgow.—The following linings have been recently granted at Glasgow Dean of Guild Court:—Messrs. A. L. Meteorlite, Ltd., 106, Victoria-street, London, to erect a workshop at North Craigpark-street and Alexandra-parade; the Caledonian Railway Company, to convert existing booking office into a dwelling-house at Crow-road Station, Clarence-drive; Messrs. William Beardmore & Co., Ltd., to erect dining-rooms at Old Edinburgh-road; Messrs. Mechans, Ltd., Scotstoun Ironworks, Scotstoun, to erect a shed at their works in South-street and Balmoral-street.

Haynes.—The Beds. C.C. has accepted a tender for repairs to cottages, fences, gates, etc., at Haynes, for £44 15s. 6d.

Holmfirth.—The Council's Surveyor has received a plan of proposed new buildings at Kirkroyds, for Messrs. J. Holmes & Son.

Horbury.—The D.C. has approved plans of additional storage sheds at Horbury Bridge, for Messrs. J. Reid & Son, oil works; motor shed at Calder-grove, for Messrs. C. Marsden & Son, paper works; and of an electrical sub-station at Horbury Bridge, for Messrs. Elwand Smith & Co., mungo manufacturers.

India.—The scheme submitted by the Commissioners of the Howrah Municipality for providing drainage to a portion of that municipality has been approved by the Governor-in-Council.

London.—An application made, with plans, for the consent of the justices for the licensee of The Fountain, Mile End-road, to be allowed to carry out certain alterations has been granted. Application to alter the beerhouse, 79, Kirbey-street, Bromley, has been acceded to by the licensing justices.

Loughborough.—The T.C. has passed the following plans:—Coalhouse and stores, Knightthorpe-road, for the Primitive Methodist trustees; yarn shed, Rendell-street, for Messrs. H. E. Godkin & Co., Ltd.

Luton.—The T.C. has approved the following plans:—Four houses, Cavendish-road, Mr. F. Thomas; warehouse, Bury Park-road, Mr. W. J. Bolton; additions, Biscot-road, Commercial Cars, Ltd.

Lydney.—Plans for alterations of a villa at Woolaston, for Mrs. Ann Hawkins, have been approved by the R.D.C.

Macduff.—At a recent meeting of the T.C. a plan for a new motor garage, for Mr. J. T. Wilson, Manner-street, was remitted to the Plans Committee.

Madras.—Plans are ready for the construction of the new aquarium on the Marina on the site now occupied by the Lady Wenlock Park, Madras.

Marsden.—The New Buildings Committee of the U.D.C. has referred the plan submitted by Mr. Albert Schofield showing proposed conversion of stables into cottages to the Finance and General Purposes Committee.

Musselburgh.—Plans have been passed by Musselburgh Dean of Guild Court for the erection of a picture house immediately adjoining the Musselburgh United Free High Church to accommodate 1,054 persons. The promoters are the Central Picture House, Musselburgh, Company, Ltd., 104, West George-street, Glasgow.

Oldbury.—The U.D.C. has passed the following building plan:—Messrs. Shotton Bros., offices, Manchester-street.

Penzance.—The T.C. has accepted a tender for the building of the wall and making-up the new road, etc., to the new houses in connection with the housing scheme, at £167 11s. 6d.

Richmond (Yorks).—The T.C. has passed plans for the proposed lavatory in the Friary Grounds, and has given authority to the Executive Committee to carry out the work.

Shanklin.—The U.D.C. has approved a plan of alterations of a shop front in Shaftesbury-buildings, for Mr. R. Warder.

Sheffield.—An application is to be made by the Sheffield City Council for authority to prepare a "town plan" in respect of 142 acres of land comprising the area between the Eccleshall end of Psalter-lane, Nether Edge, and Brincliffe.

Silsden.—The U.D.C. has approved the plan of Mr. T. Green's sheep dipping shed at Brunthwaite; also the plan of the Silsden Dyeing Company for petrol store.

Skelmanthorpe.—The D.C. has passed plans submitted by the executors of the late Mr. John Senior for the conversion of a shop into a dwelling-house; also plans of a washhouse submitted by Mr. Outram in Spencer-street.

Spain.—Royal Assent has been given to the proposals of the "Dirección General de Obras Públicas" for the distribution of the sum of 9,000,000 pesetas (about £360,000) among the various provincial authorities in Spain, with a view to carrying out, by contract, necessary road improvement works during the current year.

Stafford.—On the recommendation of the Electricity Committee, the T.C. has agreed to make application to the L.G.B. for their sanction to the raising of £12,000 for extensions to the electricity works.

Stokesley.—The R.D.C. has approved of a plan from Mr. M. Dodds of two dwelling-houses proposed to be built in Kirby-lane, Great Broughton.

Sutton-in-Ashfield.—At a recent meeting of the U.D.C. the following plan was recommended to be passed:—Stable, washhouse, etc., in Fox-street, for Mr. Arthur Searson.

Swindon.—The following plans have been approved by the T.C.:—Messrs. F. & T. Affleck, lavatories, Prospect Works; Messrs. Bridgman & Bridgman, reconstruction of premises for Messrs. Lennards, Ltd., 80, Regent-street; Mr. A. Mortimer, rebuilding and extending shed, Rayfield-grove; Messrs. Green & Marsh, brick shed, rear of 21, Commercial-road.

Teesdale.—The L.G.B. has approved the proposal of the Guardians to allow a strip of the Workhouse ground to be given to the U.C. of Barnard Castle for the widening of the road.

Watford.—Plans approved by the U.D.C.:—For alteration to Derby House, High-street; for three houses in Sussex-road, for Mr. Weller; new store for Messrs. W. & D. Wilkins, attached to proposed fish shop, Queen's-avenue.

West Lancashire.—Plans of proposed sewage purification works, Bartlett Home for Epileptics, Maghull, and of proposed workshop, Guide-road, Hesketh Bank, for Mr. George Dawson, have been approved by the Council.

Weston-super-Mare.—The Burial Board Committee of the U.D.C. has considered the proposals of the Surveyor for laying out the lands acquired for burial purposes, and have instructed him to proceed with the preparation of the plans accordingly.

* War bonus of 2s. per week granted.

List of Competitions, Contracts, etc.

For some contracts still open, but not included in this List, see previous issues. **Those with an asterisk *) are advertised in this number:** Competitions, —; Contracts, iv., vi., viii.; Public Appointments, xviii.; Auction Sales, xx. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

⁂ It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Contracts.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to THE BUILDER LTD., and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

NEW COMPANIES.

THE undermentioned particulars of new companies recently registered are taken from the Daily Register compiled by Messrs. Jordan & Sons, Ltd., Company Registration Agents, Chancery-lane, W.C.:—

J. M. DARTOIS & Co., LTD. (142,716). Registered January 14. To carry on business of iron and steel and general metal merchants, flat and plain steel, iron, holloware, steel constructions, agents for and dealers in all descriptions of goods made from iron or steel, dealers in all munitions of war, brick, tile, and chimney manufacturers, builders, etc. Nominal capital, £10,000 in 800 "A" shares of £10 each and 40,000 1s. "B" shares.

MACMULDROW & Co., LTD. (142,779), 168, London-road, Liverpool. Registered January 20. To purchase or otherwise acquire business of timber merchant, sawing and turning mill proprietor, packing-case manufacturer, carried on by Peter Macmuldrow, Liverpool, as Macmuldrow & Co., and to carry on business of house furnishers and furniture removers, builders, contractors, mechanical, electrical and civil engineers, land, estate and house agents. Nominal capital, £6,000 in 6,000 £1 shares.

Austrian
RUSSIAN and JAPANESE
PRIME DRY
WAINSCOT Oak
SYDNEY PRIDAY,
KING WILLIAM HOUSE, 2a, EASTCHEAP, LONDON, E.C.
Depot: Wainscot Sheds, Millwall, E. *T.N.: Avenue 667.*

A. OLBY & SON, LTD. (142,819), 167–169, Beckenham-road, Penge, Kent. Registered January 25. To carry on business of builders, merchants, wholesale and retail ironmongers, timber merchants, dealers in all builders' requisites, ironfounders, engineers, brass founders, mechanical, hydraulic and electrical engineers, painters, house and estate agents, etc. Nominal capital, £6,000 in 6,000 £1 shares.

BRAZIER & SON, LTD. (142,833), 41, London-road, Southampton. Registered January 26. To acquire, take over, and carry on business of builders, contractors, brickmakers, now carried on at above address by W. P. D. Brazier and elsewhere as Brazier & Son, decorators and furnishers, house and estate agents, engineers, miners, and stone cutters, iron and steel smelters, and to deal in building material of all kinds. Nominal capital, £7,000 in 7,000 £1 shares.

LOVE & Co., BUILDERS, LTD. (142,824), 34–5, Exeter-street, Strand, W.C. Registered January 25. Nature of business indicated by title. Nominal capital, £4,000 in 4,000 £1 Ordinary shares.

EKACERTIN, LTD. (142,785), 1, Austin Friars, E.C. Registered January 21. To acquire, take over, and construct machinery and plant or rights and licences in relation to machinery, plant, processes, and inventions, and carry on the business of general manufacturers and merchants, brokers, contractors, shippers, builders, etc. Nominal capital, £5,000 in 4,000 £1 Preference shares and 20,000 1s. Deferred shares.

THE BUILDER

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

OL. CX.—No. 3812. FEBRUARY 25, 1916.

NORTH AND SOUTH.

IN his recent work on "Form and Colour" Mr. March Phillipps describes the main divisions into which architectural art falls as Eastern and Western, advancing arguments and giving illustrations to prove that the one is mainly and primarily concerned with form and other with colour. He seems to have overlooked the fact the geographic areas might with greater reason be described North and South, for what we describe as being Eastern ns are, without exception, characteristic of the South, while stern forms can be as truly defined as Northern. The one nition carries with it the recognition of the existence of ain fundamental differences of climate and therefore of ; the other is purely arbitrary. North and South also espond to certain date limits in the history of civilisation ch have less meaning as applied to East and West. The y civilisations arose in countries where the conditions of were easiest and the fertility of the soil offered fewest tacles to the accumulation of wealth. Such conditions were nd pre-eminently in the valleys of the Nile, the Tigris, and hrates, and perhaps in the alluvial plains watered by great slow-moving rivers of China, and it is therefore these regions that the first chapters in the history of lisation were written, thus affording proof of the all-ortant bearing of climate and physical conditions on the ory of architecture.

In the close jungle-covered countries of South-Eastern a, and in the corresponding wilds of Central America Yucatan, there are records of early civilisations; but, ure being more fierce and difficult to deal with, these rds have left fewer traces in past architecture. If we sue the parallel a little further we shall see that even in ope these apparent differences between the architecture of ious countries have been strongly influenced by climatic siderations produced by natural features, which often tly neutralise or vary the influences of geographical latitude. barrier of the Alps sharply separated Italy from the ns of Central Europe, no less than the long dominance of ne in Italy produced conditions which immediately began cause the differentiation of mediæval art in Italy from that he remainder of Europe; while in corresponding latitudes Spain no such marked differences exist, the greater part Spain consisting of high and arid tablelands, in which cold ters and other northern conditions exist, in spite of the ater altitude of the sun. And in mediæval Spain, most which was for long under the Government of an Eastern e, we find the counterpart of the Gothic of the North, h marked local characteristics, it is true, such as internal tresses and the introduction of the *cimborio*, but still Gothic, ch is utterly unlike the distinctive type of mediæval work duced in Italy. In Spain it is only when we are southward the central plateau that we find Northern influences gely obliterated in the fertile valleys stretching down to Mediterranean Sea. Nor can these differences be wholly ounted for by the longer period of Moorish rule in Southern in, for clearly in a large measure they are the result of the erent influences of Northern and Southern conditions on habits and wants of mankind.

Just as Italy has been isolated from the North by a barrier mountains which abruptly mark the transition from North South, a change expressed in the different architectural racter of its buildings, so to an even greater extent has lia been cut off from Central Asia by the most stupendous in of mountains in the world, on one side of which is the at plateau of Tibet and Turkestan, on the other the water-d of the Ganges and the Indus, which flow through heated plains to reach the tropic seas. North of the Himalayas the architectural type is Tartar-Byzantine or Russian and Chinese; while to the South we have the various developments of Hindu architecture, all distinct variants of a Southern theme. Even the Muhammedan conquerors of India, whose invading troops poured through the passes from the north-west and whose Dynasty ruled in Delhi, quickly absorbed what was Southern and most indigenous to the Indian peninsula, and Moghul art became more Indian in character than Saracenic.

We do not assume that the expression "North and South" explains and accounts for different forms of art, as we are led by Mr. March Phillipps to think that "East" and "West" define them. There is the influence of race, and we should expect a different development among the intellectually inquisitive Greek and the contemplative Hindu, or the masterful Roman, determined to reduce the mundane matters of life to system and order.

But we do assert that throughout the South, whether in East or West, certain broad characteristics obtain—characteristics which are determined by latitude rather than longitude. In the South we have the love for external display, the prevalence of the horizontal line, a sense of amplitude of space; and in the North the striving for security and protection, the cultivation of architecture as a means of the production of interior spaces, the steep roof and more broken outlines due to the effect of climate.

Across the thread of æsthetic tradition moves the shuttle of great world developments, like that of Christianity, which entailed a common ritual and a form of building suited to that ritual and to its traditions on North and South alike, and the great movement of the Renaissance which, spreading from its birthplace in Italy, set up a common standard of form for the civilisation of the day; and, lastly, modern science annihilating the effects of distance and using wealth and the resources of science without regard for the dividing lines of nationality and race. Yet we know beneath the cosmopolitan influence of these unifying tendencies natural architecture can only rise to its greatest pitch of excellence when we can say of it that it indicates a just sense of its position as regards North and South. Palladio's Basilica at Vicenza would be an anachronism in an English town, nor would the Banqueting Hall in Whitehall please us in Italian surroundings; while St. George's Hall at Liverpool is a magnificently audacious but unsuccessful effort to ignore conditions of time and place.

And the British Museum marks a further incursion into the domains of unfeeling pedantry in art. The difficulty which faces the designer is that to do good work he must obtain knowledge, but that in obtaining what he needs he may wander enchanted with the treasures of the past, missing the eternal truth that all he can learn must be used with reservations, and that the most important of the limitations set is the eternal barrier of latitude.

To produce the best work it is necessary to be guided by the results of the workers in the days of tradition, which implied the gradual adoption of what was suitable and consistent in each locality; so if we are able, out of the funds of a greater knowledge of the past, to do this intellectually rather than mechanically, the store-house of knowledge opened up to us will be an aid and not a deterrent to the production of suitable design. But if we ransack its treasures greedily and without judgment we shall be pitiful mummers dressed in the garments of past ages—what we produce will be a travesty of the past unsuitable to clothe the present, and we shall probably find we have overlooked the eternal distinctions conveyed by the terms North and South.

NOTES.

Liverpool Cathedral.

Liverpool Cathedral is naturally being proceeded with more slowly than in normal times, Dr. Chavasse having stated the three possible courses which might be adopted, as follows:—First, to raise the sum of £40,000 to complete the choir and central space by midsummer of next year; secondly, to stop building altogether; and, thirdly, to invite generous churchmen to subscribe the sum of £13,000 to complete and safeguard the shell of the building; and the Bishop thinks the third the only wise and practicable policy, in which we consider he is justified. We are glad to hear that the response to his appeal has been so generous that in a few weeks £8,000 has been subscribed, so that £5,000 alone remains to be found. We trust it will not be very many months before Dr. Chavasse is able to appeal for funds to complete the building which has appealed so successfully to the imagination of the inhabitants of Liverpool, for the completion of the greatest English cathedral of modern times would form a fitting memorial to the historic events of the present war, to which Liverpool and Lancashire have contributed so large a quota of men in the fighting line, and men and women workers for the large army of munition workers on whose efforts the outcome of the war so largely depends. The response of the great industrial centres to the call of patriotism has been one of the finest incidents in the present colossal struggle.

A Hindu University.

One of the last of Lord Hardinge's acts as Viceroy has been the laying of the foundation-stone of a new University at Benares which is to cost the equivalent of £2,000,000, of which about a third has been already subscribed. It is the first Indian University promoted and founded by non-official agencies, and will be the first to impart religious instruction. The site is the gift of the Maharajah of Benares, and, with the exception of Mrs. Annie Besant, Indian effort alone is responsible for the foundation of the University, the internal management of which will be left in native hands, while the Government only retains some powers to prevent mishaps. We are glad to record the new departure which indicates the wish of those in authority to encourage the development of Hinduism along its natural lines, trusting to higher education to bring community of aims between European and Hindu, each arriving at the same end by different means suitable to their respective races; for, though fusion between East and West is impossible, parallel development along different lines will bring greater mutual understanding in its train. We shall be interested to learn in what manner this, the first great Hindu educational building of modern times, will be expressed, and whether we shall see a version of the vernacular or a species of new development like that instituted at the new Delhi.

An Objectionable Advertisement.

Our attention has been called to what may be described as a very objectionable form of advertisement which has appeared in the daily Press:—"Ladies and gentlemen of good social position who have personal influence with architects and surveyors who are about to erect new buildings can add substantially to their income. Apply by letter to ———" In the reply sent to an inquirer the firm in question, who are constructional engineers, state that they will be glad to pay 5 per cent. on the value of any work introduced, but are not keen to enter into competition with other firms for this class of work, because, "as we make a very special feature of promptness of delivery and completion, we are not the cheapest firm in the market." We think the advertisement appeals to an objectionable element, as the "ladies and gentlemen of good social position" are presumably without the special knowledge which would enable them to recommend the firm's work on its merits, and the presumption is that "social influence" is to be employed in a manner which, if commonly practised, would lead to the wholesale degradation of society.

Quantities in America.

We have before us an American circular entitled "A Word to the Advocates of the Quantity System," to which is pinned a copy of a circular addressed to the Fellows and Members of the American Institute of Architects by Mr. G. Alexander Wright, of San Francisco. The two documents read somewhat quaintly, and from them we gather that the recent attempt to introduce the quantity surveyor to the Western world is somewhat hampered by ignorance of the nature of his task, otherwise such clauses as the following would hardly be required:—

> These quantities, and improperly so, force the bidder to refer back to the drawings and specifications before he can determine his itemised cost values. All information necessary to determine items of cost and quantity should appear in the quantities. To give this is clearly duty of the quantity surveyor. His fee covers this service.
>
> The suggested protection against incorrect quantities by a su company bond becomes a doubtful issue if the quantities contain cove clauses capable of being so construed in a court of law as to pro the parties who prepared the quantities, and necessarily their bid company also. Architects who have had experience following a with the attorneys for a bondsman, will realise what they might exp when the language of the quantities makes it obligatory upon a bid before bidding, to examine all the drawings and specifications (wit view, of course, to his including every cost in his bid). There is a condit a loophole, here which should not be.

Although it is difficult to imagine what architects here would without quantities, it seems certain that, if American archit require the information which Mr. Wright gives, they can have li idea of the real object of the use of quantities and of their nat It seems an anomaly that in America, where the processes of are "speeded up," the builder should have time to take out own quantities from architects' drawings as was the case here ye ago, when pupils and assistants laboured over the production numberless tracings to enable competing builders to take out t quantities from. We should like to know whether the Ameri contractor has special methods of estimating.

Greek Art.

Professor Harrower recently delivered a lect on the "Unity of Greek Art" at the Aberd Architectural Association, in the course of which stated that anyone desirous of illustrating all the unifying influer of the art of the Greeks would naturally choose sculpture, but s characteristics were presented even more clearly in their architect such as clarity, lucidity, balance, simplicity, harmony and proporti as well as strong conservatism, organic growth, and the discoura ment of chaotic individualism, and, above all, the appeal to se and intellect rather than to emotion. All these qualities were to found in Greek literature, and it was not too much to say that fundamental principles of Sophoclean tragedy took concrete form the Parthenon. Greek theorists did not regard architecture as of the fine arts, for it was not mimetic and did not represent a thing, least of all that which the Greeks considered as the pro object of artistic representation, the human form and the hun spirit. Plato united architecture with music as possessing an ethi value and influence. It was a common Greek belief that a m could ruin himself body and soul by bad music as surely as drunkenness or any other vice. Professor Harrower went on to that he himself was insensitive to architecture, and if any archit chose to put two hopelessly degraded copies of the Choragic monum of Lysicrates one above the other to form a tower, he did not gn his teeth, but supposed it was Classic and right! Not the le entertaining suggestion of a clever paper was the reference to Andrew Carnegie, who said they would not find one ennobling thou in Homer's barbarisms. "This criticism," the Professor sa "should be listened to with the respect due to Mr. Carnegie's w known critical eminence and fine literary taste." Such address though they convey little fact, are useful and illuminating to architectural student, showing as they do the range of mental ima which is only possessed by those whose education is not bound by the limits of their calling.

The British Industries Fair.

The British Industries Fair is being held at Victoria and Albert Museum from February 21 March 3, and in order to avoid interference with production of munitions of war the exhibits t year are limited to printing and stationery, earth ware and glass, fancy goods and toys. About 100,000 invitati have been issued by the Board of Trade to wholesale buyers h and abroad. The greater part of the ground floor of the Muse has been cleared of its permanent collections to make room for Fair. It is believed that one of the most interesting and use features of this year's Fair is the inclusion of exhibits of spe mens of articles which the Germans have hitherto supplied in la quantities for this country and for oversea markets. The Board Trade express themselves as being pleased to see that manufactur as a whole are keenly alive to the new opportunities open to th and mean to make use of them. We, too, are glad that this shou be so, and hope that those in authority will assist as they can efforts of private firms to increase national trade. British tra has been created by private enterprise, and has had to fight its w in the teeth of foreign State-aided competition, scientifically organis and helped. Our consuls—supposed to look after British interests are largely foreigners; our Government, giving every rival free acc to our markets, has been denied favourable terms in those of rivals, and the British merchant alone has had no organised help rely on in his difficulties. We should much like to know that all t will be changed when peace comes, and that the interests of o own people will not be sacrificed because of the altruism or indifferen of our Government.

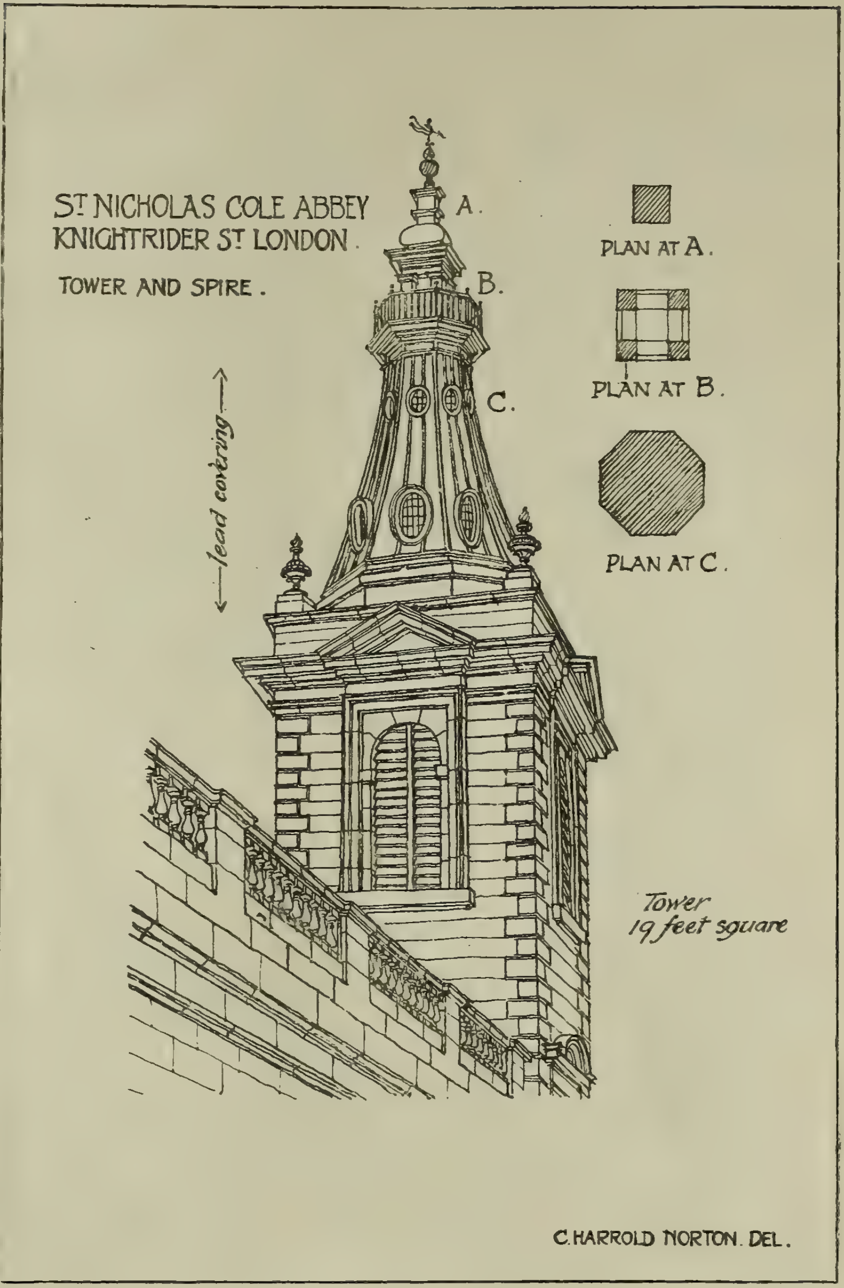
: LONDON CHURCHES F WREN AND LATER RCHITECTS OF THE ENAISSANCE.

o. XV.—St. Nicholas Cole Abbey.

Church of St. Nicholas Cole Abbey
on a site between Knightrider-street
ueen Victoria-street, its chief approach
from the last-named street up a flight
ps, but the principal elevation is to
rider-street, on which the tower fronts.
resent church serves the parishes of
cholas Olave, St. Mary Mounthaw, and
ter's, Paul's Wharf, which were not
after the Fire; St. Mary Somerset,
was pulled down in 1871, with the
on of the tower; and St. Benet, Paul's
now used for extra-parochial purposes
Welsh church. The advowson of the
benefices is now in the hands of the
nd Chapter of St. Paul's.

present church was completed in 1677
st of £5,500, and replaces an older church
ed in the Fire. The designation "Cole
" is probably a corruption of St.
s Colby, and refers to a founder or
.

church shows less trace of classical
ce than most of Wren's designs, and is
by great simplicity and freedom of
g. The steeple is particularly pleasing,
ce that of St. Edward King and Martyr
nbard-street, rather suggests Flemish
ce in its bold and picturesque outlines
tails. The proportions of the north
with its simple range of windows,
ade, and cornice, are very pleasing.



The church contains a fine screen across the west end, with good door-cases, and a modern organ over, a fine pulpit, and an interesting altar-piece. Gold has been used internally in a very happy manner, and the church, though unusually secular in appearance even for a building of the epoch, is both rich and pleasing in effect. The north wall is broken by a range of windows affording ample light; the corresponding blank wall on the southern side is covered with ornaments and memorials of considerable interest. The ceiling is flat and formed of beams with pendants at their intersection. The interior shows to full advantage, as it is in a good state of preservation and carefully decorated.

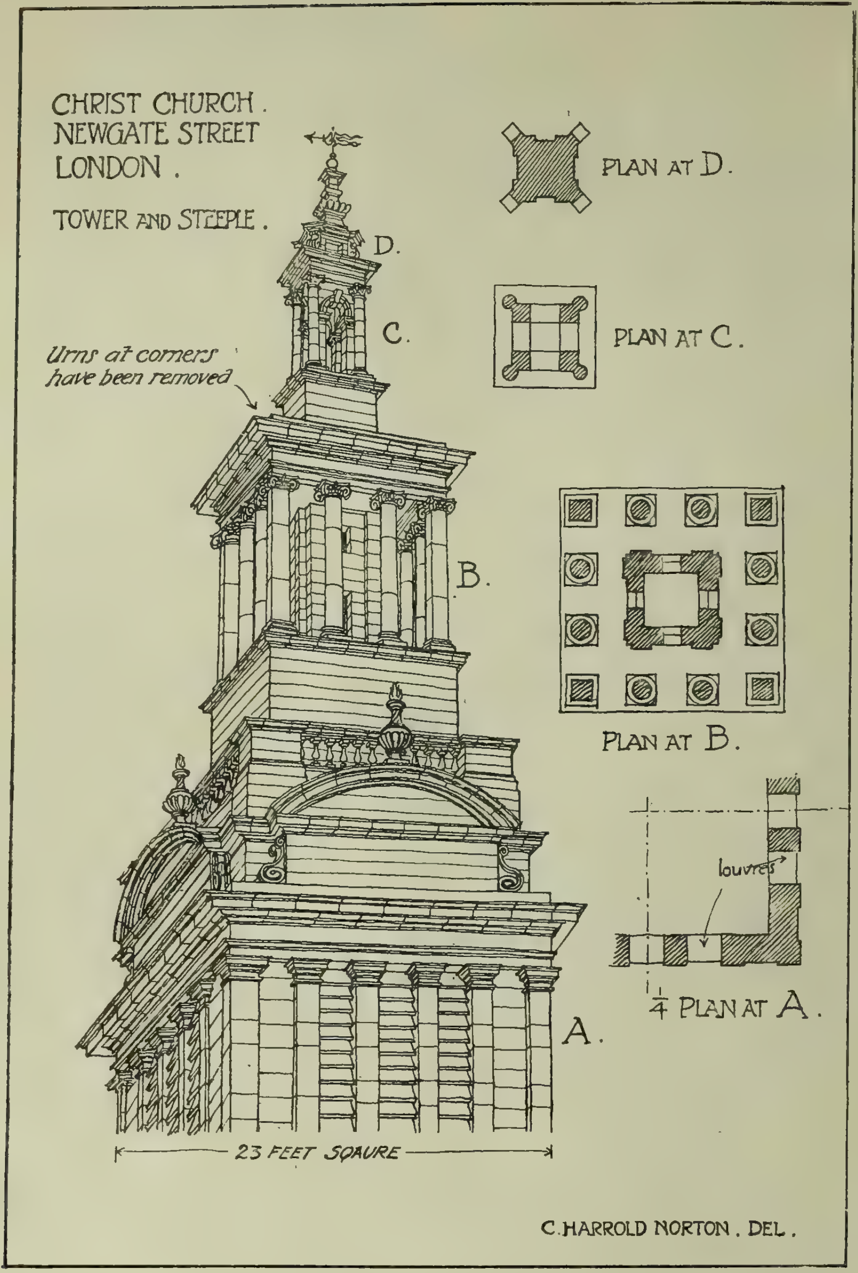
No. XVI.—Christ Church, Newgate.

Christ Church, Newgate, stands to the north of Newgate-street, and occupies about half of the area of an ancient Franciscan church. A church and monastic buildings were erected on the site, which were replaced by a greater building, the choir of which was commenced by Queen Margaret, the second wife of Edward I. This church of Gray Friars was consecrated in 1325, and measured 300 ft. in length by 89 ft. in breadth.

Stow states that the parishes of St. Nicholas and St. Ewin and so much of St. Sepulchre's parish as is within Newgate were made one parish church in the Gray Friars' Church and called Christ Church, founded by Henry VIII. The conventual buildings were adapted to charitable purposes. The old church perished in the Fire, the present church being built in 1687 and the steeple added in 1704. The chief interest of the church, the largest of all Wren's London churches, is the treatment of the wide west front and steeple, the successive stages of which are all square and unusually abruptly diminished in size. The projection of the tower, which is entirely outside the body of the church, cuts the west front into three defined sections. Though the detail is less refined and careful than that of many contemporary works, the whole effect is full of character and interest. The interior, on the other hand, though striking from its dimensions, is commonplace in design and detail, and much spoiled by the steep rake of the side galleries, which were reserved for the use of the boys of the Blue Coat School. The east end contains the group of windows which compare so unfavourably with the large traceried window of a mediæval church, and which are usually better omitted where exigencies of light do not necessitate their introduction. In the church "the Spital Sermon" is preached annually on Easter Tuesday, and attended in state by the Lord Mayor, sheriffs, and aldermen. This sermon was formerly preached at the cross in the Spital (Spitalfields), and afterwards at St.

[Photo.: Geo. Trotman.

St. Mary Somerset.



Bride's until 1797, after which date it was preached at Christ Church.

With Christ Church is united the parish of St. Leonard, Foster-lane, which was not rebuilt after the Fire, and the presentation is made alternately by the governors of St. Bartholomew's Hospital for Christ Church and the Dean and Chapter of Westminster for St. Leonard's.

There are a number of monuments of interest in the church, the most interesting artistically being two in the entrance vestibule, while under the tower are several tablets removed from Christ's Hospital.

Christ Church is not among Wren's most successful efforts, and bears too great a resemblance in design to some of the larger churches of later and less interesting epochs of the Renaissance, but it stands on a site which recalls many historic memories and traditions.

◆

MUNICIPAL OFFICES, SPENNYMOOR.

The new municipal building of the Spennymoor Urban Council was opened recently. The building comprises a Town Hall and Market Hall adjoining. The Market Hall is 141 ft. long, 39 ft. wide, and 16 ft. high, whilst the Town Hall is 84 ft. long and 40 ft. wide, with seating accommodation for 850 persons. There are also the council chamber and offices. The contractor was Mr. J. Miller, of South Shields, and Mr. Wellburn was the architect.

ARCHITECTURAL SOCIETIES.

Birmingham Architectural Association : Flemish Art of the Middle Ages.

Before the members of the Birmingham Architectural Association, on the 18th inst., Mr. J. A. Swan, F.R.I.B.A., lectured on Flemish Art of the Middle Ages as reflected in the incomparable public buildings which the Germans during the past eighteen months have laid in ruins. Flemish art, it was said, borrowed much from the German and French, but he held it undoubtedly indigenous. For its true character they must search the record of the great towns. In spite of the strong German and French influence there was a great unity of expression, whether in architecture, painting, sculpture, or the allied arts, Gothic or Renaissance. They were much imbued with the spirit of romanticism. It would not be too much to say that the countries closest in contact with the Netherlands were infected with this exuberant vitality. They took it to themselves, and our own country owed an immense debt to Flemish art in the Elizabethan and Jacobean periods. In architecture the best of the Flemish work was built for secular rather than ecclesiastical use. Bruges, Ghent, Antwerp, Malines, Brussels, Louvain, and Ypres provided a magnificent series of town halls, cloth halls, belfries, and guild houses. Ypres, which held much beautiful Flemish work, was now a tragedy in stone. But
magnificent work there had been there!
familiar Cloth Hall and Hôtel de Ville

Glasgow Institute of Architects.

A quarterly general meeting of the Gla
Institute of Architects was held on the
inst. at the rooms, 39, Elmbank-cres
Glasgow, Mr. John Watson, F.R.I.
President, in the chair. It was reported
the President had been appointed as ass
from the Institute on the examining ju
the Glasgow School of Architecture in roo
Colonel J. B. Wilson, whose term of
had expired. The meeting took into
sideration the regulations for contracts
building works in Scotland which were i
recently by Sir G. R. Askwith, and
were fully discussed, and explanations
given regarding certain of the articles.
proposals of the Library and Educ
Committee with regard to student men
of the Institute were brought before
meeting and approved of.

The Architectural Association of Irelan "Round About the Adriatic."

Mr. Harold G. Leask, President, occupie
chair at a meeting of the Architectural As
tion of Ireland, Dublin, on the 10th inst.,
Mr. J. White delivered a lecture en
"Round About the Adriatic." In the c
of his lecture, which was illustrated by la
slides, Mr. White described Corfu and the fa
forts of the Adriatic coast. He convey
audience to Trieste, and showed views o
great caves of Adelsburg, extending for
beneath the mountains. Crossing to Ver
number of picturesque views were sh
including St. Mark's. The lecturer gave d

CORRESPONDENCE.

Architects and Public Services.

SIR,—Your published list of authenti
cases of waste and mismanagement in all
of building work connected with the
presents one aspect only of a state of
the serious nature of which does not
even yet to be quite realised by those
position to remedy it.

From your columns we learn of was
money, materials, and labour—with conse
loss of national efficiency—caused to a
large extent by the lack of competent org
tion and supervision of building operatio

From another point of view we see the
majority of the members of a prof
specially trained for this very work sta
idle because their usual work has been st
by the Government, whereby the countr
been deprived of their expert services
matter having a direct bearing on the succ
prosecution of the war.

Taken singly, either of these aspects
possibly be looked upon as an unavoi
misfortune; taken together, they constit
scandal which can and should be avoided.

In spite of repeated representations
by those entitled to speak on behalf o

---

* See our last issue, page 147, North-W
Federation Report.—ED.

sion, the Government appears to have no official and systematic attempt to y architects in their war buildings, not those architects whose work has been d by direct Government action.

at has been the Government attitude ds those who might be said to have a l claim on the country?

you are aware, the Architects' War ittee has collected funds to provide yment for those badly hit by the war, the Government Committee for the ntion and Relief of Distress, by means National Relief Fund, repay from time e about one-half of the amount spent in by the Architects' War Committee. overnment Committee is also paying the nely small salaries of a number of ects who are engaged on civic survey es in approved areas. This action has ubt been of considerable assistance to rofession, but it is to be noted that the used in this way are not Government but moneys definitely subscribed for ses of relief.

en, however, the need arises for more for the munition factories and other war what happens?

at I suppose might be described as semi-l hints or suggestions are conveyed to Architects' War Committee that relief d not be granted to applicants who r eligible for work in munition factories. eems to have occurred to the Government he Government Committee that there is nse in providing useless work for those f employment when there is useful work ng for them, but it does not seem to have red to either of these august bodies that est way to make use of an architect is to him on work for which he has been ally trained, and not upon work for which s not been trained, and for which he has ecial aptitude when he has been trained.

space permit I could give you a dozen ns why the average middle-aged architect t likely to develop into even an average tions worker, however long you train him. hole past life is against it.

there were none of his own special work ng for him, his use even as an indifferent tions worker would no doubt be justified; here is special work waiting for him, as ave all known since the beginning of the nd as your columns now testify.

is time that this matter was put in order. ggest that instead of putting pressure istressed architects to force them into tion factories, where they would be of ecial value to the State, the Government l put pressure on their own departments rce them to employ all such architects e suitable on the design and supervision ar buildings, where they would be of me value to the State at this supreme of its existence.

m aware, Sir, of individual cases where ects have been and are being properly yed, but I am also aware of many more in which competent men have failed to mployment. In this connection it would eresting to know how many members of rps of Royal Engineers are at the present nt engaged in connection with building tions for the various Government depart-.

conclusion, Sir, I respectfully venture to st that the Architects' War Committee est serve both their profession and their ry by continuing to help all architects re in difficulties caused by the war till time as the State sees fit to use their es to put an end to the scandalous position ed to in your columns.

Apprentices.

—I have followed with interest the s letters which have appeared in the r the last few weeks on the question of the of apprentices in the building trades, as me, while those letters have referred to trades, that the same conditions obtain in sections of the building industry. I know difficulty of obtaining apprentices in ry trades is exercising the minds of yers, but I had hoped some of your readers would have offered comment on this matter from the trade unionists' point of view. I may be wrong, but my impression is they seem to be ignored in letters referred to. This attitude of mind, I venture to assert, ignores the history of the controversies which have hovered round this question of apprenticeships. Further, it does not take cognisance of the tendency of the present time—*i.e.*, the increasing insistency on the part of organised labour to have a direct voice in matters pertaining to the industry in which it is related and forms an integral part.

Undoubtedly, the question of apprenticeship has to be faced. By all means use every effort to stimulate interest in it, but what those interested have to avoid is, in any attempts made to promote the object aimed at, not to arouse undue suspicion that such are prompted in the interests of employers or employed. There is great danger of running this risk unless some common understanding is arrived at between organised employers and operatives' unions. With this end in view I suggest it would be advantageous to all if joint deliberation and action were resolved upon.

If possible the mistakes of the past must be avoided. It will be found that a considerable amount of feeling resulted through the question of making provision to regulate the number of apprentices, the operatives aiming at this because they felt the employer was out to secure an unlimited number, with the object not so much to promote the real interest of the trade as to get an unlimited supply of labour. Once this situation arose it will be found the question of turning out efficient craftsmen who took a real pride in their calling became a secondary consideration. I am not concerned at the moment to apportion the blame, but to impress what in my opinion has occurred in the past, in the hope that any new effort made shall be the result of common action evolving from reasonable counsels; then I contend there is some hope in the future of producing a system embodying the best elements of all.

The scheme published in the *Builder* over the name of Mr. Costigan I am not prepared to comment upon at this juncture. There are one or two details which require consideration. The idea of the question forming part of our educational system appeals to me; but may I point out one important fact in this connection, viz., the branches of Federated Builders have local agreements with operatives' unions? In most of these provision is made regarding number of apprentices. If the Federated Builders father the scheme of the Builders' Institute, or any others which emanate from one interest in the building trade, what bearing will it have on the local rules in question? I venture to say the effect will be, if this course is pursued, that the operatives will have a suspicion that (most likely wrong) the employers are out to foist some principles into our educational system with a view to secure that unlimited supply of labour referred to. If I were a member of a public body and this scheme came before me, as a trade unionist I should not view it with that favour I should desire, because of its origin. There is not the slightest doubt trade unionists on public bodies would generally take up a similar attitude, hence the greater need for mutual understanding. I have at the time of writing no data to form a definite opinion, but the twelve or thirteen Metropolitan boroughs which favoured this scheme do not appear a good representation of the Metropolis.

There is one phase of this matter of apprenticeship which I hope will receive serious consideration. I refer to the importance from every point of view of the necessity for some measures to be taken to inculcate among our craftsmen a greater pride in their calling. Speaking of the old and at one time greatly respected trade of a stonemason, some of us view with deep regret the gradual deterioration in this regard. One reads of the care taken in ancient times to cultivate pride of craft. Can we look for a revival? What is the opinion of the architects and employers who are animated with something more in life than the pursuit of profit alone?

I know it is customary with many people when referring to this question of apprenticeship to speak in a disparaging manner of its product in modern times. It will be argued we are not producing the self-respecting skilled artisan of the past. I have heard it repeated that the modern mason is not up to the skilled workman of the past, and the deduction is drawn that the workman of the present period is to blame. I deny this statement of the case. The correct one is that, owing to the vicious environment in which the modern mason works, the tendency is to reduce him to a state where individuality is a minor quantity.

The reasons for this state of affairs are various. The elimination of the old employer who had direct contact with his employees, machinery, and keen competition among employers have created an atmosphere conducive to anything but respect for the trade to which they belong. This condition has reacted against the apprenticeship system in many ways. In one direction I have noticed a marked reduction in the number of masons, compared to a few years ago, who put their sons to the trade. Further, owing to the intensification of competition, that keen attention is not given to the apprentice which was the case in the past.

From what I gather the above condition of affairs obtains in most sections of the building trades. In pointing out some of the causes operating to the disadvantage of the apprentice system it is not with the intention of apportioning the blame to any particular interest, but rather an attack upon a system; also a friendly criticism of the policy being followed as indicated in the letters previously published in your columns. S. STRANKS

(Organiser, Operative Stonemasons' Society, South Eastern District).

Should Art Be Artless?

SIR,—Mr. Alexander Pirie, writing under the above title in your last issue, catches at what he considers some inconsistencies in Mr. Francis Bond's review of Sir Thomas Jackson's recent book on Gothic. He thinks thereby to overthrow the theory, usually held, that architecture up to the Renaissance was a progressive growth and the men answerable for the buildings erected cared only for their own period.

They could, of course, afford to neglect all others, because they had a living art and were not " blown about by every wind of doctrine "; but we, working under different conditions and without their thorough belief in their work, cannot, and consequently we require such books as those of Sir Thomas Jackson.

When architecture was a living style it was carried on in much the same way as a scientific manufacture is now—say, shipbuilding; naval constructors study what is being done now and improve where they can. They have nothing to learn from the ships of Drake, Rodney, or Nelson. Anything of the nature of a revival is, of course, out of the question. Architecture had a big revival at the Renaissance. A type had become thoroughly established in England when a whole series of small revivals set in. Every few years there was an upheaval and a fresh start. Dame Architecture no longer dwells in her own freehold house, but takes one on lease, and then—often leaves before the term is up. Recently there was a brighter outlook. The English tradition, broken by the Gothic Revival, had been successfully picked up when a bombshell was dropped, and the present bald and barracky style introduced. Instead of the charm of the English school we have an uninteresting monotony. In a few years there will be a yearning for something with more human interest and some suggestion of the picturesque, and another Gothic Revival is far from impossible. If it comes there will be a great rush to Sir Thomas Jackson's book.

Until architects agree to adhere to one suitable type, until they are masters of it and can mould it to meet all modern requirements and new materials, we shall have no salvation. Architectural students will have to rush all through the centuries, devour the " list of recommended books," and use the energy which should be expended on actual work in merely accumulating material.

W. T. H. LEVERTON,
Licentiate R.I.B.A., M.C.I.

Wren's Churches.

SIR,—It is pleasant to read of the widespread interest shown in your illustrated articles. I cannot but think that an announcement that later on they will be republished in book form would be acceptable to many readers. Their reappearance would afford an opportunity for the inclusion of additional matter, and if promised soon might be the means of evoking valuable criticism on those already printed.

The suggested preparation of models for permanent exhibition in St. Paul's is a sound one, and will, I hope, be carried out.

WILMOT CORFIELD.

SIR,—I have often thought when looking at Wren's model of his first design for St. Paul's, which is now stowed away in a portion of the Cathedral to which the public are not generally admitted, that it should be placed in a museum where it could be properly seen and appreciated.

Mr. Lindley Latham's suggestion is an excellent one; but why not the London Museum, Lancaster House, or the Guildhall Museum in the City, which is devoted to the history of London? Perhaps room could be found in one of these museums, and if Mr. John B. Thorp, whose excellent models of Old London are now one of the features of the London Museum, could be engaged to model Wren's churches I am sure that the exhibition as a whole would not only be of considerable value to the architectural profession, but would be of surpassing interest to all lovers of this great architect's work, to which you are now again drawing attention in these times of stress in the admirable weekly articles on the subject.

BANISTER FLETCHER.

SIR,—Mr. Fredk. Nesbitt Kemp having mentioned my name in connection with the proposed models of Wren's churches, and suggested that anyone interested in this work should see my models of the Old City Gates, I am writing to say that they are on view at my studio, 98, Gray's Inn-road, any day between ten and twelve and three and four o'clock.

JOHN B. THORP.

Public Memorials.

SIR,—I have read with very much interest and pleasure the articles on the " Liverpool Memorials." Whilst they have very ably dealt with the subject from an architectural point of view, I venture to think it would have given the general reader additional interest if the inscription that appears on each memorial had been given. Perhaps this can be done in future articles.

I think the question of the placing of inscriptions on our public memorials is one that should be more generally considered, as I am of the opinion that the present system is much too meagre. The following is an incident:—

The "Joseph Cowen" statue at Newcastle-on-Tyne was unveiled just on the eve of the Royal visit to the city in 1906, and it was quite common to hear from the crowd that inspected it, " Who was he ? " The inscription only says, " Joseph Cowen, 1829–1900."

W. T. HAYLER.

Pre-War Contracts.

SIR,—In your issue for February 4 last you publish a long account of a meeting of the Federation in regard to " Pre-War Contracts." And as I am deeply involved myself in a contract of the nature, which I have now completed, I should be glad if you could assist me in some way to associate myself with the measures the Federation are adopting to bring the matter before the necessary authorities. Do you think I could do this, not being a member of any Federation of builders, as I would like for my own sake, and incidentally add to the evidence already acquired, to in some way bring my case before some other body. I have been very badly dealt with over a contract entered into in April, 1914, amounting to £18,000, on which I have lost £2,300 through the war, and the Council are in agreement that this is so, but decline to make me any allowance whatever, notwithstanding the fact that I was given a good many reasons during the war to believe that I should receive fair treatment at the end.

I have to say that this is the first contr that I have carried out of any size, and t it has swallowed up all my working capit which took ten years to get together, and a leaves me with a deficit that I cannot meet, a this means ruin and bankruptcy.

I therefore think that it is absolutely unf that a local authority should benefit in t manner to this extent and to an individual l of this nature. I am further advised lega that I have a good case to take to court, am unable to find the necessary money n to fight. H. T.

[*** We should advise the writer to co municate with the Federation of Mas Builders with a view to joining.—ED.]

Housing, Andover.

SIR,—I have read your interesting " Note. It is not a question of want of land, nor money. There is no doubt, as some of us w have houses are aware, that there is a v great demand. The items that block the w are scarcity of labour and cost of materials, a delay in getting materials when they ordered.

Railway companies are not always as acco modating as they might be. Trucks of materi are sometimes delayed for weeks, then seve are rushed in all at once, and if not clear demurrage is charged, and there is no redr for delay, which scarcely seems fair to builders merchants. Houses are good investments, a as soon as labour can be obtained there every probability that more will be bui Probably Andover is not the only town wh houses are required. COUNTRY BUILDER.

THE LONDON COUNTY COUNCIL.

THE usual fortnightly meeting of the Lond County Council was held on Tuesday in t County Hall, Spring-gardens, S.W., Mr. Cy Jackson, Chairman, presiding.

New County Hall.—In a Report submitt by the Establishment Committee, it was stat that a letter has been received from the Minist of Munitions of War, stating that the Minist of Munitions has found it necessary, in vie of the great shortage of labour for the co struction of munition factories, to give dire tions for the immediate discontinuance of t work now in progress at the new County Ha and that he has notified the contracto Messrs. Holland & Hannen & Cubitts, Lt accordingly.

Evelyn-street Depôt.—Accommodation f Trailer-Cars.—The Highways Committ recommended that tenders be invited fro selected firms for the execution of the wo in respect of the adaptation of the Evely street, Deptford, tramways depôt for t accommodation of trailer-cars.

The Geffrye Museum.—It has been arrange for the exhibition at the Geffrye Museum (*a*) the panelling removed from two rooms No. 8, New Inn; (*b*) a bronze coin mould foun in the excavations on the site of the old Gener Post Office, St. Martin's-le-Grand, believed be a forgery dating from the first century and (*c*) a plaster ornament from over the fro entrance to No. 17, North Side, Clapha Common.

Memorial.—It was reported that the memori to the late Sir W. S. Gilbert has been erecte on a pylon on the Victoria-embankment to t east of Charing Cross Pier, and the Loc Government Records and Museums Committ have made arrangements for its maintenance

Charing Cross Railway Bridge.—In reply questions asked by Mr. J. D. Gilbert, t Chairman of the Parliamentary Committee sa that that Committee had considered the pr posed insertion in the Bill promoted by t South-Eastern and Chatham and Dover Railwa Company of a clause dealing with the appea ance of the Charing Cross railway bridge, b had come to the conclusion that, as Parliame could not reasonably be expected at prese to force the company to incur expenditure that connection, the clause should not proceeded with.

ENERAL NEWS.

Steel Trade Amalgamation.

is stated that provisional arrangements just been completed for the purchase by rs. Pease & Partners, Ltd., Darlington, works and undertaking of the Teesbridge Company, Ltd., of Stockton-on-Tees.

R.I.B.A. Examinations.

e Council have given notice that the mediate and Final and Special Examina- will be held once only this year, viz., ntermediate from June 2 to 9; the Final Special from June 22 to 30. A notice ting the sending in of applications, ngs, and fees will appear in due course.

Guinness Trust Housing Scheme.

e report of the Guinness Trust for 1915 s that the capital amounts to £492,780. buildings continue to let well, the value e vacant tenements being under 1 per of the gross rental. On December 31 were 8,504 persons living in the Trust ings, 802 men, usually living in the ngs, being away serving in the forces. rustees have now provided 2,565 separate ings, containing 5,325 rooms, besides s' sheds and perambulator sheds. The ngs proposed to be erected on the ington Park-road site will be commenced n as conditions permit.

The London Fire Brigade.

Fire Brigade Committee, in a report to ondon County Council, submit statistics ve to the work of the brigade during 1915, comparisons for the preceding year. The s for last year include fires, deaths, etc., d by aircraft attacks :—

	1915.	1914.
.. .. ..	6,167	6,125
.. .. ..	3,595	3,509
ns fires	97	63
ney fires	645	557
ns caused through s, explosions, etc. ..	205	100
nated monetary loss sed by fires, explo- ns, etc.	£1,029,908	£555,750

Directory of British Manufacturers.

e Russo-British Trade Exchange, Ltd., of egent-street, W., send us a copy of a tory of British Manufactories for Russian , the first authentic directory of British facturers published in Russian, which is hed at 5s. It consists of about 400 , with trade headings in English and an, with a brief supplement entitled lights on Russia," by R. A. Lenski, ning statements of commercial facts g to Russia and other information. usso-British Trade Exchange, Ltd., also takes to furnish reports on the standing ssian firms and advertising in Russian ls, and to give expert advice on questions g to Russo-British trade. We think the ory should fill a present and future want s country.

Rebuilding in Belgium and France.

read that the Belgian Government have to Mr. J. J. Hill the task of reconstructing ilways and buildings in Belgium after ar, and that the French Government onstituted an inter-Ministerial Committee er to provide ways and means for re- ucting destroyed or damaged buildings ant. M. Revault, Deputy of the Meuse, ndertaken to frame a general scheme rations for the Committee of representa- f the Ministries of the Interior, Commerce, ndustry, Agriculture, Labour, Finance, Arts, Colonies, and War. As an initial I. Revault proposes to establish depart- workshops, to be subsidised by the for the making of models adapted to eeds of various trades and professions, e recommends that all children, from n to sixteen years of age, of refugees be at once taught the rudiments, at of the trades which they will hereafter on, and that thus a fresh supply of en should be set up.

"Harper's Magazine."

Harper's Magazine for February contains several interesting articles, including :—"Adrianople Between Wars," by Mr. H. G. Dwight, with photographic illustrations; and "The City's Ragged Edges," by Mr. Simeon Strunsky, with illustrations by Mr. W. J. Duncan, which deals with the transition of towns into cities.

Institute of Industry, Ltd.

The Institute of Industry (of Great Britain and Ireland) has appointed a Special Committee of its Court of Directors to meet representatives of important trade interests, with a view to considering suggestions having for their purpose the strengthening of the Court of Directors and the co-operation or amalgamation of other similar movements. The Committee appointed is as follows :—Mr. F. J. Nettlefold (Chairman); Sir Clifford J. Cory, Bart., M.P. (Messrs. Cory Bros. & Co. Ltd.); Sir James Heath, Bart. (Messrs. R. Heath & Sons, Ltd.); Mr. Godfrey C. Isaacs (Managing Director Marconi Wireless Telegraph Company, Ltd.); Mr. Frank Warner (President the Silk Association of Great Britain and Ireland).

Building Materials, etc., for Russia.

The British Vice-Consul at Moscow (Mr. E. B. St. Clair), in calling attention to the great demand that will arise in Russia after the war for manufactured goods of every description, points out that the following goods were formerly imported from Germany and Austria-Hungary on a large scale :—Building materials and requisites: Tiles, majolica, terra-cotta, locks, and sanitary goods and fittings. Machinery and tools: Power plants, pumps of every description, motor-cars and spare parts, etc. Scientific instruments, etc.: Astronomical, physical, drawing, and other scientific instruments. In this connection reference should be made to the Memorandum on the "Possibilities of British Trade with Russia," appearing on pp. 468–473 of the *Board of Trade Journal.*

The Relation of Sculpture to Architecture.

The Cambridge University Press will publish very shortly "The Relation of Sculpture to Architecture," by Mr. T. P. Bennett, A.R.I.B.A. English sculpture and English architecture have in the past fifty years been at a disadvantage owing to their unsuitable surroundings, and when used together they have often lacked the important quality of unity. The book contains 110 illustrations of buildings and monuments which show a successful combination of the plastic arts, and the result of the study of many others is added in the text. Sculpture in a variety of positions receives consideration, and the placing of monuments is discussed, besides sundry minor matters which are inseparable from monumental work. The pages of this volume will be found specially useful at the present time, in view of the discussion of the question of war memorials.

The Neglect of Science.

A memorial, presented by Mr. Arthur Acland, Chairman of the Executive Committee, and Sir Alfred Keogh, Rector (now acting as Director-General of the Army Medical Service), of the Imperial College, and Sir John Wolfe-Barry, Chairman of the Delegacy of the City and Guilds (Engineering) College, has been forwarded to Lord Crewe, Chairman of the Governors of the Imperial College :—The memorial supports the Memorandum on the neglect of science in this country which was signed by thirty-six eminent men of science and published on February 2 last, and points out that the Imperial College is directed by its charter to concentrate itself on "science in its application to industry and to give the highest specialised instruction and provide the fullest equipment for the most advanced training and research." It recalls as being true to-day a statement by the late Professor Huxley, that there was "hardly a branch of trade or of commerce which did not depend, more or less directly, upon some department or other of physical science, which did not involve, for its successful pursuit, reasoning from scientific data."

A Deceased Contractor's Estate.

Mr. James Archibald Ewart, of Old Queen-street, Westminster, and Beckenham, Kent, contractor, who died on November 23, has left estate to the gross value of £36,355, of which the net personalty amounts to £33,469.

An Architect's Bequests to Hospitals.

We understand that Lieut.-Colonel Florence, V.D., whose death we record on page 160, has left important bequests to several London hospitals. The Trustees of the National Gallery are empowered by his will to select any of his pictures which they consider worthy of a place in the National collection, and he has also left a sum of money to the Trustees.

The R.I.B.A. Gold Medallist.

A special general meeting of the R.I.B.A. will be held on Monday to elect the Royal Gold Medallist for the current year. The Chairman to move :—"That, subject to His Majesty's gracious sanction, the Royal Gold Medal for the promotion of architecture be presented this year to Sir Robert Rowand Anderson, LL.D., F.R.S.E., in recognition of the merit of his executed work, his services to architectural education, and his high character and lofty ideals in the art of architecture." Designs and drawings by the late W. Burges, A.R.A., for his house in Melbury-road and the decoration, fittings, and furniture are on view in the West Gallery.

The Shrine of Edward the Confessor.

A meeting of the Society of Antiquaries was held at Burlington House recently under the chairmanship of Bishop Browne. The Rev. H. F. Westlake read a paper on a recent examination of the shrine of St. Edward at Westminster Abbey. He said that certain measures necessary for the protection of the shrine in these troublous days had required the temporary removal of the wooden superstructure, exposing to view the cavity in which rests the coffin of the saint. Micklethwaite said that the shrine was destroyed by Henry VIII., but Sir Gilbert Scott was of opinion that the marble superstructure was taken down and only far enough to allow of the removal of the body, and he (the speaker) was inclined to think that Scott was correct. Feckenham, in his brief tenure of the revived abbacy of Westminster, seems to have replaced the body and set about the restoration of the shrine, the work occupying only twenty-two months and being hastily done.

The Board of Architectural Education.

The Council announce that the preliminary examination for the registration of candidates as probationers will be discontinued. Candidates will for the future be required to submit any of the following certificates, as may be satisfactory to the Council :—The Matriculation Examination at any University in the British Empire; the Senior or Junior (Honours) Local Examinations conducted under the authority of any University in the British Empire; the School or Leaving Certificate of the Oxford and Cambridge Schools' Examination Board; the examinations held under the Central Welsh Board; the Examinations for the First-class Certificate of the College of Preceptors; the Senior or Junior School Examination or the Matriculation Examination of the University of London; Senior School Certificate or a School Certificate of the Joint Matriculation Board of the Universities of Manchester, Liverpool, Leeds, and Sheffield; the School Certificate of the University of Bristol. Candidates who have obtained a success in any of the Board of Education Examinations in Art held in 1913 and subsequently will be exempted from "Geometrical Drawing and Freehand Drawing from the Round." The following Certificates from the Board of Education, South Kensington, are accepted as exempting from Elementary Mechanics and Physics :—A first class in the two Board of Education Examinations: Subject 6, Theoretical Mechanics, A. Div. 1, Solids; B. Div. 2, Fluids; Stage 1. Candidates who do not possess the Board of Education Certificates will be required to submit with their applications drawings showing their knowledge of either Geometrical drawing or Perspective, and Freehand Drawing. All applications for registration as probationers must be accompanied by a fee of two guineas.

ILLUSTRATIONS.

St. Paul, St. Bride, and St. Mary-le-Bow.

WE illustrate three fine views from photographs taken by Mr. George Trotman, and kindly lent to us. The view of St. Paul's taken cannot now be obtained. They are given in connection with our series of articles on London churches.

Wren's Churches.

WE give reproductions of two plates of St. Nicholas Cole Abbey and St. Mildred, Bread-street, from "The Churches of Sir Christopher Wren," by J. Clayton, published by Messrs. Longmans, Green, Brown, & Longmans, which we give by the courtesy of Messrs. Longmans, Green, & Co. Further notes on St. Nicholas Cole Abbey will be found on page 155, and on St. Mildred, Bread-street, in our New Year's Number.

St. Fé Railway-Station, San Diego, California.

BY the courtesy of the *Brickbuilder* we illustrate this fine architectural group of buildings, which show what we lose here because most of our railway-stations are treated as adjuncts of engineering schemes instead of what they should be—a legitimate branch of architectural design.

St. Pancras Station.

WE give a reproduction of the admirable coloured wood-cut of M. Emile Verpilleux, which, designed for a poster, gives an impressionistic effect of the sense of space and chiaroscuro of the huge iron roof.

◆

MEETINGS.

FRIDAY, FEBRUARY 25.

Glasgow Royal Technical College.—Mr. James Boyd on "Descriptive and Practical Geometry." 7.45 p.m.

MONDAY, FEBRUARY 28.

Royal Institute of British Architects.—Special and business meetings. Election of Royal Gold Medallist. Election of members. 4 p.m.

University Extension Lecture (at the Victoria and Albert Museum).—Mr. Banister Fletcher on "Inigo Jones and His Works." 4.30 p.m.

WEDNESDAY, MARCH 1.

Carpenters' Company.—Mr. D. S. MacColl on "The Work of Alfred Stevens." 7.45 p.m.

Institution of Civil Engineers of Ireland.—Ordinary meeting. 8 p.m.

Royal Archæological Institute (at Burlington House, Piccadilly).—General meeting. 4.30 p.m.

University of London, University College.—Professor Adshead on "The War Memorial as a Monument on a Battlefield, as a Mausoleum, or as the Tomb of a Military Hero." 5.30 p.m.

Institute of Sanitary Engineers (Sessional Meeting at Caxton Hall, Westminster).—Lieut. Bernard R. Hebblethwaite, A.R.I.B.A., 2nd London Sanitary Co., on "Sanitary Work at the Front with the Expeditionary Force." 7 p.m.

THURSDAY, MARCH 2.

The Royal Institution.—Professor L. W. King on "Recent Excavations in Mesopotamia." 3 p.m.

University Extension Lecture (at the British Museum).—Mr. Banister Fletcher on "Roman Palaces and Pompeian Houses." 4.30 p.m.

OBITUARY.

Mr. H. L. Florence.

We regret to announce the death, on February 17, at Bath, after a short illness, of Mr. Henry Louis Florence, of No. 9, Princes-gate, Hyde Park, S.W., and No. 16, Royal-crescent, Bath, in his seventy-fifth year. Mr. Florence was Soane Medallist, 1869; he was elected in 1865 an Associate, and in 1878 a Fellow, of the Royal Institute of British Architects; he served as a member of Council and as Vice-President, 1897–9. He became a member of the Architectural Association in 1862, and served as President. He was elected also a Vice-President of the Architects' Benevolent Society, 1914–16, in which he manifested great interest, as evinced by both his active work as a member of the Council and his generous contributions, which included a gift of £1,000 City of London Corporation Bonds, to its funded property. He was Master of the Haberdashers' Company, 1914–15.

Mr. Florence practised at No. 3, Verulam-buildings, Gray's Inn, W.C., in partnership with Lewis Henry Isaacs, F.R.I.B.A., F.S.I., who died on October 17, 1908. Of the most important architectural works carried out by them we may mention the (old) Holborn Town Hall, Gray's Inn-road, with subsequent improvements and decorations (December 13, 1879*); London and Joint Stock Bank, Paddington branch (May 31, 1879*); Nos. 7–8, Bell-yard, Fleet-street (February 24, 1883*); the Northumberland-avenue—renamed the Victoria—Hotel (May 1 and November 6, 1886*); warehouses in Rochester-street, Westminster, for Messrs. J. & W. Farmiloe (August 7, 1886*); the Empire Hotel, Kirkley Cliff, Lowestoft (July 26, 1898*); and the Holborn Viaduct Hotel and Station (June 17, 1876*). They were the architects of the two houses built on the site of Nos. 13–5–7, Delahay-street, Westminster, for Mr. Edward Lloyd; houses in Carlos-place, Mount-street, W., for Mr. G. Fosta, 1894–5; the Carlton Hotel, Pall Mall, 1897–9, as carried out by them after the death of Mr. C. J. Phipps, and in accordance with his drawings; premises for Messrs. Woolland Brothers on the sites of Nos. 1–7, Lowndes-terrace and 1–3, Seville-street, Knightsbridge; enlargement, in 1900, of the First Avenue Hotel, High Holborn, W.C.; and in 1905 the alterations and improvements of the United Service Clubhouse, Pall Mall; the Coburg Hotel, Mayfair; King Lud tavern, Ludgate-circus, E.C. (April 1, 1871*); London and Joint Stock Bank, St. John-street, Clerkenwell branch (February 24, 1872*); Cadby's pianoforte factory, Hammersmith-road (December 26, 1874*); and the Paddington Baths and Washhouses, Queen's-road, Bayswater, 1893, since pulled down for Whiteley's premises; No. 1, Little James-street, Bedford-row, W.C.; and the improvements and alterations of "Keith House," Bayswater-road, for Sir C. Robinson; the new library, pension-room, and classrooms, Gray's Inn, with restoration of the Inn Hall; offices, Salisbury-square, Fleet-street, for Edward Lloyd, Ltd.; "Coombe House" and "Coombe Farm," near Croydon; St. James's Park railway-station for the Metropolitan District Railway; Queen Victoria Memorial, Kensington High-street; Institute of Journalists, Tudor-street, Whitefriars, E.C.; and library, museum, and improvements, Freemasons' Hall, Great Queen-street. W.C.

The funeral service was fixed for Wednesday last at All Saints' Church, Ennismore-gardens, Princes-gate, followed by interment at Nor Cemetery in the afternoon of that day.

Mr. Florence was the eldest son of the J. H. Florence, of Streatham, and a Fello the Geological Society. He was R Academy Travelling Student and Medallist, 1870; he studied in the At Questel, Paris, and travelled in Italy. 1892 he retired as a Volunteer officer with rank of Lieut.-Colonel, and received Volunteer decoration. He was a memb the Arts and the Junior Athenæum Cl music and travel were his recreations.

Mr. J. Park.

Mr. James Park, building contra "Floradale," Cranford-road, Aberdeen, recently died as the result of injuries rec in a tramway accident, was a native of Buchan district. Mr. Park was concerne the work of opening up Ashvale-place, U grove, Rosemount, the Mannofield district, several other of the newer areas of the city. Inverurie he had a large share of the bui work. One of his most recent impo contracts was the erection of the mansion h of Tillycorthie, together with the stea and numerous cottages on the estate. also erected the public hall at Udny.

Mr. J. H. Shaw.

The death is announced of Mr. Jo Howarth Shaw, retired builder, "St. Alba Skircoat Green-road, Halifax. Deceased, was sixty-four years of age, built a great of the property in the Westbourne es Salterhebble, and also at Skircoat Green.

Mr. C. A. Hayes.

The death is announced of Alderman C Hayes, ex-Lord Mayor of Bristol and of Messrs. C. A. Hayes & Sons, builders.

FIFTY YEARS AGO.

Underground Railways for Paris.

THE French metropolis has just placed in a state of great excitement by project of M. Edoux, the civil engi who proposes to effect as great a revolu under that city as M. Haussmann, Prefect, has done above ground. His is to construct a system of subterranean ways diverging from the Palais Royal as common centre and connected at their by an outside circle. One line is to go d the Rue de Rivoli, under the Place d Madeleine and the Rue Tronchet to railway terminus of St. Lazaire; anothe to go under the central Market-halls thence either under or over the Seine to terminus of the Orleans railway. From Market-halls a branch is proposed to carried under the Boulevard de Sebast and the Boulevard de Strasbourg to termini of the Northern and Strasb railways. A second branch is to go u the Boulevards and the Place de la Bas to the termini of the Vincennes and Lyons railways; and, finally, a line is jected from the Palais Royal, under Champs Elysées, to the Bois de Boulogn

AILWAY-STATIONS AND BRIDGES.

HERE are two architectural problems which have been surrendered to engineers, but which are pre-eminently tectural in their character, and must be ed for architecture if we are not in the e to have a world in which the effect of any ovement in architectural character is not ruined by the intrusion of engineering ions of problems which belong to con- tive architecture—we allude to bridges railway-stations. Railway-stations, big small, are among public buildings which most prominent and constantly visible r in the form of great terminal stations he small local station with its waiting- s, ticket offices, station-master's house, the bridges for passengers which pass over lines. None of these structures as a rule ssitate intricate calculations; they are le problems in which considerations of and mass and simple planning are alone ired. If engineers had the monopoly of non sense they would have a right to oyment which none could gainsay—if their was ingenious planning, such structures d fall within their scope; as it is, they outside it, while strictly appertaining to tecture. The foot-bridges over the rails, red or uncovered, could with little skill care be made pleasant to look at instead n eyesore, as is frequently the case, and introduction of ferro-concrete is a means eby the use of naked steelwork can be led when size and position make a wooden ture inadmissible. The corrugated-iron over the wayside station is unreasonable, use the station is not a temporary building, has the same claim to permanence as a e or municipal building, while the design loor and window openings and the con- ation of proportion are as important as in ase of any other buildings. Where archi- have been employed in such work in and, as in the case of many of the stations e Midland Railway, there are signs that have been pushed too much into a rdinate position by engineers, and we have examples to compare with the railway- ons of America, which have in large ure been treated as legitimate subjects for employment of skill in design. The case he architectural treatment of great terminal ons, usually combined with hotels and adjuncts, is if anything even stronger; compared with other buildings in our s, they are usually imposing on account oth size and position, and the intricate ing and arrangement required renders treatment an architectural problem of irst order. There is little chance of these ems being sufficiently considered as long e railway companies, aided by the interests h they can control in Parliament, are ed to obtain powers which enable them cape the control of the local authorities of entres in which their stations are placed, he companies are largely controlled and d by the advice of their engineers, and that advice is is demonstrated by the ay-stations throughout the land.

t less important than railway-stations are reat bridges of communication for road, and other purposes, and what the world st in picturesqueness and charm is shown e "Book of Bridges" by Mr. W. Shaw ow, which is admirably illustrated by ductions in colour and line from drawings r. Frank Brangwyn.* From the point of of the student the book is written in too rsive a style and lacks completeness, it illustrates not the great bridges of the so much as those bridges which Brangwyn has chosen as subjects for his rations. Thus we miss Waterloo and nond Bridges, and that great monument sthetic skill, the Pont Alexandre III., , with the Gare de Lyon, show what rn French architects can accomplish njunction with engineers. Nor does that masterpiece of modern engineering at its best—the Forth Bridge—form a subject for illustration, as it well might do as an illustration of what is best in modern design, for the book is principally a lament of the failure of the modern world to carry out the tradition of architectural achievement of the past without the critical and analytical discussion of the principles by which we can make good the failures of the last century. Mr. Sparrow makes a great point of the failure of modern bridge-builders to recognise the fact that a bridge is easily destroyed, and that means should be taken as of old by fortification to render such destruction difficult, if not impossible. This point of view assumes that the modern, like the ancient, world should prepare itself for the possibility of war, an assumption which is only justified if we hold the present struggle to be an ordinary and not an extraordinary incident in the history of modern civilisation. Believing as we do that the war is due to the gigantic miscalculation of Germany as to the nature of modern conditions, and the belief that it is possible by brute force to set back the hands of the clock for centuries, and by blood and iron build a barrier against modern progress, it may well be assumed, when the attempt has definitely failed, that future progress will make its renewal an impossibility. The issue is simply the re-establishment of barbarism, aided by all the inventions of modern science, or the final establishment of a greater Pax Romanum for the civilised world in which fortified bridges will have no more place than strategic railway lines. The problem of bridge-building in the future seems to us to depend on the manner in which architects and engineers can learn to work together and the extent to which the naked steel constructions of the nineteenth century can be replaced by ferro-concrete, brick, or masonry constructions; for we must recognise that in iron and steel we use materials which, like wood in the past, are perishable, and which depend more than wood on constant attention and painting to preserve their safety. With the recognition of these facts we shall come to the conclusion that the short-lived reign of the engineer as the sole designer of bridges is at an end, and that they should be restored to the realm of architecture to which they belong, but that in these days of colossal schemes architect and engineer are dependent on each other's knowledge and skill, the problems of the modern world demanding co-operation rather than rivalry between two allied professions, neither of which can be independent of one another.

There is room for a great work on bridges in which the works of the past will be illustrated and adequately described and the evolution of a great branch of constructive design shown; but this does not do away with the value of a book which, though not dealing with technical matters, shows the lay reader how important and interesting the subject is. Among many delightful studies of colour we may mention the Pont Henry IV. over the Vienne at Châtellerault in France, built by Charles Androuet de Cerceau in 1564–1609, which formed one of the latest of the Bastille bridges, the Pont Valentré at Cahors-sur-Lot, an example of the fortified bridges of the thirteenth century, and a wonderful illustration of the Alcántara at Toledo.

But it would be difficult to weigh the relative merits of the magnificent series of thirty-five colour plates and thirty-five pen-and-ink sketches with which the volume is illustrated; they would speak for themselves without the accompanying letterpress, and show us the paramount value of design in a field of the greatest importance to those who can respond to the appeal which beauty has for most of us. They form an urgent appeal to those who feel that after the present strife modern Europe should be made a more beautiful and happier place to live in than we dreamed of before.

A Book on Bridges." Pictures by Frank wyn and text by W. Shaw Sparrow. (London: Lane. 21s. net.)

DAYLIGHT SAVING BILL.

In the House of Commons recently, Mr. Asquith, in reply to Mr. Peto, who asked whether the Government proposed to introduce a Daylight Saving Bill, said: "I am afraid I cannot introduce legislation on this very contentious subject."

THE CARPENTERS' HALL LECTURES:

SOME MOVEMENTS IN MODERN ART.

ON Wednesday, February 16, Mr. William Strang, A.R.A., gave an interesting lecture on "Some Movements in Modern Art," in which he gave an admirably clear and concise summary of a subject upon which few but artists and a small number of art critics have sufficiently definite ideas. Art, he said, cannot be rightly judged unless we know the intention which lies behind the artist's endeavours, and the definition of schools of artistic thought must enable us to appreciate better the work of the individual artist. Art is not a progressive improvement in excellence, and does not depend, like science, on the accumulation of actual knowledge, but is an individual means of expression, and in that way is like the art of language. The desire to create in all ways a new art is doomed to failure, as all art of value must grow, whether by development or rebellion, out of what has gone before, and this process has gone on in art with one exception. Lack of authority and tradition may be a great evil, as artists will not achieve so much as if they were working together. It also often results in cringing art, servile, and seeking by any means for public approval and favour by freakish methods. But it is impossible to expect art to have ideas greater than are prevalent in its own time, and when individual anarchy is carried to such lengths as at present it is impossible to expect anything great in art.

Great art may be pictured as being independent of the goodwill or patronage of majorities or minorities, aristocratic and dominant, ignoring approval or disapproval. Such godlike art has not existed in modern days, in fact since the great and austere art of Egypt, whose art was calm, simple, and dictatorial, and seems to be a standing reproof to the petty little vices of individualism.

There is no trace of pleading for approval in it, no sign of seeking to please; it is aloof, and seems to put the onus of sympathy or admiration on the beholder, and it imposes itself on the human imagination as no other art has done.

It must be remembered in speaking of movements that a movement sometimes occurs and flourishes in one country, but the idea originates with a single artist in another country, such as was the effect of Constable in France. Each movement has not a separate period, but movements overlap, and two may flourish concurrently in the same country.

We in England have never suffered from Classicism as most other countries have. France alone has produced under it great works which will live, and David in the first period in his portraits, and Ingres in the second, also in his portraits, have survived an influence which in other countries was barren of good results—both succeeded in a branch of art which requires more naturalism than any other. Where in England definite foreign influences can be traced, as in landscape painting, they were rather from Holland than from Italy, and Rembrandt, Ruysdael, and Hobbema have been the forces which have moved English artists. Holland itself had a period of Italianised painting, but its works are not remembered. Spanish art came under the influence of the Low Countries, and at a later period of Italy, but neither of these influences produced works of great merit, while the art which is indigenous to Spain and was distinguished by uncompromising naturalism has retained its place and is still a living force. Velazquez returned from two visits to Italy absolutely untouched by its influence, and El Greco, though a foreigner living in Spain, was characteristically Spanish; as was Goya, who lived at the end of the eighteenth century.

The Pre-Raphaelites.

The most noticeable body of modern painters in this country were the Pre-Raphaelites, who started in 1850 with three or four members, young, enthusiastic, and clever, with a fresh gospel, or rather an old one adapted to modern performance. Rossetti, Holman Hunt, and

Millais were the originators of the movement, the theory underlying which was that art should be based on nature and truth, which, in view of the conventional art of the time, was an undiscovered country. They considered that the natural truthfulness existing in Italian art till the time of Raphael had gone, and that later conventions had eliminated truthful expression. They did not copy the old Italian pictures they admired, but tried to discover the principles governing them. They did not believe in giving a general impression of any subject, but, while copying all details, still tried to retain the larger effect and significance of the picture. They founded a magazine to defend their theories, which had Ruskin's powerful support. The ideas of the founders of the movement, bred in a tumult of spirit, as interpreted by their followers frequently showed signs of exhaustion, for a painter can seldom make full use of an idea which is given to him. Ford Madox Brown and Burne-Jones were younger members of the brotherhood, whose work was strongly individual; all were strongly influenced by poetic literature, and much of the best work done took the form of illustrations to literary works. Rossetti was both poet and painter, and his poetry has been an inspiration to later painters. The Bible was a fruitful source of inspiration, as it was to Rembrandt, and it is well to observe the different standpoints: Millais was more of a realist than the others, while Burne-Jones was less of a realist than any of them, and with William Morris was closely connected with the arts and crafts' movement; Holman Hunt and Ford Madox Brown were closely allied; Hunt had a deeply religious character, and Madox Brown a great dramatic sense. Outside this movement were Watts and Alfred Stevens, who comes nearer the definition of a great artist that this country has yet produced, for he was painter, sculptor, architect, and designer, and magnificent in all. Watts's work was based on Venetian art, and their gorgeous work was echoed in his pictures.

The Romanticists.

About this time a revolt occurred in France against existing forms of art, and the Romanticists fought against Classicisim, and went to extremes both in art and literature. Gericault and Delacroix were typical of the school, and when Delacroix's picture, "Dante's Barque," was exhibited it was seen that the revolt against Classicism was complete. Owing to the influence of Constable and other English artists, they devoted themselves chiefly to landscape. Rousseau, Corot, Diaz, and Daubigny may be mentioned as successors to Gericault and Delacroix. Constable saw vividly and with delight that trees were green and skies were blue, and all nature had a brilliance and sparkle that tradition had never noted, and which he threw overboard. He was the first to get the effect of light and air, and all this was studied not for the sake of realism, but for the expression of a "mood" in landscape, mood meaning a human feeling which one would not think nature possessed, but "mood" is nature plus the painter. Thus it was that Constable appealed to the new French school, whose strong point was their feelings. Daumer and Gavarni were the greatest of those who were called caricaturists. Daumer was also a great painter, and his series of pictures of Don Quixote are the most human caricature of all time. Jean Millet did for the country what Daumer did for the city, the former drawing with sympathy the outcasts of the city, the latter the peasant. He did not escape the danger of sentimentalism. The last of this generation of painters was Legros, whose art was severe and dignified.

Realism.

Most modern movements in art owe their origin to the French, and no means were considered too violent to draw attention to the new creed of realism—historical painting was considered nonsense, style humbug, by Gustave Courbet, the apostle of the new creed. Bastien-Lepage followed, carrying naturalism a stage further; he was more photographic in effect, and used a neater and tidier technique. Another artist of the school of peasants was L'Hermite, whose naturalism was more robust than that of Lepage, while his work suggests more careful observation.

Impressionists.

The new school followed the banner of revolt led by Manet, and devoted itself to the impressions made by things rather than to the appearance of things themselves, and since the accentuation of the planes disturb colour value the planes are almost obliterated in Manet's pictures. As a matter of fact Manet's manner was founded on Velazquez and Goya, though his manner is very different from theirs. Whistler more than Manet made atmosphere his chief aim; Degas was another great exponent of the school.

Post-Impressionists.

The last great movement was based on the assumption that representation had reached its highest development, and that a simpler convention was necessary to make a more direct appeal. Realism had had its day, and the reaction was in the direction of more primitive forms of art. Cezanne, Gangain, Von Gogh were representative of the movement, which in its aim at avoiding photographic representation went to great lengths. Cezanne was a pupil of Manet, and adopted his scheme of high tone and bright colour in his pictures. There is a tremendous impasto suggesting plastering and a wilful or helpless bad drawing.

The lecturer ended by devoting a few words to later developments, which he said constituted a complete break with the past, since all previous schools had been representative, while the new theory was that pictorial art should not represent any object, but by an arrangement of lines and colours produce an emotion without the use of any known symbol. The theory could never successfully compete with ideas founded on representation, while pictorial art must continue to be founded on representation however expressed.

THE BRITISH INDUSTRIES FAIR.

THE Board of Trade has done more to deserve its title since the outbreak of war than before, though its efforts have been partly neutralised by the consistency with which the Government have refused to make any unequivocal statement of what their attitude is to be when peace returns in important matters which are vital to the trader seeking for new markets. The compromise arrived at in regard to the dye industry has not given the same confidence to manufacturers that a frank promise of protection for nascent industries for a period following on the war would have done, nor can the special treatment applied to the dye industry be repeated on a large scale and applied to other trades.

The exhibition now being held at South Kensington is in all the circumstances of the time a creditable one in view of numerous obstacles. The exhibits are unduly crowded together, as may be expected until these fairs are held in a suitable building with adequate space. The exhibitors are handicapped to a great extent by the shortage of labour and material produced by the war, which in some cases will prevent their being able to accept orders which would be freely given; and, lastly, many buyers who would be present in normal times must be prevented from attending at the present time. Still, the support and enthusiasm with which the scheme of emulating the Leipzig Fair on British ground, to promote British trade, has been received enable us to look forward to the years of peace in which we shall see traders from all parts of the Empire attending a great annual fair which will be representative of the whole manufactured products produced in the Empire, together with the representatives of the great nations abroad desirous both of buying from and selling to us.

The present Fair only represents certain limited sections of British manufactures, those of toys, fancy goods, and stationery and printing. The amount of ingenuity and enterprise which have been devoted to toy making has produced very marked results, and gives promise that in future children will be able to dispense with toys "made in Germany," and means that the million and a half which said to be spent in foreign toys yearly will rema in the country. The immense variety and ing nuity shown in the design of every kind mechanical toy is full of promise for the futur and the workmanship and finish of many those shown leave little to be desired. W understand that the Central Committee Toy Industries has done a most useful wo in co-ordinating and assisting many sma and scattered industries.

The show of fancy goods is good and repr sentative, but there is room for the employme of more skill in design in many of the articl turned out, though they probably appe to popular taste as they are.

The glass and china section is a little di appointing, considering the great amount excellent design and workmanship which ca now be obtained, but it is probable that ma firms have not exhibited owing to the impos bility of executing orders now. Some of th finest work exhibited is that of Messr Wedgwood, who maintain the very hig standard which has always been associat with their name.

The "Moorcroft Ware" is excellent colour and design; the whole of it is han made on the potter's wheel, colour, glaze, an clay being fused together and homogeneous.

Rust's Vitreous Mosaic Company exhib some very good tile work, and also show phot graphs of some interesting mosaics whic they are executing for church decoration designed by Mr. Brangwyn. Pilkington Tile and Pottery Company, of Manchester, al produce some very excellent tiles.

All classes of glass work, including laborator glass and lenses, mirrors, and lighting glass, well as table glass, are included in the exhibitio and it is chiefly in the design of table gla that it would seem much leeway has to be mad up. It would be well if each of our man facturers were to form a little museum of o glass and study it, basing new designs on o tradition until a better school of design grow up automatically, as it would do, but in sayin this we must add that firms of the type Messrs. Osler, who represent modern design its best, are not among the list of exhibitors.

By far the most promising section of the Fa is that devoted to printing. The best Englis printing and colour work can hold its ow among any rivals, and the exquisite wor produced by the Medici Society, Ltd., Londo as shown in their Riccardi Press books, attai to the greatest excellence both in design an execution; their coloured reproductions of o masters are the best we have seen produce Messrs. Fisher Unwin show some very goo work of varied character, and among provinci printers may be mentioned Messrs. Solomon Whitehead, Ltd., of Birmingham.

Naturally, firms like Messrs. De La Ru Letts, the Fine Art Society, and others maintai the high reputation their work has alwa acquired.

We hope that the next Fair held will housed in a suitable building, and will embra the widest range of industries.

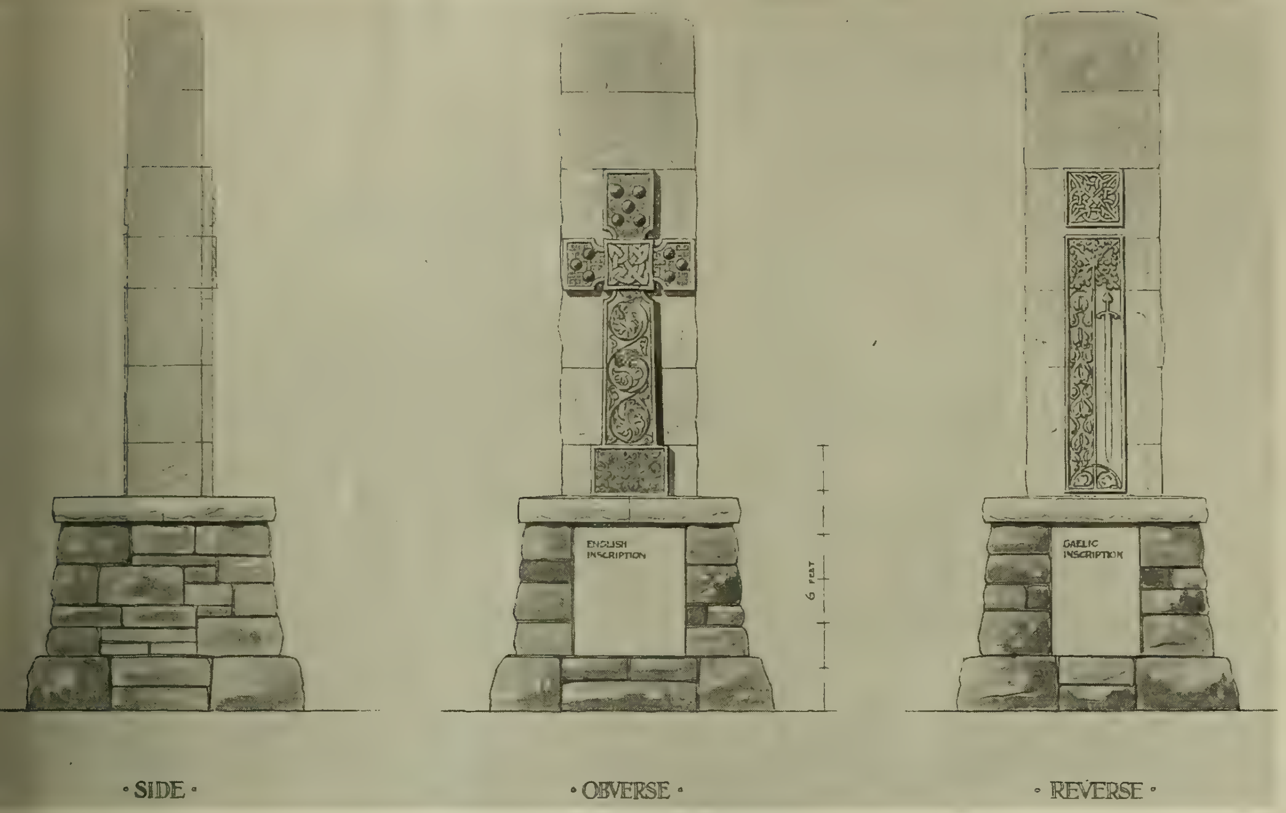
CELTIC MONUMENT, ARGYLLSHIRE.

THE accompanying illustration depicts monument about to be erected in Argyll commemorate the life and death of a Highlan officer who was killed in Flanders.

The monument is designed to find kinsh in a close degree with its surroundings, th chosen site being that of a sequestered sp in a peaceful glen guarded by rugged mountain

The enriched cross, emanating from th shaft of a natural-faced rock, whose top ha no defined limiting feature, symbolises a li cut short, in which the highest good has bee attained by the sudden call to the suprem sacrifice in the cause of truth and right.

The style of the work is Celtic, based upo the sculptured stones of Islay and the Scottis Highlands generally. The ornamentatio embodies the ancient spiral, fret and interlacin enrichments characteristic of the Weste examples. The structure will be carried o in the grey granite of Argyllshire. The archite is Mr. Colin Sinclair, M.A.



Celtic Monument, Argyllshire.

BOOKS.

ometer Surveying. By W. E. Yorke
OT, A.M.Inst.C.E., F.R.Met.Soc.
ndon: E. & F. N. Spon, Ltd., 57,
ymarket. 1916.)

is a very practical work by an author
ughly conversant with his subject, and,
points out, is intended as an aid to the
nt to teach himself. He gives a most
lete description of the tacheometer—a
elaborate and complicated instrument—
is intended to take the place of the
ary theodolite level and chain, and
es the surveyor to ascertain the direction,
nce, and altitude of all points within
of the instrument from one set of observa-
taken with it, and thus save an immense
nt of labour in making surveys in districts
there are many undulations and
ions of surface. No pains have been
to render the work as complete as it
sible to make it, and the many examples
of the use of the tacheometer and other
ying instruments, with elaborate calcu-
s, are a testimony to the thoroughness
which the author has done his work and
mplete knowledge of his subject.

s Architects' and Builders' Pocket Price-
k, 1916. Edited by Clyde Young,
.I.B.A., and Stanford M. Brooks,
.I.B.A. Forty-third edition. (London:
& F. N. Spon, Ltd., 57, Haymarket.)

e present time one can say little as to
alue of a price-book, and to attempt to
se the prices would be futile, as the
t varies so much week by week that it
ossible to fix anything like a standard.
work is in a very handy form. One
e that may be useful is the list of constants
our, and those we have been able to
re with the actual cost of work are
correct, although, of course, circum-
s will cause a marked variation. We
that the chapter on Approximate Cost
ldings might be revised with advantage.
ome years since those given would apply,
en with the 20 per cent. added as recom-
d in the fly-leaf would certainly not cover the cost of average buildings at the present time. As we have said above, little can be said in the way of criticism of individual prices, but there has been an obvious attempt to bring the work up to date, a very thankless task under present conditions.

Applied Mechanics. By Ewart S. Andrews, B.Sc. (Cambridge: University Press. Price 4s. 6d. net.)

The subject of Applied Mechanics is a very important one to engineering and architectural students, and yet it is often neglected on account of the difficulties met with during study. These difficulties arise owing to many of the text-books being vague or written in a style which is beyond the average student's comprehension, and to many teachers not having sufficient knowledge to express themselves in a simple and explanatory manner. The author of this volume has realised these facts, and he has presented the elementary principles of mechanics in such clear terms that the reader of average intelligence will not be disheartened and deterred from proceeding with the complete study of the subject. The volume opens with a clear exposition of the representation of forces, and the reader is then taken through the questions of moments and leverage. This is followed by chapters devoted to work, power, and energy and machines and efficiency. Velocity is dealt with, and we then have a very interesting chapter on Newton's Laws of Motion. Stress and strain, riveted joints, forces in framed structures and beams and girders are all fully considered, and the portions devoted to these items will be of great value to the student, as they are clearly written, and no pains have been spared to keep the text as simple as possible, while all the essential points are dealt with. The remaining chapters deal with the centre of gravity, friction, and lubrication, motion in a curved path, mechanisms, and belt, chain, and toothed gearing. Many simple experiments are given in order to make the principles clear, and exercises are set at the end of each chapter, together with a summary of the matter contained in that chapter.

The book is quite one of the best that we have seen on Applied Mechanics, and it should prove admirable for class purposes or individual study, while it can be thoroughly recommended to all our readers.

The Practical Design of Steel-Framed Sheds. By Albert S. Spencer. (London: Constable & Co., Ltd. Price 10s. 6d. net.)

The author of this volume has attempted to standardise shed-members and foundations, because he is convinced that the designing of sheds is left almost entirely to manufacturers of such structures, with the result that inconsistent and inadequate structures are erected.

It is quite true that where competitive designs and estimates are obtained without rigid conditions certain risks are taken by designers in order to keep the price as low as possible and thus secure the work; but it is quite unlikely that any technical book will prevent such methods continuing. The practical design of steel-framed sheds or any other form of construction should not be undertaken by unqualified persons, and if qualified engineers, working for competitive manufacturers, deliberately refrain from providing a proper factor of safety in order to keep down the cost the only remedy will rest with the client, and he is unlikely to understand the work.

The author deals with the resistance of steel-framed sheds to wind forces and various standard types of sheds, with methods of calculation and explanatory notes. Chapters are also devoted to standard stresses and sections for ridged-roof principals, external coverings and gutters, pipes, ventilation, doors, windows and skylights. The text is well-arranged and explanatory, and printed in nice bold type, while the diagrams are good. Several well-drawn plates are attached at the end of the book, and these should be helpful to the reader.

◆

EAST SUTTON ESTATE, KENT.

In the sale of the East Sutton Estate, near Maidstone, which belonged to Sir Robert Filmer, who died of wounds received in France, the ruins of Sutton Castle, near Sutton Valence, originally built, it is believed, *temp.* Edward I., and a stronghold of Aymer de Valence, Earl of Pembroke, were sold for £100.

THE BUILDING TRADE.

INCORPORATED CLERKS OF WORKS' ASSOCIATION.

MR. ERNEST NEWTON, A.R.A., President of the Royal Institute of British Architects, took the chair on Saturday night at the Holborn Restaurant, at the thirty-third annual dinner of this Association, and was supported by Mr. E. T. Hall, F.R.I.B.A., Mr. H. Austen Hall (President of the Architectural Association), Mr. Alfred Gotch, F.R.I.B.A., Lieut.-Colonel A C. Preston (Carpenters' Company), Mr. Walter Lawrence (London Master Builders' Association), Mr. A. Keen, F.R.I.B.A., etc.

Mr. G. W. Ramplin submitted the toast of the " Architects and Surveyors," and, after referring to the falling off in private building owing to the war, pointed out that large sums of money were being spent on the erection of munition works. These, he took it, would be used after the war for industrial purposes, and the consequent extension of the country's trade should lead to the erection of houses and the employment of architects and surveyors.

Mr. Alfred Gotch, in reply, said he was pleased the toast was that of " Architects and Surveyors," because as one who practised his art—or should he say followed his business ?—in the country he still styled himself an architect and surveyor. He imagined the distinguished gentlemen surrounding him who practised in London called themselves architects only. He thought it a great pity that the sub-title of surveyor should be discarded. On looking back on the history of architecture in this country, they found that the two most distinguished names connected with it, Inigo Jones and Christopher Wren, were primarily surveyors, and it was only a modern fashion to call them architects. The proposer had referred to the present state of building, and he was bound to say architects and surveyors were rather in the position of the gladiators of old who, when they were introduced into the arena and saw the devouring lions in front of them, hailed the Roman Emperor in the words, " We who are about to die salute you." By a slight change of words he might, on behalf of the architects and surveyors, say, " We who are about to die thank you for this toast." He hoped the words of the proposer might prove true, but so far as he could see the vista in front of them was dismal. However, they must cast such thoughts away and try to be cheerful in the face of annihilation.

Mr. A. F. Dorey proposed the toast of " The Worshipful Company of Carpenters," and expressed the gratitude of the Association to the Company for their many acts of kindness.

Lieut.-Colonel A. C. Preston acknowledged the toast, and said, while the Company had given up all their entertainments, they were keeping on the technical schools and the popular lectures.

Mr. J. R. Scales, in proposing " The Builders and Visitors," pointed out that the gathering had not only its social side, but also its benevolent side, and he trusted that the visitors would consider the claims of the Benevolent Fund.

Mr. Walter Lawrence, in reply, said the building trade was simply a shadow of its former self. Many private jobs were stopped, and there were rumours that the Government were about to take even more stringent measures in regard to the private work now going on. His own view was that they should have taken the matter in hand sooner if it was needful. At the moment they could take it that they had only one contract in hand, which was to beat the Germans, and he submitted that time was of the essence of the contract. As to the building trade, they must make the best of it as Englishmen. He had no doubt that members of the architectural profession, like the master builders, had offered their services to the Government without fee or reward, but he was sorry to say they had not been received with open arms.

The Chairman, in proposing " The Incorporated Clerks of Works' Association," said it was founded in 1882, and for twenty-five years was self-supporting. During that time the Committee had granted assistance from subscriptions of members to clerks of works who had been unable through sickness to follow their employment. But the funds were only sufficient for temporary relief. The Committee then, with the help of a few friends, formed a benefit and pension fund, to enable them to assist members in temporary distress and to grant a small pension to those who through old age were compelled to retire from active service. It was to the annual dinners and outings that the Association looked for support, by an appeal from the Chairman to the visitors present. There was a membership of 127, consisting of members, hon. members, and Associates. By the kind permission of the Carpenters' Company meetings were held once a month, papers were read, lectures given. Members were elected after careful consideration, and all so elected were men fully qualified to undertake the duties of clerk of works. He would call special attention to the fact that it was to the Chairman's appeal at the annual dinner that the Association looked for support for its benefit fund. The war, in almost entirely stopping building, had naturally hit the clerks of works very severely, and, although there were at the moment many clerks of works who were eminently suited for war work, he believed he was right in saying that, whatever might be the case as regarded individuals, as an Association they had not been made use of. In the eyes of the authorities it would almost seem that organisation was a sure bar to employment. Naturally this fall in employment meant corresponding difficulties for those unemployed. Savings would not last for ever, and there were many who had already exhausted their economies, and there must be many who were within sight of this catastrophe. It was here that the benefit fund came into play, but even benefit funds could only be of service if those who were able to do so subscribed to them. Every little helped, and he hoped none of those to whom he was appealing would be deterred from giving because they felt they could only give very modestly. All of them—architects, contractors, surveyors, quantity surveyors, clerks of works, all in fact connected with the great art of building—were suffering more or less, but they could still do something to help each other. One read sometimes of flocks and herds overwhelmed by a snowdrift drawing close to one another for warmth and so surviving. In the same way he hoped that by holding together they might weather the storm and emerge when it was all over, a little battered it might be, but ready to take their part, each in his own sphere of activity, in carrying out all the work which they hoped might have to be done in the future.

Mr. E. Stevens (President of the Association), in reply, said there were two points he would mention which they considered of importance. Their Secretary had written to the Royal Institute of British Architects, asking them to receive a deputation on the question of salaries, and they had had no reply. He hoped their Chairman would see if a meeting could take place. The second thing was that they were given to understand that they were not under the Employers' Liability Act, and they wanted architects to put a clause in their specifications covering the insurance clause.

Mr. A. Fincham proposed the health of the Chairman in eulogistic terms, and it was received most cordially.

The Chairman said he well remembered in his early days in what respect he held the clerk of works. He was a mysterious being full of traditional building knowledge, knowing the brand marks of timber, and even the natural bed of Caen stone. Naturally ti had somewhat divested him of his mysteri attributes, but his feelings of respect remain as strong to-day as they were forty years a He had made a note of the remarks of Stevens, and he supposed the letter he referr to had gone astray, as it had not come un his notice.

THE YORKSHIRE FEDERATIO OF BUILDING TRADE EMPLOYERS.

THE monthly meeting of the Executi Council was held in the Metropole, We street, Hull, on Tuesday, February 15. R. Finch (President) occupied the chair, a fifty-three delegates were present.

Munitions Act, 1916.

Members were reminded that it was necessa to apply to the Ministry of Munitions for order to be made for all works sought to brought under the provisions of this Ac and it was resolved :—" That members urged in all cases where they are engaged the construction, alteration, or repairs works of construction for naval and milita purposes, and of buildings in which muniti work is or is intended to be carried o and the erection of machinery and pla therein, and the erection of houses for accommodation of persons engaged or about be engaged, to apply to the Ministry of Munitio for an order for the work to be brought und the provisions of the Munitions Act."

Pre-War Contracts and Suspension of Works.

The President reported that this importa matter had been referred to a Special Committ of the National Federation. The Committ were also empowered to deal with the furt question raised by the Yorkshire Federati namely, the compensation to be paid contractors on works suspended by pub authorities or private clients at the request the Government in pursuance of the natio policy of retrenchment. It was resolved: " That the importance of this matter and urgency and necessity of collecting informati on the points raised be impressed on Lo Associations, and members requested furnish all particulars within their knowledge the Federation Secretary at once."

Reserved Occupations.

Attention was drawn to the desirability contractors being secured of a requisite sup of labour to complete works which are hand for Government purposes, and following resolution was agreed to :—" Th the Federation be requested to make urg representations to the Reserved Occupatio Committee to include in the list of reser occupations workmen engaged on works to used for Government purposes, in order t such works be carried out with expedition, contractors and workmen while engaged such work be exempt from military service.

Co-operative Societies and Income Tax

The immunity of co-operative societies fr income tax and excess profits duty was c sidered, and after discussion the follow resolution carried :—" That the attention the Prime Minister and the Chancellor of Exchequer be drawn to the unfair inequitable consideration granted to operative societies whereby such socie are enabled to carry out constructional w under preferential conditions, owing to th immunity from payment of income tax excess profits duties ; and, in order that incidence of taxation should fall equally u all engaged in constructional work, co-operative societies should be required pay income tax for building work carried

ıem, and thereby place them on an equality
building contractors."

Next Meeting.

. H. Connell on behalf of the Selby Asso-
ɔn invited the Federation to hold the next
ing in that town. The invitation was
ɔted, and the meeting fixed for Thursday,
h 16.

NEW GOVERNMENT CONTRACTS.

War Office.

ping and Fittings, Metal.—J. Brotherton,
Imperial Tube Works, Wolverhampton;
t & Sons, Ebro Tube Works, Tipton;

Bainbridge & Son, Terminus-road, Eastbourne; sectional huts at Shoreham, McKellar & Westerman, 136, Church-road, Hove; sergeant's messes, etc., at Crowborough, R. Cook & Sons, Crawley; two sets of petrol engines and turbine pumps at A.O.D., Weedon, Pulsometer Engineering Company, Ltd., Nine Elms Works, Reading; shelters and latrines at rifle range, Dreghorn, J. Scott & Brown, 3, Barclay-place, Edinburgh; soldiers' latrine blocks at Glencorse, T. Topping & Co., 52, Dalry-road, Edinburgh; steel buildings at Milton, G. Sands & Sons, Ltd., Colwick, Nottingham; steel buildings at Milton, the Wilfley Company, Ltd., Salisbury House, London-wall, E.C.; store sheds at Didcot, the Wilfley Company, Ltd., Salisbury House, London-wall, E.C.; technical buildings at R.F.C., Castle Bromwich, Birmingham, Jewson & Sons, St. Clements, Norwich; technical buildings at Fort Grange, Gosport, Humphreys, Ltd., 187, Knightsbridge, S.W.; temporary engine-room, etc., at Dunoon, T. Young & Sons, Wellington-place, Dunoon; vehicle shed at Forthside, Watson & Sons, 53, Caledonian-road, Perth.

H.M. Office of Works.

Building Works.—Admiralty, new rooms, Fred Pitcher, Ltd., 133, Marylebone-road, N.W.; Canada House, Kingsway, alterations, William Taylor & Co. (Hammersmith), Ltd., Lower Mall, Hammersmith, W.; Eastcote Camp, alterations and additions, Henry Martin, Ltd., Thenford - street, Northampton; Teddington, research building, John Mowlem & Co., Ltd., Grosvenor Wharf, Westminster, S.W.

Engineering Services.—Heating apparatus, the Thames Bank (Blackfriars) Iron Company, Ltd., Upper Ground-street, S.E.; London Institution, heating, etc., W. G. Cannon & Sons, Ltd., 107, London-road, Southwark, S.E.; Public Offices, Westminster, extension, steam and condense mains, etc., H. J. Cash & Co., Ltd., Caxton House, Westminster, S.W.; Teddington, research building, heating apparatus, E. Deane & Beal, Ltd., 3, Monument-street, E.C.

Miscellaneous.—Addlestone Research Institute, glazed wall tiling, Carter & Co. (London), Ltd., 29, Albert-embankment, S.E.; Public Trustee Office, steel shelving, Estler Bros., South Molton-road, Victoria Docks, E.

Commissioners of Public Works, Ireland.

De Freyne National School, Co. Roscommon, Erection.—Hubert Cassidy, Castlerea.

PROPOSED NEW BUILDINGS AND OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works, at the time of publication, have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; L.G.B. for Local Government Board; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

Aberdeen.—The plan providing for the closing of Kingsland-place in connection with the extension of Broadford Works has been approved by the T.C.

Basingstoke.—At a recent meeting of the B.C. it was decided to widen the road to provide a third approach to the railway-stations. A recommendation was made to erect sanitary conveniences.

Bedford.—Plans passed by the T.C.:—Temporary factory, for Messrs. Wilson & Berry, Ltd., Tavistock-street, 40, Western-street; extensions to smithy, for Messrs. W. H. Allen, Son, & Co., Ltd., Queen's Engineering Works; greenhouse, for Mr. F. W. Brittain, 19, Kingsley-road; lavatories, for Messrs. W. H. Allen, Son, & Co., Ltd., Queen's Engineering Works; shelter for motor-cars, for Corporation of Bedford, Town Hall; alterations and additions, for Co-operative Society, Ltd., Ampthill-road; temporary building, for Messrs. Wilson & Berry, Ltd., Tavistock-street.

Burnley.—A bequest for the erection of an almshouse at Burnley is contained in the will of Mrs. Pamela Parsons, of 37, Guerdon-terrace, Accrington-road, Burnley.

Burton-on-Trent.—A company has purchased a plot of land adjoining the Midland Railway at Horninglow for a factory for the manufacture of bicycle tyres, and building operations are to commence shortly. Fifty acres have been secured in the same area for the erection of other works by an important company.

Canary Islands.—Tenders will be opened by the Municipality of Las Palmas on March 16 for the construction of a slaughterhouse in that city. The estimated cost of the works is 298,095 pesetas (about £12,000). The installation of the necessary machinery, etc., for the slaughterhouse will be put up to tender later.

Chatham.—Instructions have been given to the Surveyor to prepare plans for suitable lavatory accommodation in the cemetery for the T.C.

Coventry.—The R.D.C. has approved the plan of a proposed messroom at the works of the British Chuck and Piston Ring Company, Ltd.

Cowes.—The U.D.C. has aproved a plan of the proposed reconstruction of a house and shop in Bath-road.

Glasgow.—The T.C. of Port Glasgow has under consideration the proposal by Mr. Henry Lithgow, of Messrs. Russell & Co., shipbuilders, to reconstruct the portion of the works of Messrs. Robert Duncan & Co., recently acquired by Messrs. Russell & Co. The T.C. resolved to accept the offer of Messrs. Russell & Co. on the terms mutually agreed upon.

Goole.—A plan for an addition to a classroom at the United Methodist Free Church, Boothferry-road, for the Trustees, has been approved by the U.D.C.

Hendon.—Plans passed by the D.C.:—For new offices and timber drying chambers, as an extension of factory, N.W., near Colindale-avenue and Edgware-road, the Integral Propeller Company, by Messrs. Forsyth & Maule; for alterations to clubhouse, etc., Willifield-green, the Garden Suburb Builders; for water-closet, lavatory, etc., Station-buildings, Finchley-road, Mr. H. A. Welch; for wooden building, side of Congregational Church, Lawrence-street, Mill Hill, Mr. F. Parvin; workshop and offices, London Aerodrome, the Grahame-White Aviation Company; new sewers, etc., at London Aerodrome, the Grahame-White Aviation Company; temporary building for Aviation School, the Grahame-White Aviation Company.

Hexham.—The following plans have been passed by the R.D.C.:—Plans for two semi-detached villas at Allendale, for Mr. Thompson, Low Fell, Gateshead; and for alterations and additions to cottages at Princes-street, Corbridge, for Mr. J. Davidson, builder.

Hitchin.—The following plans have been approved by the R.D.C.:—Alterations and additions to house at Norton, for Mr. W. Haslam Lucas; extension to Three Horse Shoes public-house, Norton, for the People's Refreshment House Association, Ltd.

Hull.—It is the intention to apply the proceeds of the proposed sale of the Church of St. John in Victoria-square, Hull, to the purchase of lands in or near Hull for the erection of a new church and parish hall.

Kingstown.—At a recent meeting of the U.D.C. plans of the artisans' dwellings on the Brooklawn and Callaghan's-lane sites were ordered to be forwarded to the L.G.B., with applications for the sanction of loans amounting to £24,360.

Langport.—The R.D.C. has approved plans of a new house, for Mr. W. E. Knapp, in Windmill-lane, Huish Episcopi.

London.—The chairman of the South Eastern and Chatham Railway Managing Committee has stated that to make full use of Charing Cross station a stronger bridge is wanted. It has been proposed to throw another bridge over the Thames 57 ft. wide, and this plan was approved. The L.C.C. has given consent to the erection of a building in Hawker-street, Peckham, S.E., for Messrs. Tucker, Webster, & Co. The Council has approved plans in connection with the proposed installation of escalators at the Stockwell Station of the City and South London Railway so far as the work affects the Putney, Wandsworth, and Clapham relief sewer (extension to Vauxhall). Under the provisions of the Metropolis Management (Thames River Prevention of Floods) Amendment Act, 1879, the L.C.C. has approved plans submitted in respect of flood-preventing works at the undermentioned premises:—Battersea Flour Mills, Church-road; Hallett's Wharf, Rotherhithe-street; Battersea Works, Church-road. The L.C.C. has sanctioned the construction or reconstruction, within metropolitan boroughs, of local sewers as follows:—Bermondsey, 110 ft. of 9-in. sewer between Truscott-court and Gainsford-street; Westminster, 50 ft. of 15-in. sewer in the Haymarket, opposite Orange-street; Woolwich, 440 ft. of 9-in. sewer in Lannoy-road, New Eltham; 1,470 ft. of 9-in. sewer in Crookston-road (east and west of Glenesk-road); 1,130 ft. of 9-in. sewer in Dairsie-road (east of Glenesk-road); 1,180 ft. of 21-in. sewer in

Loughton.—The U.D.C. has approved amended plan for an extension of workshops Messrs. Warriner & Son.

Middleton.—At a recent meeting of the Mr. L. Simpson presented plans and speci tions for a new girder bridge on the old and it was resolved to ascertain from the if they would be prepared to assist in the erect of a new bridge.

Neston (Cheshire).—The D.C. has appro plans for house and farm buildings at the Lane Ends, for Mr. Hy. C. Peers.

Perthshire.—It is proposed to establish garden village in Perthshire for the training employment of county soldiers who may partially or permanently disabled.

Ruislip-Northwood.—The U.D.C. has appro the following plans:—House near Nort Junction, for Mr. D. Duncan, submitted by H. C. Lawrence; garage in Murray-road, for G. Kingsley, submitted by Messrs. Swannel Sly.

Selby.—At a recent meeting of the U.D. resolution was adopted that, subject to L.G.B. sanctioning the necessary loans, Council proceed to build 100 houses. It decided that the Surveyor prepare plans for first batch of thirty-four houses, and that L.G.B. be asked to give immediate sanction the purchase of the land.

Sheerness.—Sanction has been given for p for a garage in Wood-street, for Mr. A. H phrey, and for a temporary wooden shed in playground of Holy Trinity Schools, for Co-operative Society.

Southend.—At a recent meeting of the T.C. following plans were approved: Additi "Rookwood," Marguerite-drive, Mr. A. Sanders; alterations and additions, 41, Mar parade, Mr. L. Greenwood; two houses, Elect avenue, Mr. T. J. Dennis; two bungalows, No view-drive, Mr. H. Bridge. The Borough veyor presented a plan showing prelimin proposals for the development and extension certain of the main and subsidiary roads in area of the North-West Town-planning Sche The plan was approved, and the Borough veyor was directed to make inquiries with a to the inclusion of the proposals in the sch for this area. The Borough Surveyor was directed to report upon the question of includ other portions of the borough in a town-plann scheme.

South Wales.—According to the designs of W. D. Caröe, Master of the Plumbers' Compa new churches are about to be erected at Torq and Loughor in South Wales.

Swansea.—At a recent meeting of the Council the Estate Agent reported upon correspondence and interviews between chairman, himself, and Mr. S. R. Crocker, ar tect, acting on behalf of a syndicate who w desirous of renting the two plots of land Worcester-place to the Corporation, with in vening land of the Duke of Beaufort, for purpose of erecting a cinema.

Tilbury.—The L.G.B., with the sanction the Treasury, have authorised the U.D.C. proceed with the immediate provision of houses.

Tring.—At a recent meeting of the U.D the Building Committee submitted and rec mended for approval plans for a cinematogr theatre in Western-road, a soldiers' room Christchurch-road, a garage in Akeman-st for Mr. Rodwell, and a cinematograph theatr Akeman-street.

Weymouth.—Plans passed by the T.C. Plans submitted by Messrs. Theo. Conway, L for alterations to brewery of Messrs. J Groves & Sons, Ltd.; submitted by Mr. Jackson, for alterations to No. 12, Cove-str for Mr. W. C. Talbot; amended plan, s mitted by Mr. S. Jackson, for alterations No. 3, Coburg-place, for the Wilton Esta submitted by Messrs. Crickmay & Sons. proposed alterations to the Gloucester Ho submitted by Mr. John Barrow, for propo alterations to shed at No. 21, Emmadale-road

PROPERTIES OF LIMES AND PLASTERS.—III.

the purpose of this article to deal with imes which possess hydraulic properties, ntrasted with those prepared from ally pure carbonate of lime or containing ition only magnesia and material which inert in the burning and setting ses.

special character of hydraulic lime s upon somewhat complex chemical both in production and use, which must plained. Most limestones contain, in n to carbonate of lime, silica SiO_2 a Al_2O_3, and often iron oxide Fe_2O_3.

when these ingredients are not evenly inated, or when the temperature on g is unsuitable, the resulting product is a poor or lean lime in which the ents act solely as inert diluting matter; nder favourable conditions part of the nd alumina combine with part of the n burning to form silicate and aluminate e compounds, which break up on the n of water and recrystallise, and thus conferring considerable strength on the esulting solid (the mortar). It is these then, which give the hydraulic properties e limes. Strictly speaking, it is perhaps wholly the silica upon which hydrau- turns, the alumina and iron being very ary, but at the same time the former v is important, inasmuch as when ed with lime it breaks up more readily addition of water than does the silica und, which is thus itself subjected to ion and brought into a condition of ility for the action of water and process ing. The composition of this silicate is not agreed upon, for, though most regard it as (3 CaO) SiO_2, there appears good evidence in favour of accepting mula (2 CaO) SiO_2. This matter, of has considerable significance in g the proportion of lime to silica in hydraulic limestones in reference to .

lime silicate is the essential ingredient cements, both natural and artificial, set by the breaking up and recrystallisa- this body with water in exactly the anner as hydraulic limes, the difference n the two being that cements are ntially composed of this compound, must be very finely ground to enable o act upon it, whereas the limes contain tion a large quantity of lime in excess, slakes on the addition of water, and by lence of this action breaks up the silicate us removes the necessity for the costly g process. This function discharged, ee lime merely dilutes the effective ing power of the material, hence the ydraulic limes are much inferior to s. A careful study of the above ions is necessary to give a clear con- of the relations between fat limes, ic limes, and cements. If we could a cement the lumps of which were hly incorporated with free lime particles mixture would be a hydraulic lime. ss of material then is a true intermediate etween common lime and cement.

re knows no sudden breaks in her of materials, and hydraulic limes are ranging from those but little removed t lime to those containing when burnt imum amount of free lime necessary k up the silicate and aluminates. y, however, this class may be divided o groups—the feebly hydraulic and ly hydraulic limes. What is known as lime" is a feebly hydraulic lime, and king and Merstham limes are examples class, while the Holleywell and Lyme arieties (the latter perhaps the most c in this country) are instances of the ly hydraulic class.

ydraulic limes are burnt in stationary milar in general principles of construc- those used for common lime burning; temperature attained must be much reaching 1,000 deg. C. to even g. C. (above the melting-point of cast- the proper combination between the e and the silica after expulsion of the carbonic acid gas is to be obtained. The best limestones for these limes contain 70–80 per cent. of carbonate of lime, 13–17 per cent. of silica, and 1–6 per cent. of alumina and iron oxide.

When hydraulic limes are slaked with sufficient water to disintegrate the lumps, certain nodules remain which contain so little free lime that they refuse to break up by this treatment. They are in effect lumps of cement, being chiefly composed of silicate of lime and alumina, though always containing some quantity of inert material. These lumps are known as grappiers, and are removed and ground in the same manner as cements. They form a valuable cement, less strong than Portland but superior to hydraulic lime, and are particularly useful for setting stonework, which they do not stain. Care, however, is required in their selection, as if a hydraulic lime is insufficiently burnt these lumps, instead of consisting of lime silicate, will be mostly composed of worthless inert matter, in which the original stone will predominate.

Le Chatelier gives the composition to be looked for in a grappier cement as lime CaO, 63 per cent.; silica (SiO_2), 26·5 per cent; iron oxide (Fe_2O_3), 1·5 per cent.; magnesia (MgO), 1 per cent.; carbon dioxide (CO_2), 5 per cent., from which typical analysis the character of any sample proposed for use may be in some measure judged.

As regards strength no recognised standards exist for hydraulic lime similar to those demanded for Portland cement. Good hydraulic limes have a specific gravity about 2·9 and grappiers about 2·7 as against 3·1 for Portland cement, and in tensile strength range from 100 to 400 or 500 lb. per square inch.

In the case of feebly hydraulic limes a very considerable increase in strength can be conferred by the process known as "selenitising," which consists of the addition of about 5 per cent. of sulphate of lime, which may be effected by the action of sulphuric acid on a portion of the lime, or more usually by the addition of plaster of paris to the ground lime, with thorough subsequent mixing. These limes are largely used for plaster, but that they deserve further consideration for mortar has been proved by experiments upon their strength by Kirkcaldy, in which the strength of given mortars of feebly hydraulic lime and sand showing only 24 lb. in tension, 122 lb. in compression, and 8 lb. in tension as a joint between bricks per square inch was increased to 64 lb., 285 lb., and 17 lb. respectively when selenitised, notwithstanding that the proportion of sand was somewhat increased. These data are a summary of a number of experiments on various mixtures. The better classes of hydraulic limes do not repay the cost of selenitising.

THE INSTITUTE OF BRITISH DECORATORS.

A MEETING of the Incorporated Institute of British Decorators was held at Painters' Hall, Little Trinity-lane, E.C., on Tuesday, the 8th inst., when a paper was read on "The Legitimate Use of Imitations" by Mr. Godfrey Giles, F.I.B.D. In the course of his remarks the author said:—

"Decoration, I believe, means essentially putting things in order, arranging things in accordance with the requirements of those who use them, and in agreement with the physical qualities of the things dealt with. It means putting things as they should be. After some disarrangements or decay or damage, or even ordinary wear and tear in a house, a certain amount of restoration or redecoration is necessary. So decoration covers the whole field of the completion and maintenance of a building, and, of course, the greatest part of the work of a decorator is the repair or renewal of the internal surfaces of buildings. These surfaces are almost always formed of plaster, and it comparatively rarely happens that any change of form is required. The decorator's work must consist of efforts to apply texture and colour to these surfaces.

I said just now "comparatively rarely," because in the majority of cases the plaster is left as it is, and merely painted and papered; but in some cases, of course, mouldings, plain or enriched, are applied to the walls, consisting of wood or fibrous plaster to form panels in the Adams, Louis XVI., Georgian, or other styles, and dado rails applied to form dados, etc.

Where is the decorator to go for inspiration if he is not to imitate something? If he paints anything white he unconsciously perhaps produces the appearance of white marble or ivory; if he uses large surfaces of single colours he may give something of the effect of hanging cloth or tapestry.

When a decorator uses wallpapers, either with or without patterns, he very often either unconsciously or intentionally imitates something. This remark—that is to say, as regards unconsciously—applies more particularly to persons who practise as decorators, but who really are not, in the true and professional sense of the word, for a decorator properly qualified and experienced knows perfectly well what effects he will produce or how to produce an effect he requires.

This knowledge is very essential when handling wallpapers, and I consider the "imitation" the decorator effects perfectly legitimate when carried out with knowledge and skill, so that the imitation is really a good one, and produces as nearly as possible the artistic effect of the real article.

Take, for instance, a leather paper. If a person cannot afford to have a hall, library, or billiard-room hung with real leather a good imitation carried out well will give a pleasing and artistic effect as long as the remainder of the work in the room is treated in keeping with the particular kind of wall treatment in use.

I show a so-called leather paper which I do not consider it legitimate to use. The imitation is too bad. When hung it does not suggest the effect or surface of leather, and in practice I have always refused to consent to the use of such a paper in rooms I have been entrusted with. Imagine this paper in a room with white paint; the result is neither pleasing nor pretty, certainly not artistic, and therefore in my opinion not legitimate.

Some papers imitate canvas or jute, some tapestries; some plain cloth, such as flock paper; some represent cretonne.

My remarks in regard to the leather imitation apply exactly to these imitations of canvas, tapestries, cloths, cretonnes, etc.

If the imitation is good and well carried out by the decorator, the imitation will surely give a good result; if not well carried out it is not legitimate and becomes meaningless.

If one were hanging a real cloth, tapestry, or silk, or in fact any fabric, it would be tacked to the wall and finished off with a border, or braid, or gimp. Therefore the papered wall should be treated in exactly the same way, using a paper border representing a braid or gimp to hide the imaginary tacks. If not, paper the walls in a manner so as not to imitate any of these things.

Some wallpapers imitate tiles, marbles, woods, or stone. I think the majority of tile papers are bad imitations, and therefore not legitimate—a varnished paper not imitating anything is better.

We may and must use imitation in decorating London houses; but there is surely room for wisdom in selection of the subjects or materials imitated. Let us try to put as much meaning as possible into our work, and have reasons for what we do as far as possible. If velvets or brocades are copied in wallpapers, let them be used as the real materials would be used. If marble papers are used, let them be put where real marble would not be out of place. The imitation should always be applied in the way or for the purpose the real article would have been used.

To give a few other instances of imitation which are legitimate, and illustrate the numerous methods decorators adopt to obtain effects or results, take walls plated with marble—they are only marble on the surface: the marble may be, or is, the real thing, but has the appearance of solid marble construction.

Walls covered with wood panelling are not walls formed of panelling, such as they appear to be, although the panelling is, of course, not in itself an imitation.

If gold leaf is used in decoration, particularly when used in a bold broad manner, such as gilding in solid the capitals, mouldings, or bases of columns, there is the effect of solid gold; it is an imitation and not the real thing.

We cannot escape imitation in our work. An attempt to do so may be made when a new house is being built, but think what it would mean!

If walls are built of brick, then the bricks must appear; they must not be covered with plaster or any kind of paint or polish, unless one is used which has only the effect of adding durability to an already sufficiently durable surface, that is more easily kept clean than its natural surface. I have seen a house where the brickwork has been left exposed, not plastered or treated in any way, and good decorative effect has been obtained by the use of brick mouldings and the bricks themselves being laid at different angles, but think of the cost of such work! It has to be most beautifully executed and most carefully finished. I know a church, the interior simply being left in red brickwork; there the work was perfectly plain, merely pointed, and to my mind not pleasing, because of its unfinished appearance.

Any alteration of colour that ensues must be accepted without modification or reconsideration if we are to avoid imitation; for, if we modify the colour intentionally, we shall certainly be likely to match some more beautiful material, and so suggest vast quantities of emeralds, amber, rubies, and sapphires that do not exist. We cannot avoid imitation, and need not try to.

The foolish condemnation of marbling and graining that novices and amateurs so frequently have expressed is inexpert and insincere. It generally results from want of knowledge, through not having seen such work well done."

LAW REPORTS.

CHANCERY DIVISION.

(Before Mr. Justice NEVILLE.)

Dispute as to the Footings of a Wall: Alleged Contempt of Court by Solicitor.

Webster *v.* Bakewell Urban District Council.

IN this case, heard on the 11th inst., the plaintiff moved the Court to commit a Mr. Taylor, a solicitor, for alleged contempt of Court for sending letters to him (plaintiff) since the commencement of the action, containing threats calculated to deter the plaintiff from prosecuting the action, and containing matter with a view to interfere with the exercise by the plaintiff of his legal rights, and so prevent the due administration of justice between the parties to the action.

The short facts of the case were these:—

The plaintiff brought the action for a declaration that the defendant Council were not entitled to cut away or remove the roadside bank and footings of the wall of a cottage between Bakewell and Birchover within the defendant's district, and of which cottage and garden the plaintiff was a yearly tenant at a rent of £4 10s. The writ in the action came to the knowledge of the tenant for life of the Stanton Estates (of which the cottage and garden formed part) about January 10, and thereupon her solicitor, Mr. Taylor, by her instructions, wrote to the plaintiff requesting him to discontinue the action. Plaintiff handed that letter to his solicitors, but did not discontinue the action. On January 17 Mr. Taylor wrote to plaintiff to the effect that the tenant for life was determined that the action should not go forward, and that she was anxious to stop it with as little inconvenience to anybody as possible, and stating that his client would have no hesitation in turning the plaintiff out of the cottage so as to place him in such a position that he would have no *locus standi* in the matter if her wishes were not carried out. Mr. Taylor, however, said he hoped that Mr. Webster would not drive his client to take that course.

Mr. C. E. Jenkins, K.C., and Mr. Whitmore Richards appeared in support of the motion; and Mr. Ward Coldridge, K.C., and Mr. J. M. Stom for Mr. Taylor.

At the conclusion of the arguments in support of the motion, and without calling upon counsel for Mr. Taylor, Mr. Justice Neville held that the letter in question did not constitute a contempt of Court. The object of determining the plaintiff's tenancy was to prevent him from continuing the action to the detriment of the interests of the tenant for life, and there was nothing to prevent the lady protecting her rights in that way. He accordingly dismissed the motion, with costs.

Mignott *v.* Thomlinson: Landlord Sued for Negligence.

THIS action, which was tried by Mr. Justice Coleridge with a special jury, was a claim by Mrs. Mignott for damages for injuries caused by falling upon the forecourt of premises in High-road, Leytonstone, owned by the defendant but occupied by his tenant.

Mr. P. Hastings appeared for the plaintiff and Mr. Stuart Bevan and Mr. Harry Geen for the defendant.

The plaintiff stated that on December 9, 1912, as she was walking along the space in front of the shops owned by the defendant at about eleven o'clock on a stormy night, she fell through catching her foot in a hole in the York-stone paving and sustained injuries which required attention at the hospital. She said that the forecourt was about 8 ft. wide upon the same level, and unfenced from the public footpath, and that a hole, which she estimated to be about 18 in. long, 9 in. wide, and 10 in. deep, was left unprotected in the pavement of the forecourt about 2 ft. from the shop-front.

At the close of the plaintiff's case it was submitted for the defendant that no evidence had been given that the defendant had had notice of any want of repair; that he was not responsible, but the occupier, if any unprotected "trap" had been left upon the premises; and that as landlord he was not liable for any defect which was not there when he let the premises to his tenant.

His Lordship reserved the point of law, but for the purposes of sending the case to the jury held that it might have been of advantage to the landlord in letting his premises that the public should have access to the shop over what was originally a garden but now an open forecourt, and that if any negligence was proved against the landlord he would be liable.

The defendant said that he lived at Four Marks, Hampshire, and visited the property occasionally. He had had no notice of any defects in the forecourt, but on receiving an intimation of an accident to Mrs. Mignott he visited the place and found a slight depression in the pavement caused by a cracked paving flag. He, however, thought that no accident could have arisen from that, and as Mrs. Mignott's solicitors wrote claiming compensation for her broken arm, he ignored the whole matter, as he was convinced no such accident had taken place.

Mrs. Crease, who said that she had been tenant of the premises for thirty years, knew of no such hole in the forecourt as the plaintiff had described, but there was a slight depression about the size of a tea saucer close up to the shop-front which a few months ago she herself filled in with a halfpenny worth of cement which she bought in order to prevent children playing with the water which accumulated there.

His Lordship, in summing up, said it was strange that such a hole as the plaintiff had described had not been seen by anyone else, and more strange still, there having been great delay in bringing the action, that in the meanwhile no one else had fallen because of it: the plaintiff had probably exaggerated the size of the hole, as she had done in the case of her injuries, which were first described as a broken arm, but which were afterwards reduced to a severe sprain.

The jury returned a verdict for the defendant, and judgment was entered accordingly.

RAILWAY AND CANAL COMMISSIONERS' COURT.

(Before Mr. Justice LUSH, Mr. GATHORNE HARDY, and Sir J. WOODHOUSE.)

Postmaster-General *v.* Hutchings: Telephones on Building Estate.

THIS case, which raised the question of the rights of the Postmaster-General in regard to the laying of telephone wires and the erection of poles upon a building estate, was heard on Monday, February 7. The respondent was Mr. A. B. Hutchings, the owner of the Sutton Estate at Seaford, in Sussex, which he had laid out for building purposes, and which is intersected by roads, some of which are not yet
built upon, and he sought to uphold a decis
of the local County Court Judge that
Postmaster-General should pay him a rental
£5 a year for the privilege of placing teleph
poles and wires upon certain parts of the ro
a decision to which the Postmaster-Gen
objected.

Mr. H. Murphy, appearing for the P
master-General, said that the matter ca
before the Court by way of a reference un
sect. 4 of the Telegraphs Act of 1878
reference arising out of a difference betw
the Postmaster-General and Mr. Hutchi
relative to the laying of telephone wires u
the Sutton Estate, which was laid out for bu
ing purposes. The estate was partly develo
and was traversed by a number of roads wh
had not yet been adopted by the lo
authorities, although all of them were used
the public. On the estate there were a num
of poles and wires which were originally
there by the National Telephone Company,
paid for them a rental of three guineas a y
When the telephones were taken over by
Post Office the rental was continued in resp
of those wires and poles which were on priv
property, but they objected to paying for th
which were on the public roads. The P
master-General sought to place certain und
ground lines along certain roads, in all ab
¾ mile, and to place three poles in differ
positions for the purpose of radiating the w
to different houses on the estate. For th
three posts Mr. Hutchings claimed a rental
£5 a year; but the Postmaster-General objec
on the ground that they were on public ro

Mr. Boyd Archibald Miller, Surveyor to
Seaford Urban District Council, gave evide
to the effect that the roads were used as pu
roads.

Mr. Hutchings, who conducted his case
person, disputed this, his argument being
the roads were made and maintained by h
He admitted, however, in reply to questi
put by the Judge, that the roads were used
the public for vehicular as well as
pedestrian traffic.

The Court held that the roads were clea
public roads.

Mr. Murphy said that the Postmaster-Gen
was willing to continue to pay a rental of th
guineas a year for poles and wires which
on private property, but not for those on
roads. The Postmaster-General sought to p
certain underground lines along some of
roads, the effect of which would be to red
the number of overhead wires: but
respondent objected to this. In answer t
complaint as to the size and unsightlines
the poles, he said that the Postmaster-Gen
would agree to put up ornamental poles.

Mr. Justice Lush, in giving judgment,
that the roads being public roads, not ta
over by the local authorities, Mr. Hutch
was still the owner of the soil, and therefo
person within the meaning of the Telegra
Act who was entitled to withhold his con
to the placing of poles on the roads. The
master-General, desiring to erect poles
place wires under the streets, made applica
to Mr. Hutchings for his consent, which
would not give. The matter went before
local County Court Judge, who decided
the consent ought to be given, but that
Hutchings ought to be paid a rental of £
year. The Postmaster-General objected
the payment, and brought the matter to
Court. It was clear that in dealing with
application the Court must regard Mr. H
ings, not in his capacity of owner of the ad
ing land, but as the owner of the soil of
road dedicated to the public. If Mr. Hutch
should suffer any damage as the owner of
land, the Act provided in clear terms for
compensation. It was a very unusual thing
a County Court Judge to say that a r
should be paid to the owner of a street
appeared to the Court that it was inconsi
that he should be given a rental for that w
did not affect his proprietary interest. T
was no ground for saying that the Postma
General should pay a rental to the own
the soil of a public road. If Mr. Hutch
could show that, in his capacity of owner o
soil of the road, he would be put to any exp
or damage, it would be right to safeguard
The Postmaster-General, however, would
good any damage, so that respondent w
suffer no pecuniary loss by the erection o
poles. Every possible provision would be
by the Postmaster-General to safeguard
Hutchings against having his roads mad
sightly. The Court had therefore come t
conclusion that the condition imposed by
County Court Judge ought never to have
imposed, and that the Postmaster-Ge
ought to be relieved from it, and consent
to the application.

List of Competitions, Contracts, etc.

For some contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, —; Contracts, iv., vi., viii.; Public Appointments, —; Auction Sales, xxii. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

*** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Contracts.

BUILDING AND PAINTING.

he date given at the commencement of each ragraph is the latest date when the tender, or names of those willing to submit tenders, y be sent in.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to THE BUILDER LTD., and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

THE BUILDER

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

OL. CX.—No. 3813.

MARCH 3, 1916.

IS WAR GOOD FOR ARCHITECTURE?

WHEN the war was but a few weeks old one of our senior architects, in addressing certain younger members and students of the profession, told them that "war was good for art." He evidently desired to signify that art of architecture was specially included in the maxim, and ffered it as a cheering promise held out to architects by ageddon. The note he struck was one of stalwart mism. "Bear up, brothers!" he said in effect. "War may terrible thing, but—be of good cheer: it is good for itecture." He was supported by another eminent exponent e art of building, who held out this same message of hope independent idea for which he took personal responsibility, the precept may therefore be supposed to be rooted in the er wisdom that trims the sails and directs the course of itectural taste. To what extent the apothegm nourished young men who on such occasions are supposed to sit with ls held open to receive what is put into them is beyond ecture, but the question raised is of some interest.

t is evident that the speaker referred to the art of itecture, and not by any means to the profession, for that d have been a fatuous commonplace, true indeed, but true out wisdom or even good sense. A man might with as h weight say that "war was good for agriculture," having ind that it broke up and manured the land. It is obvious war which knocks down buildings and lays architects in the may be crudely said to benefit a profession which thrives e there are many buildings to design and few architects sign them. This was certainly not the speaker's meaning. t he intended to convey, of course, was that war is good he art of architecture, because it reacts on national ideals emotions, rendered stale by the *ennui* of prosperity, and s about changes of feeling which conduce to an epoch of expression in art. War, in his opinion, purges the *blasé*, c sentiments of a people and re-establishes a more itive, and therefore a more wholesome and vigorous, ional sense.

ut what does all this amount to? A revolutionary change tional concepts would certainly not help the established tect to an enlargement of his attainments or lift him to a r plane of achievement. Such readjustment of public would rather spell disaster for any man who has outlived eceptive years of his life. It is clear that the speaker did uppose that war was going to benefit him or his contem- ies, for he would realise that it would thrust him into rity by bringing into discredit the whole system of ideas hich he had learned to express himself. It would set up tem to which he was a stranger. He would lose foothold be compelled, at the sedate climacteric, and burdened the mental habits of half a century, to clamber to a new ence from which to proclaim himself. Othello's occupation d be gone!

or could the speaker suppose he was offering any very arating prospects to the young men whom he addressed. young men could hardly be expected to look forward glad anticipations to a future in which their convictions d become a heresy and their aspirations a staled memory. , too, would expect to suffer in proportion as his attain- s were great or small. The more each had acquired by and industry the more he would have to discard; the steadfast the enthusiasm of each the more difficult his nment under the new order. In the *mêlée* of readjustment ho had the least to divest himself of would be the first off nark and the lightest burdened. The race he was engaged in would be stopped in mid-course, and the runners turned about towards a new winning-post from which the leaders would be furthest removed. The first would be last and the last first. This is not a proposal likely to fire the hopes of runners who have embarked in a race with intention of keeping a good place in it, and such runners are the only sort worth talking about.

The above considerations make it clear that the speaker desired to convey by his maxim that the changes in our national life, sentiment, social codes, fashions, ideals, ethics, and religious temper, brought about by stress of war, are such as conduce to the upraising of "schools" of art which are marked by posterity as constituting great epochs. It does not, however, appear that even this exalted conception is such as could be expected to fire the ambition or soothe the perturbations of the most steadfast prig in any audience of young men. Art and unction have been kept apart, and rightly so, ever since Ruskin showed how they can disport themselves when in leash; and of all those unmanly qualities of which war is destructive surely unctuousness is the most vulnerable. The prig is an exotic blooming in an emasculated civilisation. He is a counterblast to degeneracy, and that is the best that can be said for him. Social perversions manure his roots and keep him in blossom. The thing that fires the aspirations of the artist is not flummery about the dignity of art or the mission of the artist, but the passionate desire of a man who is more keenly and feelingly alive than his fellows to express himself supremely, here and now. He craves the power and the will to so excel and the luck to succeed, and the man who does so excel, whether he finds success or not, is *ipso facto* a great artist of his own time. Whether he is to be a great artist of any other time will not trouble him; but unless he is a great artist of his own age—a man who reflects his environment, and whose art reacts or comments on the sentiments and moods of the times in which he lives—he will assuredly be esteemed a great artist in no age at all. He will be regarded as a crank while he lives and a cipher when he is dead. A man indeed cannot get away from the associations of his time; he could as easily get out of his skin, and his contemporaries cannot gauge his merits except through the mist of prejudices of thought and feeling which enshroud both them and him alike. They cannot see his work in the perspective of the future. Moreover, an artist is no more responsible for the subtle quality of personality which makes his creations esteemed of posterity than he is accountable for the shape of his ears; and an artist, or group of artists, can no more hope to consciously build up a great school of art than a farmer, or a syndicate of farmers, can bring about a good year for turnips. No architect, however well backed up by war, could survive the enervating consequences of being taught that he was embarking upon the upraising of a great art, which is the first lesson in the first page of the first chapter of the prig's text-book. It is stimulating to look back on history and recall how many of the world's masters in the arts worked in poverty and distress. They had, in necessity, a better motive than duty to their art. They did not work to meet the calls of a system of expression; they worked to meet the calls of landlord.

It was Ruskin, in the "Crown of Wild Olives," who in his overwhelming, dogmatic, and entrancing manner laid down, and first popularly laid down, that on a wide survey of history "you *must* have war to produce art." "As peace is established or extended in Europe the arts decline." "Peace and the *vices* of civil life only flourish together." "The words that the Muse of History couples together are—peace and sensuality—

peace and selfishness—peace and death." This teaching has been disposed of more or less satisfactorily by writers who have shown that there has never been such a cessation of war as would warrant a conclusive observation. The history of Europe has been the history of phases of war; its waxing and waning; its recuperations and preparations. The subject is too large to discuss here, and the question, "Will the present war be good for architecture?" is on entirely another plane. To introduce the idea that war should set us cogitating oursel for the revelation of a great art is to take a step towa re-establishing that very system of unwholesome, mawk introspection which it is the good office of war, if it has a good offices, to discredit and wipe out. To inculcate such id is to encourage architects to follow the example of th philosophers of whom Carlyle said that they sought apocalypse of nature in the study of their own navels.

◆

NOTES.

Charing Cross Bridge.

We are glad to read in the *Times* a protest signed by Mr. Ernest Newton, as President of the Royal Institute of British Architects, and Sir Aston Webb, as Chairman of Council London Society, protesting against the adoption of the South-Eastern Railway Company's proposal to strengthen one-half of Charing Cross Bridge by casing the existing piers with stonework. It is pointed out that the work will add nothing to the much-needed accommodation for road traffic across the river at Charing Cross, and will tend to prolong the existence of the present unsightly bridge for an indefinite period. Though the work is not to be undertaken until the termination of the war, it is feared that if the railway company obtain powers the work may be put in hand without adequate discussion. A strong case may be made out for the removal of the station to the southern side of the river, apart from which the whole scheme appears to be a piece of unsatisfactory patchwork which neither from a constructional nor æsthetic standpoint will meet with approval from those who have considered the problem. The removal of the station and the building of a really fine bridge at this point approached from Trafalgar-square would be a scheme which would commend itself to all as a fine memorial of the present epoch in our history.

Economy in Public Services.

The Press gives indications of the manner in which the Government proposes to promote economy, over which the *Observer* indulges in a little stately mirth. We learn that the expense of a periodical search for conspirators in the vaults of the Houses of Parliament by the aid of lanterns is to be discontinued, and that stationery supplies are to be cut down by the substitution of half for whole sheets of paper and even by a saving in the cost of envelopes! Further, we know that museums are to be closed, that children under five are not to be admitted to schools except in special cases, that powers should be obtained to *enable Old Age Pensions to be temporarily suspended when the pensioners' means are increased above the statutory limit*, but only, it is stated, *temporarily*. We wonder why? We do not suggest that these and other economies are not altogether praiseworthy, and that by an indefinite multiplication of such items it may be possible to pay the expenses of the war for two days, but we think that the greatest of all economies now and in the future is probably to be found in employing the right men in the right places, in spite of time-honoured precedent to the contrary. It is said by some extremists that architects know more about the design and construction of buildings than eminent Royal Engineers, and that they might do more service to the State in doing work they understand than in becoming ordinary munition workers. Still, it is possible that they are wrong, and that the general public should employ engineers as architects, and perhaps discover the architects' real *forte* to be horticulture or laundry-work. Many Gilbertian positions have arisen in our midst the literary treatment of which should form a fruitful theme for future novelists.

The Lady Architect Again.

The pages of the *Bystander* contain an eloquent plea for the lady architect and a vigorous denunciation of the sins of the ordinary men who fail so pitifully in that capacity. Why, it is asked, is woman, who lives most of her time in houses, which are shockingly planned by man, not to have any room she may call her own? The man has his dressing-room and his study all to himself; while woman is only allowed an uncertain share of the common rooms of the house. The article is illustrated, not with plans of an ideal house, or even diagrams showing the errors made by man in his planning, but by figure studies which, though charming, are scarcely germane to the subject. We have that hardy perennial complaint of the absence of cupboards which, until she comes to plan, the woman imagines take up no space and cost nothing at all. There is a great opportunity which the pioneers of the woman's movement might seize at the end of the war. Why not have a garden city laid out by women, its houses built by women, and its finances organised by women? In such a city truly we might be a little nearer Heaven than elsewhere; in such a city every house might be a ha of refuge. No chimney would smoke, no draughts be felt; we sho be surrounded with cupboards in every room; all windows wo look due south except the kitchen and larder; all windows wo have the best views. The rates might indeed be high, as s houses, though economical to build—for nothing would be forgotten overlooked—would be so much sought after that rents and ra would rise, unless indeed the syndicate removed that difficulty wise enactments. The only drawback would be the nuisance cau by the remaining men architects—the last of an evil generation—w would be always measuring and sketching in the vicinity.

Germany at Work.

Mr. Joseph Pennell sees, like all great artists, bea in the modern development of science, and at Leicester Galleries the exhibition of drawings a lithographs serves as a reminder to all of us of wonders of the age in which we are living. The view of "Vul Shipbuilding Yard" (No. 9) shows a great steel-framed shed of wh Mr. Pennell says: "As beautiful as the wooden roof of a cathedra quite as difficult to draw and much more exciting." While the "Gas Works at Berlin" he writes:—"The gasometers built inside the great castles, and so become picturesque instead eyesores." We admit the picturesqueness, but question whet the *raison d'être* of the construction can be defended any more th that of the Tower Bridge. "Building the Bridge, Cologne," is of the most vivid and arresting of a very fine series of drawin while two views of Leipzig Station, now under construction, fo magnificent subjects for Mr. Pennell's skill. He compares Engl architecture—which "looks all alike"—and American buildings which "look like Greek temples"—unfavourably with Germ buildings—which "look what they are." We think that the ha of sketching buildings under construction possibly prevents artist from giving due weight to their value when completed, wh is where German work usually fails. Another very fine subject is t "Building of Bismarck No. I., Hamburg"—a view of the gigan ship end on, with an immense crane over it. All should make point of visiting the exhibition, which gives an impression both Mr. Pennell's skill and the world of energy and purpose which behind Germany. In the same galleries is included an exhibition the delightful work of Mr. George Wetherbee, R.O.I. His pictu are full of warm mellow colour and atmosphere, and it is diffic to pick out examples where all reach so high a standard. Perha we may say that No. 29 ("Where Virgil Sang"), No. 7 ("The Da Hill"), and No. 25 ("A Veiled Sunset") were among the pictu which pleased us best.

A Great Londoner.

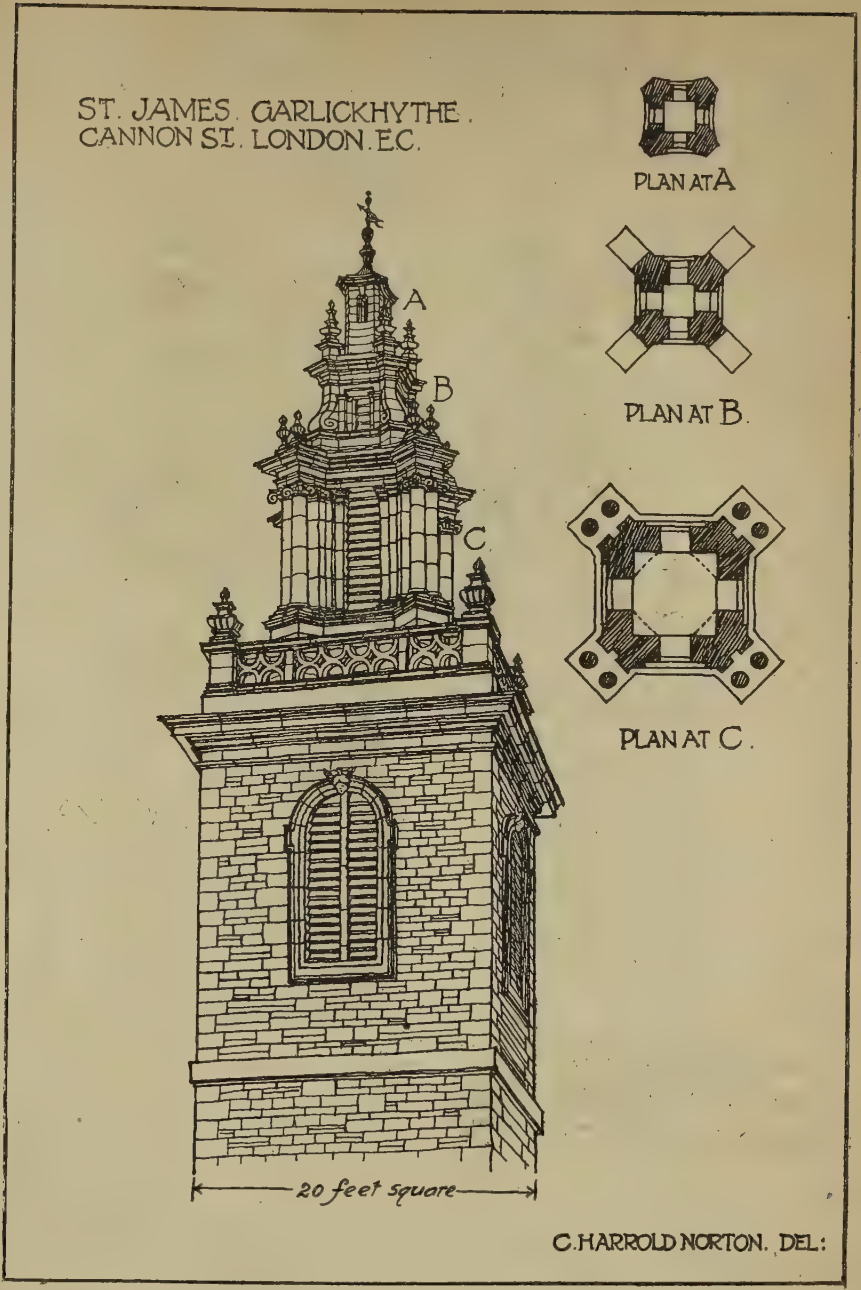
By the death of Sir Laurence Gomme London los one of her most prominent citizens, a personal closely connected with the pioneer work of London County Council—the first real expression the determination to make the metropolis something better than agglomeration of local vestries presided over by that mysteri body, the Metropolitan Board of Works. Sir Laurence Gomm ambition was that the Council should become the most perf example of municipal administration in the kingdom, and he devot all his powers of organisation to that end. In common with that Mr. Riley, his name will be remembered for the pioneer services has rendered to the great new municipality and its ever-extendi requirements, and to the clear grasp of broad principles by the rec nition of which alone order could be evoked out of chaos. The act period during which he held the office of Clerk to the Council fourteen years, from 1900 to 1914; but his whole working career spent in the service of the Metropolitan Board of Works and London County Council, and his hours of recreation were larg taken up with studies bearing on the history and associations of city in which he took such pride. Every movement for the preser tion of historic London and the betterment of new London found him a strong supporter, while his literary bent was evidenced in editing of the *Antiquary*, the *Archæological Review*, and the *Folkl Review*. He founded the Folklore Society, and was the aut of many works on folklore and other antiquarian subjects. personality was singularly winning, and his loss will be felt by a v large circle of frends as well as by the Council of which he was long so distinguished a servant, but many now living have be inspired by the example of his energy and enthusiasm.

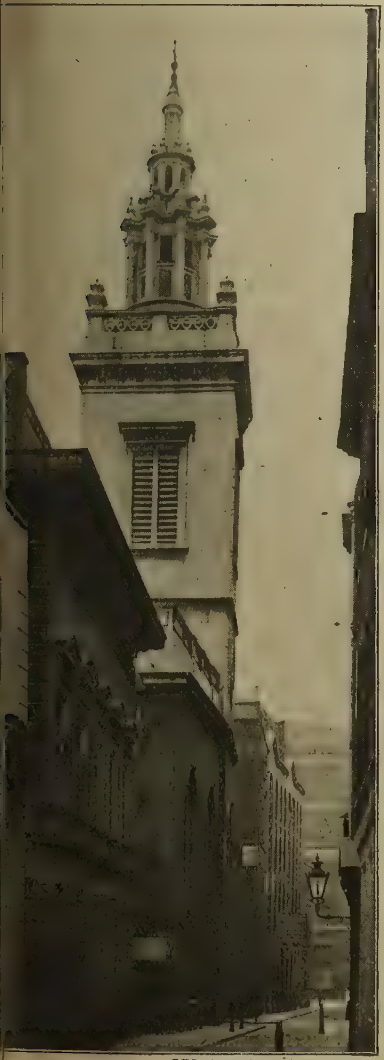
E LONDON CHURCHES 'F WREN AND LATER .RCHITECTS OF THE ENAISSANCE.

No. XVII.—St. James, Garlickhythe.

E church of St. James, Garlickhythe,
Garlick-hill, between its upper termina-
by Mansion House Station and Upper
ies-street. Garlick-hill owed its name,
ding to Stow, to the fact that garlick
sold on the banks of the river near the
h.

former church, which contained monu-
s to Lady Stanley, whose husband had a
ion on Paul's-hill Wharf, and to her son,
ied in the Great Fire, and the present church
built by Wren, its foundation-stone being
n 1676 and its final completion taking
in 1683. The church has narrow aisles
ated from the nave by Corinthian columns,
ntablature of which is returned towards
uter walls in the centre, thus indicating
iform outline. The ceiling of the nave is
, the window-heads breaking into the
of the cove with plaster groins as in
allows, Lombard-street, and other churches
period. The church is well lighted by
ws in each side, but the decorative scheme
leasing and the woodwork commonplace.
xterior treatment is vigorous if a little
, the tower being flanked on either side
rved and pedimented wings. The design
steeple is composed of three square stages,
wer marked by two columns at each
set diagonally, and the middle by curved
s carrying up the line of the angular
tions below, while the topmost stage is
with canted angles and urns standing above the trusses under. The balustrade of the tower is formed of the curved and pierced stonework often employed by Wren in his freer designs. Above the entrance is a fine clock surmounted by the figure of St. James.





[Photo: Geo. Trotman.

Wren's Churches: St. Michael's, Paternoster Royal.

The only monument of interest in the church is that to Seagrave Chamberlain, dated 1675, on the north wall.

With the parish is united that of St. Michael, Queenhithe, which stood on the north side of Upper Thames-street, and was demolished in 1876, which we illustrated in our issue of February 11. Trinity the Less was one of the churches destroyed in the Fire and not rebuilt, its parish being united with St. Michael, Queenhithe. Its name is preserved in Great and Little Trinity-lanes. The advowson of the church of St. James, Garlickhythe, has been, since the reign of Mary, in the hands of the Bishop of London.

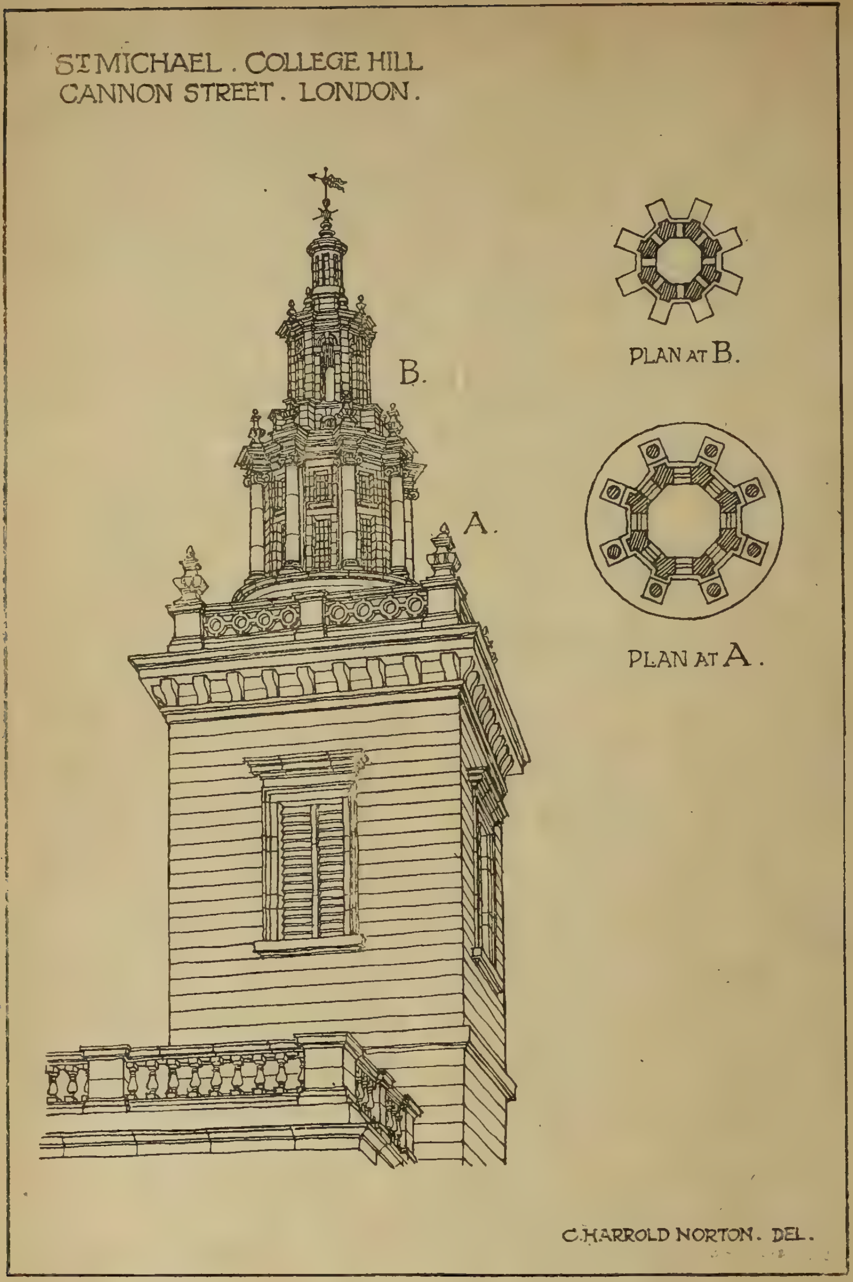
No. XVIII.—St. Michael, Paternoster Royal.

The church of St. Michael, Paternoster Royal, derives its title from the ancient names of adjoining lanes, Paternoster-lane and La Riole, probably so called because it was inhabited by wine merchants trading with La Riole, near Bordeaux, the name being subsequently corrupted to "Royal."

St. Michael now serves as the parish church for four benefices, viz., St. Michael, Paternoster Royal; St. Martin, Vintry; All Hallows-the-Great and All Hallows-the-Less. St. Martin Vintry, and All Hallows-the-Less were not rebuilt after the Fire. All Hallows-the-Great was demolished in 1895. The advowson of St. Michael, Paternoster, is in the gift of the See of Canterbury.

Three churches have probably been erected on the site. The first was demolished about 1400 to make room for a larger church, erected at the expense of Sir Richard Whittington, who, born in 1350, was four times Lord Mayor of London in 1396, 1397, 1406, and 1419. Besides rebuilding St. Michael's, he founded a college for priests dedicated to the Holy Spirit and St. Mary. The college was swept away in Henry VIII.'s reign, its library appropriated by the Duke of Somerset, and its site acquired by the Skinners' Company. The almshouses were preserved, and the foundation is now administered by the Mercers' Company.

The present church was completed in 1694 by Edward Stone, master mason, to Wren, working under his direction. The steeple was not added until 1713. The interior is a simple parallelogram in form with a coved ceiling. The church contains a good pulpit and other woodwork, but nothing of exceptional interest. Some of the woodwork of All Hallows-the-Great is reused in the chancel. Externally the most interesting feature is the steeple, formed of three circular stages, the lower a ring of eight columns, with the entablature broken



round each, and the spaces between filled with two tiers of windows, the middle a circular drum with arched openings and the upper tier a smaller circular feature surmounted by a vane. As at St. James, Garlickhythe, the balustrade round the tower is filled in with pierced stonework. The steeple, though undeniably graceful, is a little wanting in emphasis and character when compared with Wren's more masculine compositions.

◆

BUILDING CONTRACTS.

The annual meeting of the Glasgow and West of Scotland Master Plumbers' Association was held on the 24th ult. in the Christian Institute, Bothwell-street, Glasgow. The report by the directors was submitted, and stated that meetings had taken place during the year with other building trades in Scotland and with architects and surveyors, under the chairmanship of Sir George Askwith, Chief Industrial Commissioner for Labour, with the view of adjusting model conditions of contract for building in Scotland. These had been framed, and were now in operation, and the feeling was expressed that various matters relating to building contracts would, by the conditions of contract, be put on a more equitable and satisfactory basis for all concerned. A mode of measurement for plumber work to be operative throughout Scotland was in course of preparation.

THE CARPENTERS' HALL LECTURES:

THE ENGLISH ROOF.

The fourth spring art lecture arranged by the Carpenters' Company was given in the Hall of the Company on the 23rd ult. by Mr. Arthur Keen, F.R.I.B.A., whose subject was "The English Roof." In the course of his remarks the lecturer said:—

"English people are nothing if not modest and unassuming, but we probably do ourselves an injustice when we admit, as we are prone to do, that we are not an artistic people. As a matter of fact we have produced some of the finest painters that the world has known; we have an especially English art, and a very beautiful one, in water-colour painting. Architecture has flourished here exceedingly. Our great Gothic churches have a beauty that the Continental ones cannot rival; our great Renaissance buildings, such as St. Paul's and Greenwich Hospital, hold their own against all competitors, and in the craft that the Carpenters' Company had under its rule for so many generations we have an art that is in a very particular way an English one, and one in which the English skill has found few worthy competitors. We think of our ships as having ever been mighty in battle, and they have also been marvels of constructive skill and intrinsic beauty; our timber buildings, sturdy and strong after centuries of wear and weather, are intens beautiful. Where on the Continent of Euro can such things as the Guildhall at Lavenha Ford's Hospital at Coventry, or Great Tangl Manor in Surrey be found? Our joinery wo in the great country houses, in the halls of Trade Guilds, in the organ-cases and fitti of the old churches is quite wonderful a intensely national in character; and the tim roofs of our mediæval churches, of the Halls Westminster and Hampton Court, Eltha Exeter, York, and many another place unique, so national, and withal so full power and beauty, possess such a claim on notice that no apology is due to you expatiating on them even in this hall, wh they have often been dealt with before.

The roof has been the governing factor the arrangement and contrivance of our bui ings, and just as in the East the buildings contrived to support and buttress the do and its surrounding vaults, so in the No it is the roof that limits our architecture a disposes our churches in long narrow na and aisles and transepts that can be cove by a construction formed of timber, which only found in limited lengths. In fact, it the most important consideration in a pl and I suggest to people who like maki sketch plans for the guidance of their arc tects that they will never make a plan th is of any service until they have master some of the facts about roofing. The farms and cottages, the great manor hou that are among the most precious possessi of this land owe half their beauty to th simple straightforward roofing. The long m lines and dignified gables and the great chi neys upstanding at regular intervals gro themselves into beautiful arrangements, a offer a sky-line that is unrivalled in any ot kind of buildings.

The simplest possible form of roof is mere lean-to, just a sloping beam laid fr a high wall to a low one, and it might almost dismissed from consideration, only it is roof that is universally used, and often recei very skilful design and workmanship.

Used in churches it enables the interior be really well lighted by means of clerest windows. What is done in most churches secure good light is to raise walls on the arch between the nave and aisles, with windo in them, and to roof the aisles with lean roofs at a lower level. These lean-to roofs generally very flat, so that the wall contain the windows may not be too high. A wall arches is not a very stable thing, and the lo it is the better for its strength and securi and, of course, the cheaper. At the same ti if the aisle roof is a flat one the side walls be of a good height, and thereby the dign of the church is much enhanced and the a windows made larger than they would be i low wall. Sometimes these roofs are of lean form, and sometimes they are flat roofs slop both ways. Both these forms occur Lavenham in Suffolk.

Most of the old roofs are of very mass construction; often there may be quite tw as much material in them as a scientific c penter might think necessary. So obviou is this the case that in most instances the carpenters laid their rafters flat instead on edge after the modern fashion. Th realised that in the course of the centu of a building's life all kinds of things m happen. Alterations may have to be ma water may get in and rot off half the substa of a beam, a fire may occur, thatch may replaced by tiles or lead. If there is plenty material, the decayed wood can be cut c and a perfectly sound repair can easily made, and in any case a building with a la reserve of strength will suffer neglect for long period without collapsing. In old w it is with the roofs as it is with the wa which are so thick that they will remain sta ing long after reaching the point at which thin modern wall built of better mate would fall. And what value there is in am material from the point of view of appearan No amount of subtle and laborious de will compensate for the want of obvious solid and good quality in a building. It is alm the only thing that will satisfy us by its One of the best-looking roofs I ever saw orth Walsham in Norfolk, and there was moulding on it anywhere, but the timbers were enormous. It is a very interesting ple, because it is so contrived that arcades ı run from end to end of the church ut any cross walls are buttressed, and d securely by the nave and aisle roofs being cted. The tie beams run right through t mework of the arcading, and are framed right wall-posts on both sides, so that the are held as in a vice, and they as a matter ct remained quite upright for nearly 600 . It is when we have satisfied every rement of structural completeness that work may be made ornamental with ng, moulding, and colour; and it is then we see how finely these big timbers will themselves to decoration. They will such rich, full mouldings, such broad e of carving, and the colour decoration was often lavished on them is worthy of ure all to itself.

·identally, I may point out that the led work of the old roofs is always ght out of the solid wood. Carved and d crestings are cut in separate pieces ixed on, always in an honest and obvious but the mouldings are worked on the solid. are ornamented construction, not conted ornament.

e old carpenters loved the sweet simplicity ff cross beams of enormous size upholding oof and preventing any outward pressure. being a favourite covering material, lows that many roofs are practically flat ramed like a timber floor, with big cross s, smaller longitudinal ones called purlins, still smaller filling timbers called rafters. have, of course, a slight slope to the two they are richly moulded, panelled, ribbed, arved, and often have elaborately-carved ets to support the main beams.

e constructional problems connected with are mainly two in number—to prevent ırd thrust, and to prevent the rafters bending; and it is in dealing with these roblems that most of the scope for decorareatment is found.

ne of these nearly flat roofs have the beams cut out of bent trees, so as to the slope of the roof, but it is more usual t the beam deeper in the centre than at nds, as in an example at Astbury in ire.

re is no getting away from the fact that ost old roofs there was a good deal of ce placed on the resistance offered by hick heavy walls, but at the same time effort was made to reduce the outward ıre on them caused by the sloping roof rs. If you make a small wooden model, enting two rafters leaning against each you find that a slight pressure on the top s the supports at the bottom outwards. f you form a small triangle at the base of after by putting down a short horizontal and a short upright one, both of them d to the rafter, this movement is materially ed. This is what the old builders did. put a short timber across the wall, which ft. or more thick, framed the foot of the to the outer end of it, and then from the end of it they put a short upright piece ramed to the rafter. At the same time put cross-pieces higher up from rafter to . and other pieces across the angles, all d together, and this gave them what we trussed rafter roof—that is to say, a roof ich each pair of rafters is trussed or framed ıer so as to be self-supporting. A roof his is broad and satisfying in effect, and y reason of the constant repetition of its parts. It is a type of roof that was continually in the mid-Gothic period— e fourteenth century and onward—and endless variation in the arrangement roportions of its parts. Generally the of the roof is a steep one, so as to reduce ıch as possible the thrust on the walls. West Country the inner struts and crosswere often curved and much continuous, to give the roof the appearance of a vault. ny cases, and again especially in the West, nderside of these roofs, whether arched gular, was boarded to form a ceiling d into panels by moulded ribs with carved at the corners.

What we may call an open timber ceiling in a mediæval building, and an example that is interesting to Londoners, is that at Crosby Hall, pulled down in 1908 and re-erected at Chelsea. There were great crossed scissor beams to tie in the roof, and this ceiling was a practically independent construction below them. One imagines the ornamental pendants as being the lower ends of constructional posts, which is not the case, and in this respect we can only feel that the general design is unsatisfactory, although the work is so rich and beautiful. Sir John Crosby built this Hall, and as he acquired the property in Bishopsgate in 1466, and died in 1475, the date of the ceiling is fixed within a year or two.

Our English carpenter was a man of remarkable initiative, and he was for ever experimenting with new forms and methods. He realised early that the form of the stone arch might be adopted in woodwork, and he did adopt it freely and fearlessly, taking care to throw the ultimate thrust as low down as possible, because the walls that carried his work were high and were not strengthened much by buttresses. The arched form is not merely very pleasing in itself, but the ribs of timber that form the arch tie and bind into one solid construction the principal rafter, the wall pieces, and the collar beam, if there is one, near the apex of the roof, so that they are as if cut out of one piece of wood unbending and without thrust; but, of course, as I have pointed out before, in actual practice there is inevitably some movement due to shrinkage and twisting of the timber and so forth. Still, so sound and practical are they that they seem actually to hold and steady the high clerestory walls, full of large windows, and balanced on high arcades, so that they stand safe and well after five centuries of wear and strain.

A modern timber roof truss depends entirely on two great factors: one, that timber cannot stretch, and the other that used in short lengths it cannot bend, and it is about as perfect as anything in this imperfect world can be. The modern method was not used, as far as I know, in mediæval England, although in France it was adopted freely in forming the roofs of the cathedrals, and the wonderful timber flèches that adorn the crossing of some of the French cathedrals and tower up 120 ft. or more clear above the roof were carried by timber trusses formed on the principle that we now employ. The flèche at Amiens, covered with lead and weighing an enormous amount, is fully 150 ft. high, and stands above a roof that is 160 ft. high off the floor, and there it has stood for four centuries. But the English carpenters seem to have disliked the appearance of tie beams under high roofs, and to have striven always for the appearance of height and dignity that their arched constructions secured.

One of the greatest inventions of the mediæval carpenter—one of his most skilful contrivances —was the hammer-beam roof. In the early trussed rafter roofs there was, as I have pointed out, a triangle at the foot of the rafter which resisted outward pressure or spreading of the roof. In a hammer-beam roof this triangle becomes much larger—it projects boldly out from the wall, and is upheld by a slanting prop or brace jutting out from a wall-post below. The triangle thus supported becomes immovable, and the roof therefore cannot push the walls outwards. This method, once established, was recognised as a triumphant success, and it was used in the most fearless manner with all kinds of developments and modifications. The splendid possibilities of decorative treatment that it offered were seen at once and full advantage was taken of them, while the possibilities of interchange and variety among the many parts that composed the truss gave the opportunity for ever fresh treatment. If you go through the Norfolk churches you realise that the same carpenter must have worked in many of them and yet the roofs are never alike.

The finest construction of this class that we have, and altogether the most wonderful timber roof ever made, is the one at Westminster Hall, and a strange thing about it is that it was the first roof of its sort to be made—not merely the first with the great arched rib running up through the whole construction, but the first hammer-beam roof. The work of re-roofing Westminster Hall was begun in 1395, the materials having been got together during two years previously. John Godmeston, clerk, was put in charge of it, and Hugh Herland, carpenter, was appointed controller of the work. An interesting commentary on the social conditions of the time is to be noted in the fact that Godmeston was authorised to take the necessary workmen that he required—masons, carpenters, and labourers—wherever found, and to arrest and imprison those who resisted. The mason was also to "arrest" carmen, horses and carts, and ships and mariners for conveying the stone. The same system is shown by the fabric rolls to have been in operation in the building of Westminster Abbey in Henry III.'s reign, and it hardly bears out the theory of enthusiastic Churchmen who believe that the great works of mediæval times were built by the monks themselves out of sheer devotion and love, and without remuneration, although they have never told us how the monks learned their craft. Westminster Hall was built in the reign of William Rufus in 1097, and the original roof was in two or more spans, probably three. The walls were raised 2 ft. in Richard II.'s reign in preparation for the present roof. There are contemporary documents that give particulars of the purchase and carriage of materials, and all the arrangements for executing the work. The span between the walls is 69 ft., and the principals are 20 ft. from centre to centre. The complexity of the construction, combined with the huge size of the oak timbers used in it, makes the roof an amazing production. For instance, the great collar beam of each truss is a huge log of oak 38 ft. long and more than 2 ft. deep, and it had to be got into position 66 ft. above the floor. Everything else is on a similarly huge scale, and one stands astonished at the courage and resource shown by these old carpenters who could not only conceive such a thing, but who carried it out with such accuracy and precision of workmanship that they might almost have been handling the stuff on a bench in a workshop. The mere constructive and executive problem was stupendous, but these men looked far beyond this side of their task; they were artists, and they made their work so beautiful that one does not know which to admire more, its constructional sufficiency or the beauty of its appearance."

BOOKS.

Lesnes Abbey. By ALFRED W. CLAPHAM, F.S.A. (London: Cassio Press. 10s. 6d. net.)

THIS book consists of a carefully-compiled history, ecclesiastical and architectural, of the comparatively little known Abbey of Lesnes, and is illustrated by an excellent collection of photographs and a general plan. As a work of purely architectural interest it cannot be said to have a very strong claim, but from the antiquarian standpoint, and as a record of the results of the excavations and historical investigations, the book is a notable contribution to the literature. The plan is especially interesting and valuable, as an example of the conventual establishments of the Augustinian Order in this country. Apparently Reformation zeal has left but little beyond the foundations, although, as the illustrations show, the excavations have revealed some interesting fragments of ornament and design, one of the most important being a fine fourteenth-century effigy, which is now to be seen in the Victoria and Albert Museum.

From its foundation by Richard de Lucy in 1178, through the centuries to the Dissolution, the Abbey's history has been traced with every care, but there is no attempt at a description or account of the actual work of discovery. Possibly the author considered that such details hardly came within the scope of a book of this kind, but many will regret that a history of the undertaking has not been added, both as affording useful information on the conduct of archæological exploration and as adding a touch of the romance of discovery The volume will undoubtedly be appreciated by the antiquarian student, and is valuable for reference.

Lockwood's Builders', Contractors', and Engineers' Price-Book for 1916. Edited by R. STEPHEN AYLING, F.R.I.B.A., Member R.San.Inst. (London: Crosby Lockwood & Son, 7, Stationers' Hall-court, Ludgate-hill. 1916.)

THIS work, which obtained an important position in the world of price-books under the late Mr. Francis T. W. Miller, whose genial presence will be missed by all those who came into contact with him, appears for the first time under the editorship of Mr. R. Stephen Ayling, and we are pleased to observe that he is apparently determined that the work shall not stand still while under his control. The production of such a work—even if it is only a question of revision—is not a question of days or even weeks, but must obviously run into months, therefore the prices given are those which obtained generally in October last, and as such there is little cause for complaint, although at the present time we are afraid that many would be found inadequate. A careful examination of the prices shows that a most conscientious attempt has been made to revise them as far as possible, and to keep up the high reputation which this book has obtained. A very interesting table showing a comparison of prices of building materials from 1911 onwards is given, and another valuable addition is a series of diagrams illustrating the requirements of the London Building Act. Altogether the new editor is to be congratulated upon his work, and his first appearance augurs well for the future.

The Civil Engineers' Cost Book. By Lieut.-Colonel T. E. COLEMAN (Staff for Royal Engineer Services). Second edition. Revised and enlarged. (London: E. & F. N. Spon, Ltd., 57, Haymarket. 1916.)

THIS work is on the same lines as the author's work on "Approximate Estimates for Building Works," and is full of the most useful information. It will be found of great service in preparing approximate estimates for engineering works, for the prices, although "lumped" and some latitude in the figures given, there being sometimes a difference of 50 per cent. or more between the minimum and maximum, which, however, is inevitable in a work of this kind. Many of the prices are based upon the actual cost of works, of which the author has managed to get together a marvellous collection. To our mind this collection would have been infinitely more useful if the dates had been given when the various works were executed, and some we must confess can be of little practical value—*e.g.*, the prices per square of the roofs to Cannon-street S.E.R. Station and the St. Pancras (Midland) Station are interesting as records, but can hardly be applicable at the present time. The author, by the way, does not make it clear whether the "square" refers to the floor area covered or the area of the covering. In the case of the St. Pancras roof there are two or three dimensions to which the measurement might apply. There is a fairly complete collection of prices of reinforced concrete work with numerous examples of executed works, but we would point out two obvious errors on page 225, where the cost of the Calcutta tank is given at 1¼d. per gallon capacity. This should, we think, be 2¼d., and in the case of the Ugborough tank, which should be £12 10s. per 1,000 gallons instead of £17 18s. We are not very clear as to the items of hopper bins on page 218, where prices are given as "5½d. to 7d. per foot cube," and then immediately following "8d. to 1s. per foot cube of storage capacity." There is a somewhat similar item on the following page. If the 8d. to 1s. is for "storage capacity," to what does the 5½d. to 7d. refer?

We have dealt with this work at some length because, despite our criticism, as a whole it is a most creditable production, but it could be made much more useful, in our opinion, if the dates of the examples were given.

CORRESPONDENCE.

Wren's Churches.

SIR,—I am heartily in accord with Mr. Lindley Latham's excellent suggestion with regard to the inauguration of a permanent exhibition of Wren's model of his first design for St. Paul's Cathedral, accompanied by a collection of well-prepared models of the destroyed City churches.

Although, as Mr. Latham points out, it may not be found possible in these troublous times to give immediate effect to the proposal, yet, as the collection of models could scarcely fail to strengthen the slowly-growing interest of the general public in the architectural history of London, the idea appears to me to be one of a nature that ought not to be allowed to fall into oblivion. A. W. S. CROSS.

Contracts.

SIR,—One hears a good deal of the difficulties of contractors in carrying out contracts entered into previous to the war, and one is struck by the unreasonableness of many private individuals and also public institutions in recognising these difficulties, and their refusal to enter into any negotiation with the contractor, who finds himself involved very often in serious losses owing to circumstances brought about by the war.

But what strikes one as similarly unreasonable, and really unnecessary in these difficult times when supplies and prices fluctuate almost daily, is to see the usual forms of tender still being advertised by many councils and corporations for supplies to cover for no less than twelve months' requirements.

This is the usual period with these contracts in ordinary times, and, although it must be apparent that in making period contracts at the present time a good deal must be left to pure chance, there does not seem to be any general inclination to make things easier by reducing the periods to say three months or even six.

This apparent indifference to existing conditions is very prevalent, and difficulties which could be obviated are still allowed to exist. G. C. BOWERS.

Should Art Be Artless?

SIR,—Mr. J. Alex. Pirie remarks on Mr. Bond's quotation in the R.I.B.A. *Journal* about the men of the Middle Ages performing their work beautifully, that "each architect knew nothing and cared for nothing but the work of his own day, and this narrow-mindedness was his artistic salvation. We moderns know too much."

I quite agree with Mr. Pirie so far, and think this is a matter that requires the most careful investigation with fair and reasonable broad-mindedness, yet there seems some truth in Mr. Bond's remarks, for at page 136 of the last issue of this valuable paper we read, "Those who are employed in any capacity in connection with the decorative scheme of Westminster Cathedral have much to contend with because, in the nature of things, their task is a most difficult one in the present age. The number of architects who can design a building of outstanding architectural merit are few."

Knowledge is good, and we cannot get too much, but the fruit it bears is always open to criticism.

JOHN W. GRANT, A.M.C.Inst.(Lond.).
Greenock.

Westminster Cathedral.

SIR,—Referring to the "Note" in your issue of the 18th ult., headed "Criticism or Abuse?" it seems to have escaped notice that the initials attached to the *Observer* letter defending its criticism of St. Andrew's Chapel are identical with those of Mr. Konody, the critic himself. The inference seems fairly obvious, and, whatever objection may be raised to this gentleman's views in a given case, one can scarcely deny his competence as an art critic or his knowledge of colour merits. If, as you point out, the architects capable of directing the design and execution of a colour scheme are very few, is not that a reason the more for allowing weight to the views of the competent outsider? not, where is the voice that can claim hearing?

There is this much at least, it seems to me, to said in regard to this discussion, that the att has been much more definite than the defen which has consisted very much in object to objection. As to the particular le mentioned, the bathroom simile, if bo strikes one nevertheless as apt, for really entering St. Andrew's Chapel one has a sen tion akin to that of being up to the neck cold water. Is there, I would ask, any congru between these chilly marbles and the glow gold and colour above them? Is it right arrange the weight at the top and the lig ness below? Is it according to precedent the style? Are the marbles harmoniou matched among themselves? Again, to t the chapel in relation to its surroundin Does it accord with the treatment of the nei bouring chapel and its pendant (the m likely from their date to embody Mr. Bentle own ideas), where in both cases the mar dados are deep in tone and weighty in eff and the entire colour scheme is harmoniou rich, mellow, and solemn? And, if not, it be claimed that Mr. Bentley's guidanc being followed in any true sense by successors?

These are plain questions, and I add them, as suggested, to the *Builder* rather t to the *Observer*, though I cannot see how a one is to blame for writing to the organ wh initiated the discussion, and whose colu are equally open to friend and foe, exp and amateur. It would be easy to enla one's inquiries so as to include the m figure in relief on the flat inlay of marble, that would be exceeding the scope of original criticism. RHO

ie business of Sir Arthur Blomfield & Sons, erto carried on by Capt. Charles J. nfield and Mr. Arthur C. Blomfield at Iontagu-place, Baker-street, W., has been sferred to the Eyre Estate Office, 125, :-road, N.W. Capt. Blomfield can also ommunicated with at the headquarters of Artists' Rifles, Duke's-road, Euston-road, . (telephone, Central 10814); and Mr. ur Blomfield, as before, at the Architect's e, Bank of England, E.C.

The Architectural Association.

ie address of the Architectural Associa- is now No. 37, Great Smith-street, tminster, S.W.

The Late Mr. H. L. Florence.

ie Architectural Association was repre- d at the funeral of the late Mr. H. L. ence by Mr. H. Austen Hall (President) Mr. F. R. Yerbury (Secretary). The late Florence was President of the Architectural ciation during session 1878–1879.

The London Society.

ie fourth annual general meeting of this ety will be held in the Hall of the Royal ety of Arts, 18, John-street, Adelphi, ., on Thursday, March 9, at 5.30 p.m. At meeting the annual Report and balance t of the Society will be submitted. Lord nouth, the President, will take the chair, Sir Aston Webb and others will speak. ddition to the adoption of the Report and nce sheet, members will be asked to elect the ncil for the ensuing year.

The Institution of Civil Engineers.

the meeting of this Institution on Tuesday, ch 7. an address on "Industrial Develop- :" will be delivered by Mr. Harold Cox. nviting Mr. Cox to address the Institution his subject, the Council have considered the present time calls for some earnest ation on the part of engineers to the economic s which, after the war, must influence oundly the future of engineering, as well he industrial and commercial enterprises h are vital to its progress both in this try and abroad. The meeting will be at p.m.

The Drainage of Cairo.

. Charles Carkeet James, M.Inst.C.E., ie last meeting of the Institution of Civil neers, read a paper on "The Main Drainage 'airo." The paper commenced with the ry of the steps taken by the Egyptian rnment for the drainage of Cairo from to 1906, and then described the scheme ubsequently designed and carried out by author, and officially inaugurated by the Minister of Public Works on March 22 year. The purification works at Gebel-el- r are designed to treat 11 million gallons day through six hydrolytic tanks and eight inuous filter-beds with storage-tanks for ng up the night-flow.

Egyptian Monumental Art.

ofessor G. Baldwin Brown recently lectured The Monumental Art of Ancient Egypt" meeting of the Glasgow Branch of the ptian Research Students' Association at gow University. He said that the struc- of the old Empire were in the best sense imental through their severity of treatment uch as by their actual prodigious size. On other hand, the temples of the new Empire huge in bulk, but failed to produce the æsthetic impression. Nature had lent ie incomparable works of the old Empire wn majesty, while on the other side human n had permeated them in every part and s complete mastery of them had stamped with the impress of style.

Belgium After the War.

It is stated by the Central News correspondent at St. Paul, Minn., that Mr. J. J. Hill has been invited to take the direction of the work of reconstructing the Belgian railways and buildings after the cessation of hostilities. Mr. Hill has informed King Albert that he is willing to accept the task.

"The Year's Art."

The "Year's Art" for 1916, compiled by Mr. A. C. R. Carter, has just been issued. As an epitome of matters relating to the arts of painting, sculpture, engraving, and architecture and to schools of design which have occurred during the past year, together with information respecting the events of the year 1916, it is of considerable interest and value, and leaves little or nothing to be desired. The editor records the chief events of the year. The work, the thirty-seventh annual issue, includes several full-page illustrations, and is published by Messrs. Hutchinson & Co.

Society of Antiquaries.

A meeting of the Society of Antiquaries was held at Burlington House recently, Sir Hercules Read presiding. A gilded bronze boss of Irish work, *circa* 750, which was found at Steeple Bumpstead, Essex, was exhibited by permission of the vicar, the Rev. W. F. D. de Langdale. Mr. Reginald Smith, in a series of notes illustrated by lantern slides, said that the boss, while not a masterpiece, belonged to that period of Irish art, the eighth century, when masterpieces were common. Sir W. St. John Hope then described the seals of the Abbey of Waltham Holy Cross; and a number of panels made up of broken pieces of mediæval stained glass were exhibited. Mr. Eden said that the fragments ranged from the thirteenth to the nineteenth centuries, and among the most complete pieces were to be seen the arms of Bishop Grandison, of Exeter, and of the de Lacy family.

Cost of Road Improvements.

The Road Board have, under date of February 25, issued the following circular to county authorities:—"I am directed by the Road Board to inform you that they have been in communication with the Treasury as to the policy to be observed by the Road Board in regard to applications for advances towards the cost of road crust improvements to be carried out during the financial year 1916–17, and it has been agreed that new grants or loans, to an aggregate sum not exceeding £200,000, may be made out of the surplus at the credit of the Road Improvement Fund. The grants and loans will be confined mainly to expenditure on tar treatment of important roads, either in the shape of surface dressing or pitch grouting or tar macadam. It has been brought to the notice of the Board by the Ministry of Munitions that certain products obtained from the distillation of crude tar are of great importance in connection with the supply of high explosives, and on that account it is desirable to encourage the use of refined tar by highway authorities. Apart from this, however, the Board consider that at the present time, when it is desirable to economise expenditure as much as possible consistently with adequate maintenance, a surface dressing of tar is generally the most effective and cheapest method of preventing disintegration and thereby prolonging the effective life of a road crust, provided that the surface is in sufficiently good condition to justify the application of the tar dressing. The Board will require to be satisfied on the last-mentioned point in the case of each application for a grant. No grants will be made for the use of crude tar. Applications for grants or loans should be sent forward at an early date, and should be accompanied by—(1) Particulars relating to the proposed improvement; (2) a summary of the highway estimates of the Council for 1916–17; and (3) a statement showing the total expenditure on roads and bridges in 1914–15 and 1916–17 (estimated) in continuation of the information supplied to the Board on yellow form 42, 'Information relating to the expenditure by county councils on roads and bridges.'"

Collapse of Sidestrand Tower.

The old church tower, on the Sidestrand cliffs, Norfolk, collapsed on Saturday last in consequence of the recent severe weather. It had been on the edge of the cliff for years. For the most part the masonry is dashed to pieces on the shelving cliff below, but here and there blocks are to be seen.

The Royal Institute of British Architects.

At Monday's meeting of the R.I.B.A., Mr. Ernest Newton, A.R.A., the President, being in the chair, the nomination of Sir R. Rowand Anderson, LL.D., as the Royal Gold Medallist for the year, was proposed and carried by acclamation. There was no other business except the usual formal announcements, and the meeting terminated in less than ten minutes.

Wood and Stone Imports.

The President of the Board of Trade has appointed the following Committee to grant licences in special circumstances for the importation of furniture woods, hard woods, and veneers, and of stones and slates, the importation of which, except by licence, was recently prohibited by Proclamation:—Mr. J. H. Bovill (Chairman), Mr. George Burt, J.P., and Colonel G. T. V. Cobbett. Mr. H. J. Phillips, of the Board of Trade, will be Secretary to the Committee, and all communications relating to the importation of the goods mentioned should be addressed to him at Gwydyr House, Whitehall, London, S.W.

Charing Cross Bridge.

The Bill of the South-Eastern and London, Chatham, and Dover Railway Companies for power to strengthen Charing Cross Bridge has been passed by the examiners of the House of Lords for Second Reading and Committee stages. The Bill will be opposed in Committee by the London County Council, the Port of London Authority, the Gas Light and Coke Company, and the lightermen and barge owners of the Port of London. The engineer's estimate of the cost of the work is as follows:—Strengthening of bridge, £150,000; contingencies—10 per cent.—£15,000; easements, £2,000; a total of £167,000.

The R.I.B.A. Annual Elections.

The R.I.B.A. *Journal* which appears on March 4 will contain the following announcement:—"A special general meeting will be held on Monday, March 13, 1916, at 4.30 p.m., to consider a proposal which will be submitted by the Council in order to avoid holding an election for the Council and Standing Committees in 1916 during the absence of several hundreds of members serving with the Forces. The following resolution will be moved on behalf of the Council:—'That in accordance with the provisions of Clause 33 of the Charter application be made to the Privy Council to sanction the suspension of the by-laws governing the annual election of the Council, the Standing Committees, and the Hon. Auditors, so that the Council, the Standing Committees, and the Hon. Auditors elected in June, 1915, shall remain in office until June 30, 1917.'"

The East End Dwellings Company.

In the Report and accounts of the East End Dwellings Company, Ltd., for the year 1915 it is stated that, exclusive of the old property in Victoria Park-square, the rents attributable to 1915 were £40,182 13s. 7d., as compared with £39,820 15s. for 1914, and the lettings have again been very satisfactory. Including £1,078 13s. 1d. brought forward from 1914, the profit and loss account shows a credit balance of £15,731 18s. 10d. Out of this sum £4,000 has been carried to reserve, which now amounts to £76,000, and interim dividends for the first half of 1915, at the rate of [illegible] per cent. per annum (less tax) on the Preference shares, and 5 per cent. per annum, free of income-tax, on the Ordinary shares, have been paid. The directors now recommend a similar distribution for the half-year ending December 31, 1915. After providing for these dividends, and also for directors' and auditor's fees, a balance of £1,023 19s. 4d. will remain to be carried forward.

New Throne, Bristol Cathedral.

THE new bishop's throne, which we illustrate, has been recently completed. It is of English oak throughout, and stands against the pier between the second and third bays of the choir immediately eastward of the stalls on the south side. In front of the throne is a seat for the chaplain. In the spandrels of the panels below the bishop's bookboard are the date and initials of the bishop. Over the bishop's seat is an inscription, "Sedes Episcopatus Bristolliensis"; above in the centre panel are the arms of the see surmounted by a mitre. Shields have been introduced in the tracery of the ends of the bishop's seat, one charged with the arms of the see impaling those of the bishop, the other with the arms of the Province of Canterbury. The canopy, in the form of a "tester," is supported by six groups of pinnacles and buttresses, and is finished with an elaborate cornice and cresting. The detail throughout has been designed to harmonise with the ancient work in the choir stalls. It has been executed by Mr. W. H. Saunders, of Cirencester, from the designs of the architect, Mr. Roland Paul, F.S.A.

University of London, King's College for Women.

WE give some clever impressionistic sketches by Mr. Charles Holden. Messrs. Adams & Holden are the architects of the building, which we recently illustrated.

Wren's Churches.

WE give reproductions of two plates of St. Michael, College-hill, and St. James, Garlickhythe, from "The Churches of Sir Christopher Wren," by J. Clayton, published by Messrs. Longmans, Green, Brown, & Longmans, which we give by the courtesy of Messrs. Longmans, Green, & Co. Further notes on the two churches will be found on page 175, and we are giving the plan of St. James, Garlickhythe, in our next issue.

Altar and Reredos, Reading, U.S.A., and Salem Reformed Church, Allentown (Pa.), U.S.A.

THESE works have recently been carried out in America from the designs of Mr. John W. English.

Some Measured Drawings.

THESE drawings of rood screen, Hexham Abbey, the Abbot's door, St. Albans, and pulpit in St. Michael's Church, St. Albans, were measured and drawn by Mr. John W. English.

MEETINGS.

Monday, March 6.

Surveyors' Institution.—Mr. G. Turville Brown (Fellow) on "The Management of Estates in Mineral Districts and Mineral Valuations." 5 p.m.

University Extension Lecture (at the Victoria and Albert Museum).—Mr. Banister Fletcher on "Sir Christopher Wren and His City Churches." 4.30 p.m.

Tuesday, March 7.

Institution of Civil Engineers.—Mr. Harold Cox on "Industrial Development." 5.30 p.m.

Wednesday, March 8.

Northern Architectural Association.—Ordinary meeting. 4.30 p.m.

TES ON CURRENT CASES.

e Urban District Council *v.* Fidelity nd Deposit Company of Maryland : Contractor and Surety.

AKING into account the fact that in
many contracts for works of any
magnitude the employer protects him-
ainst default of the contractor in com-
the works or in not properly carrying
out by requiring the contractor to find
s to guarantee the employer against loss,
urprising how few cases come before the
in regard to such matters. In the case
above, however, which was recently tried
Mr. Justice Bailhache, and reported
16] 1 K. B. 25, some points of interest
nportance were the subject of litigation.
a contract entered into in 1912 the con-
r agreed with the Hoole Urban District
il to carry out certain sewerage works,
the terms of the contract the contractor
find good and substantial sureties for
e fulfilment by him of his contract. The
iants, the Fidelity and Deposit Company
ryland, gave to the plaintiffs a bond,
g even date with the contract, whereby
bound themselves in a sum of £500, the
ion of the bond being that the contractor
"well and truly perform, fulfil, and
ll and every the clauses, terms, conditions,
ipulations in the said recited contract."
id terms and stipulations did not include
xpress agreement by the contractor that
event of litigation arising between him
ne Council in connection with the per-
nce of the contract, and of his failing in
tigation and being ordered to pay the
he would pay them. The contractor
to carry out the work satisfactorily,
reason of his alleged neglect in the
of the sewer injury was done to certain
d water mains, and property belonging
d persons was damaged. He also failed
her to complete certain of the works
ted for. Disputes arose between the
tor and the District Council, and he
t an action against them, claiming that

s, but denied their liability for the

the plaintiffs it was argued that the
overed all the conditions for the due
nt by the contractor of his contract, and
e defendants would pay everything
ch the contractor would be liable as
ural consequences of his breach, which
nclude the liability to pay costs reason-
curred in enforcing a claim against
r damages, which liability may be
d to have been in the contemplation
rties at the time they made the contract
bable result of the breach.

The defendants, on the other hand, contended that the condition of the bond being that the contractor should fulfil his contract, they were liable under the bond to pay costs only if the non-payment of the costs by the contractor was a breach of his contract. The contract was silent on the subject of costs, and they said that there was no implied undertaking to pay any costs that might be ordered against the contractor in any litigation arising out of the contract. The costs which the contractor was liable to pay were payable not under any agreement but under the arbitrator's order, and for a breach of that order the defendants were not liable under their bond.

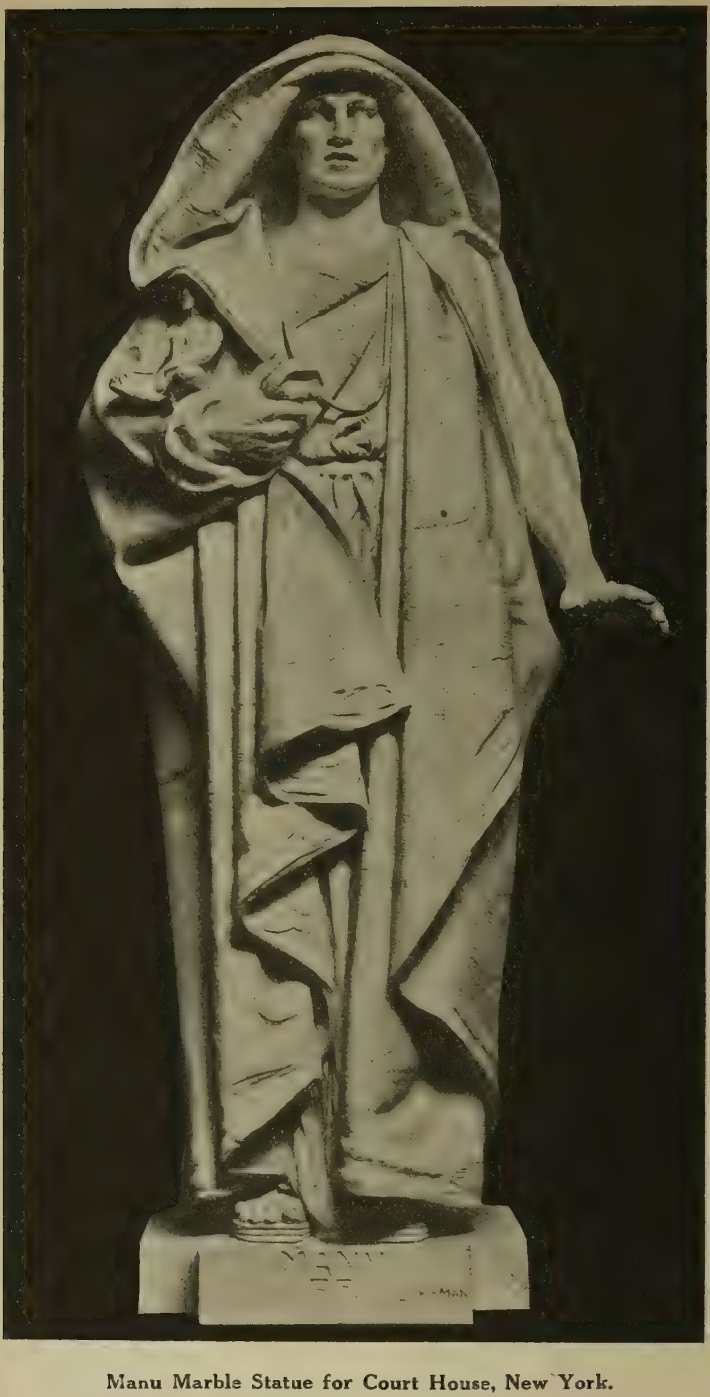
Mr. Justice Bailhache, in giving judgment for the defendants, said that the action arose upon a bond which was annexed to a contract for the execution of certain sewerage works in 1912. The bond was given by the defendants to the plaintiffs in the sum of £500, the condition of the bond being that the contractor should duly fulfil his contract with the plaintiffs, the contract being of even date with the bond. As the contract approached completion disputes arose, as not infrequently happens in such circumstances, between the contractor and the District Council as to whether the contract had been duly fulfilled or not. The contractor brought an action against the Council, in which he claimed a sum of £603. The Council admitted liability for £152 and disputed liability for the balance. They also counterclaimed against the contractor in respect of a certain liability to third parties, and in respect of damages for works uncompleted. Shortly after the commencement of the action it was apparent that it was a case which had better be dealt with by arbitration than by action, and by consent the whole matter was referred to an arbitrator. The result of the arbitration was that the contractor recovered no more of his claim than the £152 which the Council had admitted, and the Council recovered on their counterclaim £329, so that on the balance of those figures there was due from the contractor to the Council the sum of £177. The arbitrator also awarded to the Council their costs of the action and the arbitration, which costs were taxed at £398. That sum when added to £177 damages made a sum of £575, which exceeded the amount of the bond. The Council accordingly claimed that they were entitled to recover from the defendants the whole amount of the bond in respect of the damages and costs. The defendants admit their liability for the £177 damages, but deny their liability for the costs. The Council say that it is in the natural order of things that when a contract of this description comes to be finished there should be disputes between the contractor and the employer, and that upon such disputes arising it is a reasonable thing to submit them to arbitration, and they say that these costs were incurred as the result of a reasonable course of conduct which must have been in the contemplation of the parties when they made the contract, and they ask that those costs may be added to and form part of the damages which are due to the Council under the contract. He had no doubt that the course taken by the Council was a reasonable course, and he thought that if before any of the costs had been incurred they had given the defendant company notice of the nature of the disputes with the contractor and of the proposed arbitration, and the defendants after receipt of such notice had either expressly or impliedly by their conduct requested the Council to proceed with the arbitration, they might have rendered themselves liable for the costs; though that liability would not have been based on the conditions of the bond but would have been an independent cause of action arising out of the express or implied request. Here no such notice was given, and there was no express or implied request, and he had therefore to see whether the defendants were liable under the terms of the bond. Now the condition of the bond was that the contractor should perform, fulfil, and keep all the terms, conditions, and stipulations of the contract. The question, therefore, was whether the failure by the contractor to pay the costs was a breach of his contract. As a rule, he said, when costs are to be paid as the result of an action or of proceedings before an arbitrator they fall to be paid by reason of the judgment given in the action or of the arbitrator's award, and not by reason of a stipulation in the contract out of which the dispute arose which formed the subject-matter of the action or reference. He had looked carefully through the contract and had been unable to find any undertaking by the contractor to pay any costs which might be awarded against him, and under those circumstances he had come to the conclusion that he could not add the costs to the amount of the damages that were awarded, and so make the defendants pay the costs under the terms of their bond.

After this decision local authorities and employers generally will probably see that their guarantee bonds contain a provision for the payment of costs arising out of disputes as well as the actual damages sustained.

A guarantee of this nature, which is a promise to pay the debt of another, is within the Statute of Frauds, and must therefore be in writing, which must be signed by the person to be charged or by his duly authorised agent, and the document must set out in detail the nature of the transaction and the obligations arising out of it, otherwise the guarantee cannot be enforced in an action at law.

In the case of Mountstephen *v.* Lakeman (1874) 7 H. L. Cases 17, the defendant was the Chairman of the Board of Health at Brixham, and the plaintiff was a builder and contractor at Torquay. In the early part of 1866 the plaintiff had completed for the Board a main sewer for the town, and the Board had directed him to purchase pipes which would be required to be used in making the connecting drains between private houses and the main sewer. The Board had under the Public Health Act of 1848 given notice to the owners of certain houses near the main sewer to connect the drains of their houses with it, or in the event of default on the part of the owners the Board would make the connections at their expense. The notice was disregarded, and no subsequent resolution was passed by the Board authorising the connections to be made on their behalf. The Surveyor to the Board suggested to the defendant that he should make the connections, but the plaintiff declined to do so until he had the order of the Board. Before, however, the date on which the notice to the house owners expired, the plaintiff having finished the main sewer and being about to remove his carts and materials, Lakeman asked him what objection he had to making the connections, to which the plaintiff replied, "None, if you or the Board will order the work or become responsible for the payment"; on which the defendant said to the plaintiff, "Go on and do the work and I will see you paid." The plaintiff did the work, but the Board, alleging that no order had been given by them for the work, declined to pay for it, and Mountstephen brought an action against the defendant for the amount due for the work.

The case was tried at the Devon Summer Assizes in 1870, when the jury returned a verdict for the plaintiff for £287. Upon a motion to set aside the verdict in the Queen's Bench the court held that coupling the expressions used with the conduct and position of the parties the defendant's words did not amount to an engagement to be primarily liable for the work, but only to a promise that if the plaintiff would do the work on the credit of the Board the defendant would pay if the Board did not; and that this was a promise to be answerable for the debt of another within sect. 4 of the Statute of Frauds, though in fact the Board had never been indebted, and as this promise was not in writing it could not be enforced.



Manu Marble Statue for Court House, New York.

Mr. Augustus Lukeman, Sculptor (*See* "Some Modern Sculpture," *page* 183.)

On appeal to the Exchequer Chamber this decision was reversed, that court being of opinion that there was evidence to go to the jury on the question whether the defendant had not by his words made himself primarily liable.

On an appeal to the House of Lords by Lakeman, the Lord Chancellor (Lord Cairns) said the question for decision was whether there was or was not evidence of an original liability on the part of the defendant to pay the plaintiff for the work to be done, and that question fell to be determined really upon the consideration of the evidence of the plaintiff in the action. That evidence might have been accepted by the jurymen or it might have been rejected, but the question was whether or not the learned judge would have been right in directing a nonsuit on the ground that there was no substantial evidence to go to the jury. The plaintiff, in cross-examination, said that he knew nothing of the resolution of the Board that notices should be served on the owners of the houses requiring them to connect their houses with the main sewer, but that the Surveyor asked him if he would procure 1,300 ft. of pipes and if he would do the work. His reply to the Surveyor was that he would not do the work unless the Board would be responsible for the payment, as he would not take orders from the owners of the property. A resolution of the Board was produced which showed that notices were to be issued to the owners and occupiers of the property and that the plaintiff should procure 1,300 ft. of pipes. It was admitted that this resolution was communicated to the plaintiff, who said that, relying upon it, he procured the materials. The plaintiff might have been right or wrong in thinking that was a proper order, but he was satisfied with it. No order, however, was given for anything further to be done, and he refused to lay the pipes without an order from the Board. The plaintiff then met the defendant, who was the Chairman of the Board, who said to the plaintiff, "You go on and do the work, and I will see you paid." It appeared to his lordship that what happened was that the plaintiff after his conversation with the Surveyor stated to the defendant that the reason why he had refused to do the work was that he had got no order to do it, that he would do the work if he had a formal order from
the Board, or if he had a personal ord
the defendant himself, and that th
the defendant, who perhaps wished the
be immediately done, said, "You go on
the work; do not concern yourself u
subject of whether you have an order f
Board. I will be your paymaster; I
you paid." Now, if that was the mea
these words, he thought there was
and strong evidence to go to the jury t
go-by was entirely given to the ques
an order of the Board, and that the de
stepped in and undertook himself, as a
of primary liability, to pay for the wo
would be done. Against that primary
the defendant might afterwards, as Ch
of the Board, have sheltered himself by o
from the Board the consent to make a
order, and acting upon and paying und
formal order, but he did not do that;
what the contractor required—that is,
the contractor in the position of havi
and there an absolute contract made, a
only contract which then and there abs
could be made would be a personal and
contract by him to pay the contractor
work to be done.

Lord Selborne said that at first s
appeared as if the judges in the Court of
Bench thought that there might in th
have been a valid contract of suretys
a secondary liability upon the princip
guarantee for the debt of someone el
he was unable to follow that reasoning.
could be no suretyship unless there
principal debtor, nor can a man guarant
body else's debt unless there is a debt
guaranteed. The tendency, therefore,
view of this contract which would plac
the position of a guarantee for a future
to be undertaken by the Board wo
absolutely to defeat the whole purpose
conversations, which was to remove a d
then pressing upon the mind of the cont
as to whether or not he had sufficient au
from any one to go on with the work; a
answer was given in terms of the pres
the express purpose of inducing him to
at once.

The decision of the Court of Exc
Chamber was therefore upheld and the
dismissed.

It may be noted that if in this ca
defendant had told the contractor t
would see that he would be paid by the
the matter would have been on an e
different footing, and if the defendant h
that he would pay for the Board it woul
been a guarantee that would have
unenforceable unless reduced to writin
signed by the defendant.

THE LAW AS TO BUILD LET AS FLATS.

Although of late years the prac
letting out buildings in separate floors,
as residential flats or for business pu
has acquired great popularity, yet t
regulating the respective rights and
of landlords and tenants in such circum
remains in some uncertainty and is cu
obscure. In a recent article we refe
the case of Hart v. Rogers and some
decisions on this subject, but there are
two points connected with the decision
case which raise questions of such di
that we may revert to the subject.

In Hart *v.* Rogers (the *Times*, Decen
1915) the plaintiffs were suing for two qu
rent of a furnished flat and a sum fixed
lease to be paid at the end of the tena
respect of dilapidations. The defendant
that, owing to the defective condition
roof from neglect to repair, water had
his flat, rendering it unfit for habitatio
he counterclaimed amongst other thi
respect of the illness of his wife, wh
alleged was caused by the leakage.

As a breach of even an express coven
repair is no defence to an action fo
(Surplice *v.* Farnworth, 7 M. & G. 576),
a matter for cross action, or nowadays c
claim, the important findings in this case
upon the counterclaim.

The point as to the illness of the defe
wife can be disregarded, as that was h

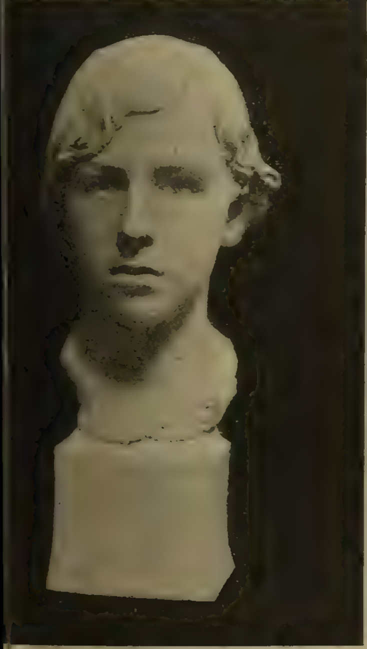
e been caused by the damp, the judge, er. found that the flat was rendered ntable for a time and allowed something counterclaim for discomfort and inter- with the tenancy, but—and this is the ant point in the case—he only did so on ting that there was an absolute duty on ndlord to keep the roof in repair, and, reviewed the authorities, he expressed doubt on the point as there was no e negligence proved in the case, and mated that if the true view of the law at in such circumstances the landlord nly take reasonable care to keep the order, then the plaintiff would be entitled gment both on the claim and on the rclaim, and the defendant's case would

difficulty lies in determining what is ty implied by the law where part of the es remain under the control of the d. In the case of unfurnished houses s no warranty implied that they shall for occupation, whilst in the case of ed houses there is an implied warranty ey shall be fit for human habitation at nmencement of the tenancy, in the case ldings let as flats where the landlord control of certain portions, however, the pears most uncertain.

ur former article we referred to some of ses on this question—Hargroves v. p ([1905] 1 K. B. 472), for instance; but se is distinguishable from that we are nsidering, because in that case there was g of negligence on the part of the land- hich amounted to an act of commission part leading to the damage. In the case v. Hancock ([1893] 2 K. B. 177), also d to in our former article, the plaintiff t a tenant, but a person visiting the on business; one of the steps in the se was in a defective state, and the ff fell and broke his leg. This was se upon which Mr. Justice Scrutton his judgment in Hart v. Rogers, but the for his hesitation is that that case has uestioned in subsequent decisions.

Hargroves v. Hartopp, the Lord Chief expressed some doubt whether an e covenant to repair could be implied, Huggett v. Miers ([1908] 2 K. B. 278), in which that principle was endeavoured shown to extend to the lighting of a n staircase, the Court of Appeal ed some doubt on the correctness of ision in Miller v. Hancock.

Hargroves v. Hartopp, the Lord Chief Justice expressed the opinion that the court in Miller v. Hancock intended to lay down the same principle as applying to the tenant as to a visitor, the plaintiff in that case, but here again a difficulty arises, as in a recent case, Lucy v. Bawden ([1914] 2 K. B. 318), where the wife of a tenant (who is in the position of a stranger to the contract of tenancy—see Cavalier v. Pope ([1916] A. C. 428)—had sustained injuries by falling over a low coping, Mr. Justice Atkin limited the decision in Miller v. Hancock to defects in the nature of a trap.



ila": Head of Young Girl (Plaster).

By Mr. W. Reid Dick.

oyal Academy, 1915.)

Thus, unless actual negligence can be proved on the part of the landlord as regards those portions of the premises which remain under his control, there is considerable doubt whether an absolute covenant can be implied on his part to keep those portions in repair, and a tenant of a flat who finds his portion of the premises rendered untenantable and who may, moreover, have sustained damage to his furniture, may find himself also confronted with litigation of an uncertain character if he attempts to seek any redress.

The layman may find these legal intricacies incomprehensible, and we fear he may find our explanation of the law confusing, but we have only referred to this question again that we may point out to him an easy means of securing himself. It is only the implications of the law that in these cases remain in uncertainty, but these implications only come into operation in the absence of express agreement; therefore there is no difficulty when taking a flat in so framing the agreement that the obligations of the landlord as regards those parts of the premises which remain under his control are clearly defined. Thus the agreement should stipulate that the landlord shall keep the roof in good repair, the staircases in good condition, and well lighted, etc.

LAW REPORTS.

Court of Appeal.

(Before the Master of the Rolls and Lords Justices Phillimore and Warrington.)

Building Scheme: Alleged Infringement of Covenant:

Wood v. Jacobs and others.

This case was heard on the 17th ult. upon the appeal of the defendants from a judgment of Mr. Justice Neville in the Chancery Division.

The action was brought by Mr. S. M. Wood, of East Dulwich, against the Shirt and Collar Dressing Company, of Beckenham, Kent, for an injunction to restrain the defendants from erecting a workshop or any building other than a dwelling-house on a piece of land abutting upon Avenue-road, Beckenham, in alleged breach of their covenant. Plaintiff also asked for a mandatory order that any building which had been erected upon the site should be forthwith pulled down and removed.

It appeared that the Beckenham Park Estate was acquired in 1868 by the Second Birkbeck Building Society, who laid it out on a building scheme in plots, imposing certain conditions and stipulations upon purchasers. One of these stipulations was that no factory should be erected upon the estate except at a distance of 60 ft. from the boundary line. The plaintiff purchased a corner plot at the corner of Avenue and Mackenzie roads, and the adjoining plot was purchased by Mr. B. Appleton and Mr. L. S. Smith, who traded as the Penge Shirt Manufacturing Company, and who, as the Shirt and Collar Dressing Company, erected a pyjama and shirt factory on their plot. It was erected on a line with the dwelling-houses and not 60 ft. from the boundary line.

Evidence was given to show that the defendants employed a number of women at the factory who worked sewing-machines, the power being supplied by electricity from a three-horse-power motor, and the plaintiff's contention was that this was a factory within the meaning of the stipulation.

For the defence it was submitted that the defendants' premises were not a factory within the meaning of the stipulation and in the sense intended by the vendors, and defendants' evidence was to the effect that there was no noise to be heard, and no vibration noticeable outside the building.

Mr. Justice Neville held that it was clear a building scheme was intended, and that the building in question was a "factory" within the meaning of the covenant. He accordingly granted the injunction claimed, with costs; but as the work the defendants were doing was a useful one, his Lordship stayed the operation of the injunction until three months after the declaration of peace.

Mr. C. E. Jenkins, K.C., and Mr. Carr appeared in support of the appeal; and Mr. Bramwell Davis, K.C., and Mr. H. Langford Lewis for the respondent (the plaintiff).

At the conclusion of the arguments their Lordships affirmed the decision of Mr. Justice Neville, and dismissed the appeal, with costs.

Official Referee's Court.

(Before Mr. Verey.)

Action to Recover Possession of Houses: Hind v. Nowell.

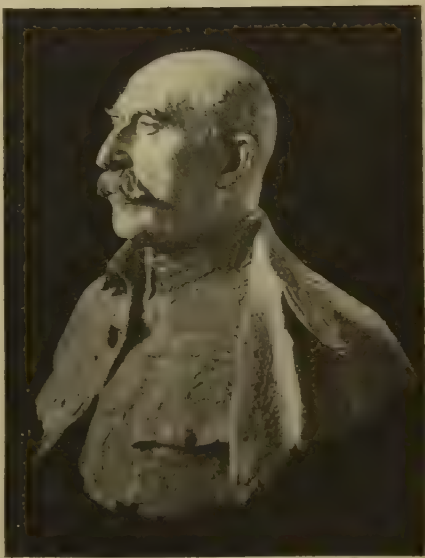
This was an action to recover possession of fourteen houses in Skidmore-street, Stepney, four houses in Ernest-street, Stepney, and a mission-hall adjoining, all of which were held under a common title. There was also a claim for damages for breach of covenant of the lease in failing to keep the premises in repair, which was the ground of forfeiture. The defendant in his defence denied that the plaintiff had suffered damage, and said that delay in carrying out the repairs was consequent upon the difficulty of finding labour owing to the war. The plaintiff purchased the leasehold interest in the property from the ground landlord in July, 1907, and the lease will expire on March 25, 1917. After the purchase, dilapidation notices were served upon the then tenants and the premises were put into proper repair, but they had not been kept so. A sub-lease was granted to the defendant in March of last year for the sum of £5, but in buying dilapidated property, said counsel, he was taking upon himself considerable liability. He had paid the ground rent up to Christmas of last year, but it was accepted without prejudice to any claim for breach of covenant.

Evidence was given on both sides, and in the result,

The Referee found that there had been a breach of covenant, which entitled the plaintiff to the forfeiture of the lease, and in giving him possession of the premises he awarded him £40 damages and £5 for mean profits, with costs.

SOME MODERN SCULPTURE.

We illustrate three sculpture subjects, one of which, the portrait bust of the Duke of Connaught, illustrates the naturalistic school of sculpture and is as realistic as a photograph, while the statue of Manu, designed as an accessory to the New Court House, New York, has the dignity attaching to the well-considered use of convention in art. Between the two types is the delightful girl's head, executed by Mr. W. Reid Dick, which is instinct with life and character.



H.R.H. The Duke of Connaught: Portrait Bust.

Mr. Frederick Lessore, Sculptor.

THE BUILDING TRADE.

A FUTURE OPPORTUNITY.

TOWN improvement schemes and the formation of garden cities will add to the architectural appearance of our country in the future, and, it is to be hoped, will be financially possible at no remote date after the conclusion of peace; but there is a smaller and humbler field that might with advantage be exploited in the near future, which would involve comparatively small expense, and which should offer opportunity for the investment of private money with fair certainty of a good return. We refer to the conversion of many houses in London and in other large towns which have been built in days when service was both easier to obtain and cheaper than it is now. There is much house property which is still too good to be pulled down and too inconvenient to let readily, as it stands, at adequate rents, which might well be converted by the rearrangement of kitchen premises, cutting up bedrooms, the introduction of gas cooking and other labour-saving appliances; and, as the demand for cheaper houses in which service can be economised will be more and more acute after the war, there will be room for the work of small syndicates and companies, who would act on the competent advice of architects, and buy or lease property which is becoming derelict, with a view to improving it. It would, in fact, pay both gas and other heating engineers to subscribe capital for such purposes, as they could demonstrate the great advance which modern invention has put at our disposal, and there are whole tracts of London which might revive in capital value and in popularity if intelligent means were taken to do away with the disadvantages which have led to an exodus of population from them.

St. John's Wood, Belsize Park, and Maida Vale, and similar districts, might be more popular if they were taken in hand, for in a great many cases the exodus to newer and more outlying districts is simply caused by the impossibility of living comfortably without more service than it is easy to obtain. There are many advantages of existing houses in such districts over the slighter structures now put up. The walls are usually thicker, the rooms larger, while bedrooms are kept clear of the roof projections, which make the introduction of ordinary furniture in newer and smaller houses a Chinese puzzle. Among the rearrangements which are often possible at small expense is the treatment of the front space and garden in rear of the houses in many London districts, for with a little thought and management quite a small garden may add immensely to the appearance of a house—a few flagged pathways and the trimming up and repair of boundary walls, and the planting of a few trees will frequently convert a small garden into a pleasing and dignified addition to a house instead of suggesting, as it often does, an untidy drying-ground for washing. A good deal has been done by individuals who have found it not an unprofitable investment of capital and ingenuity, but the advantage of doing such work on a larger scale is manifest. Extensive advertising, which is beyond the reach of the individual, is possible for a syndicate or company, and the same processes by which a new building district is made known and popular could be applied equally to making known the reconstruction of older districts. Like other building ventures it requires care and knowledge, but given these we believe it will afford a good return to the careful and experienced speculator.

SURVEY OF LONDON.

The Local Government Records and Museums Committee of the London County Council have decided to discontinue the printing of further volumes in the series of the Survey of London until after the conclusion of the war.

NEW ZEALAND FEDERATED BUILDERS' AND CONTRACTORS' INDUSTRIAL ASSOCIATION OF EMPLOYERS.

THE fifteenth and sixteenth annual meetings were held in the New Zealand Employers' Federation Rooms, Wellington, on November 2, 1915, and following days.

The President, in the course of his address, said the present effect of the war on the building trade had not been serious in New Zealand, although prices for materials had in some instances increased considerably. It was hard to say what the after-effects of the war might be, but it was quite apparent that much money that in the ordinary course of business would have been devoted to regular commercial undertakings was being diverted into the stream of the war. He considered that, while due care and prudent economy should be exercised, it would be unwise to follow a plan of over-cautiousness and pessimism.

The Secretary presented a Report covering the two years ended October 31, 1915, from which the following information is taken:—

Architects' Bill.

This measure was completely redrafted when submitted to the 1913 Parliament, and as passed into law it does not contain any such provisions as were originally proposed that will prove repugnant to builders or will hamper them in carrying out their legitimate rights as builders and contractors. For this members are largely indebted to the valuable and practical evidence given before the Committee of the House of Representatives dealing with the Bill by members of the Executive.

Wages Protection and Contractors' Lien Act.

Earnest representations were made to the Government, urging amendment of this Act in the direction of affording better protection to contractors' interests. The promise had been given by the Prime Minister that an amending measure would be brought before Parliament, and the Committee has good reason to believe that a Bill remodelling the whole Act was in preparation. Owing first to the strike, and later to the outbreak of war, the pressure of work on Ministers and Parliament was too great to allow of the whole subject being dealt with, and it is doubtful if anything will be done to further amend the Act during the continuance of the war. Although the Committee has not succeeded in securing the introduction of a comprehensive measure dealing with the whole subject of the Lien Act, it has pleasure in placing on record the successful efforts put forth to have clearly defined what constitutes "completion of contract" within the meaning of the Act. Owing to the ambiguous wording of sect. 59 of the Act, and to an opinion expressed by one of our Supreme Court Judges, certain owners and architects claimed that contractors were not entitled to payment of the full amount of contract (less 5 per cent. for maintenance) until the expiry of the maintenance period, and they therefore retained 30 per cent. of the contract prices for four months. This interpretation was causing serious loss and hardship to a number of builders. Steps were taken to move for the introduction of a short amending Bill (which subsequently became law), which would clearly indicate that when a job was actually finished the contract was completed, notwithstanding a covenant in the condition for maintenance of the premises after completion.

Arbitration Act.

The Executive has at different times submitted proposed amendments of this Act to the Government and to the Employers' Fed tion, several of which have met with appro and have found their way into Bills submi to Parliament, but have not yet been placed the Statute Book. An important altera sought is the increase to five years as the pe for which the court may make an award. amendment is of special importance to ma builders and contractors, as the making of s period awards means that employers are sooner through with one dispute than ano is upon them. Continual annoyance friction has resulted from the tardy issu copies of new awards, and this was rece emphasised in a case, when two months elap before the awards were supplied. Applica to the court to have the date of the aw altered was unsuccessful, but His Honour Justice Stringer promised he would recomm to the Labour Department that amendm of the Act be secured to provide that an aw should not begin to operate until the expir a limited period of time after employers received their copies of award. It is hoped Honour's recommendations will be acted u as it is certain it will remove an injustice save a large amount of friction and trouble.

General Conditions of Contract.

On the whole the present general conditi of contract have proved of great value to trade, and, although there are some omissi and deficiencies in them, they nevertheless affording contractors a measure of protec and recognition of the rights of the trade previously obtaining in the Dominion. term of five years, for which they were set has now expired, and they are again ope revision should either architects or builders for another Conference.

Among the matters considered and reso upon by the annual meetings were the foll ing:—The question of the formulation scheme of insurance for builders' fire accident risks; liability of main contractor loss by fire incurred by a sub-contractor recommendation to employers to take as m apprentices as possible; an instruction to Executive to endeavour to secure provision the industrial conciliation and Arbitration that will make awards more definitely bin on persons who employ tradesmen but who not original parties to the awards; as to need for architects to secure building and o permits from local authorities before cal for tenders; that the Institute of Architect asked to agree that tenders for all contract opened in the presence of any builders who be present when tenders close; the neces that all work carried out by contract should under the control of the principal contracto

red plans of proposed extensions by the
and North-Western Railway Company.

Galway.—Arrangements are being made for holding a bazaar in the summer in aid of the funds for the proposed new cathedral.

Glasgow.—Glasgow Dean of Guild Court has granted the following linings:—Messrs. F. D. Cowieson & Co., structural engineers. 3-25, Charles-street. St. Rollox, to erect a workshop there; Sir John Stirling-Maxwell. Bart., to form a street and sewers off Glasserton-road. Newlands; Messrs. A. & J. Main & Co., Ltd., Clydesdale Ironworks. Possilpark. to erect additions to Germiston Ironworks. Petershill-road; the Steel Company of Scotland. to erect an electric power station at Blochairn Ironworks; Messrs. Barr & Stroud, Ltd., Caxton-street. Anniesland. to make additions to their works there; Mr. David Lamb. builder, 65, Possil-road, to erect a terrace of twelve self-contained dwelling-houses on the north side of Glasserton-road, Newlands; Messrs. Redpath, Brown, & Co., Ltd., constructional engineers, 19, Waterloo-street, to erect buildings in North Canal Bank-street.

Gravesend.—A deputation from the Gravesend Corporation is to wait upon the Port of London Authority in regard to a proposal to construct at Gravesend a deep-water wharf.

Hartlepool.—The Hartlepools Port Sanitary Authority has instructed the Borough Engineer to prepare a plan for a pavilion at the hospital.

Hitchin.—The U.D.C. has passed plans of additions to the Woolpack public-house. submitted by Mr. J. W. Bailey. on behalf of Messrs. E. K. & H. Fordham, Ltd.

Hornsey.—The following plans have been approved by the T.C.:—Conservatory at the rear of No. 72, Oakfield-road. Stroud Green. by Mr. G. Inwood. of Priory-avenue; for the conversion of stabling into two garages. at No. 6, Avenue-mews. Muswell Hill. by Messrs. Edmondsons, Ltd.; for entrance lobby at the rear of Nos. 75 and 77, Crouch Hall-road. Crouch End. by Mr. H. D. Evans. Hornsey Rise; for the conversion of one house into two houses. at Hope Cottage. North-hill. Highgate. by Messrs. Southcott & Co., Southwood-lane; for the conversion of stabling into classrooms at the rear of Southwood Hall. Highgate. by Messrs. Prickett & Ellis. High-street. Highgate.

Huddersfield.—At a recent meeting of the T.C. the Borough Engineer submitted ten different specimen plans of houses proposed to be erected for the working classes. together with estimates of the cost. and it was resolved that plans B. E. and H be approved. and that the Engineer prepare the necessary plans and specifications, etc., with a view of advertising for tenders.

Linthwaite.—Plans passed by the U.D.C.:—For extension to No. 1 and No. 2 mills at Union Mills. Milnsbridge, for Messrs. John Crowther & Sons; motor garage at Manchester-road. for Messrs. James Dyson & Sons; wood store shed at Manchester-road, for Messrs. W. H. Dyson & Son.

Merthyr.—Merthyr Corporation Housing Committee has asked the Architect to make a report upon a town planning scheme.

Ossett.—Plans passed by the T.C.:—Coal-places at Westfield Mill. for Messrs. Jonas Glover. Ltd.; alterations to Ivy Bank. Station-road. for Mr. T. G. Brook; alterations and additions to an electrical sub-station at Spring Mill. for Messrs. Bickle Bros.; Sub-station in Wesley-street. for Messrs. E. Clay & Son.

Richmond (Yorks).—The R.D.C. has approved a plan for a cottage at Dalton. for Mr. Harland.

Skipton.—The U.D.C. has agreed that certain alterations be carried out at the slaughter-houses. involving the provision of lairage accommodation. a shed for carts. etc.

Smethwick.—Plans approved by the T.C.:—Offices in Rolfe-street. for Messrs. S. W. B. Stephen & Co.; new shop. for Messrs. Muntz's Metal Company, Ltd., Alma-street; pickling shop. French-walls. Alma-street. for Messrs. Muntz's Metal Company. Ltd.; power house at St. George's Works. for Messrs. Guest. Keen. & Nettlefolds. Ltd.; motor garage and porch in Suffrage-street. for Mr. F. Collins; extension to works in Rolfe-street. for Messrs. Harper. Son. & Bean; outbuildings. rear of Picture House. Bearwood-road. for Mr. E. Hewitson; motor house for Mr. J. T. Brockhouse. United Counties Bank. High-street; garage for Messrs. Chance Bros. & Co., Ltd., in Spon-lane; alterations to No. 63. Stoney-lane. for Mr. G. Willey.

Southgate.—A preliminary L.G.B. inquiry was recently held at the Southgate Council Offices, to consider the proposal of the Council to adopt a town plan.

Spain.—Tenders will be opened at the "Casa Consistorial," Ferrol. on March 22, for the carrying out of certain street paving and drainage works in that town. at an estimated cost of 110,616 pesetas (about £4,400). The *Gaceta* of February 11 notifies that tenders will be opened thirty days from that date by the municipal authorities at Linares. for the construction of a school at that town. at an estimated cost of 99,681 pesetas (about £3,990). The "Dirección General de Obras Públicas" has authorised the municipal authorities of San Sebastian to construct a bridge over the mouth of the Rio Urumea.

Stafford.—The L.G.B. has issued an order for the extension of the borough of Stafford. The boundary submitted by the Corporation has. with three small exceptions. been approved by the Board. Stafford Castle and a strip of land adjoining has been excluded. and there is a slight diversion in Tillington and another in Hopton and Coton.

Stockton.—The Plans Committee of the U.C. has passed plans for six houses for Mr. J. W. Bainbridge in Mowbray-road. Norton.

Toronto.—The Iperial Trade Correspondent at Toronto reports that a Chicago company. which has a large departmental store in Toronto. is having erected in that city. for use in connection with its mail order business. a fireproof building eleven stories high, with a floor space of approximately 9 acres.

Tranent.—The T.C. has passed the amended plans for the new picture house.

Ventnor.—The R.D.C. has approved plans deposited by Messrs. Ingram & Sons of a porch to an office in Dudley-road. for Mr. H. Milligan. and a plan redeposited by Mr. E. A. Vincent of proposed alterations to No. 79. High-street. for the trustees of the Congregational Church.

GENERAL BUILDING NEWS.

ARBROATH INFIRMARY.

Arbroath new Infirmary buildings are practically completed, and the formal opening of the institution will take place shortly. The buildings have cost a sum of £14,000. The original proposal was to reconstruct the original infirmary buildings, but the subscriptions received for this purpose exceeded what was required for the purposes of reconstruction, and the directors decided to pull down the old structure and build an entirely new infirmary. The buildings have been erected according to plans prepared by Mr. Hugh Gavin, architect, Arbroath.

TRADE NEWS.

No. 4, Fitchett's-court, Noble-street, E.C., is being rebuilt by Messrs. E. A. Roome & Co., of Crown Works, Urswick-road, Hackney, under the superintendence of Messrs. Davis & Emanuel and Henry C. Smart, architects, of 2, Finsbury-circus, E.C.

Boyle's latest patent "air-pump" ventilators have been adopted for the Council Schools, Resolven, Glam.

The Herbert Strutt Schools, Belper, are being supplied with Shorland's patent exhaust roof ventilators by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

PATENTS.

APPLICATIONS PUBLISHED.*

643 of 1915.—James Jackson, Stanley Greenhalgh, and Andrew Robertson: Jigging or shaking conveyors.

745 of 1915.—Edward James Davison and Charles Percival Tooley: Chequer bricks as used in the chequering chambers of carburetted water-gas plants or coke oven chambers.

816 of 1915.—Fred Willard Hargrave and James Augustus Wheeler: Methods of forming fireproof building construction, such as doors, trim, or the like.

868 of 1915.—Edward Frederick Stimson: Cut-out storage tanks for use in connection with hot-water apparatus.

899 of 1915.—John Jack and William Jack: Machines for drying and tarring road metal and other analogous purposes.

932 of 1915.—Ernest Richard Royston (Fulcher Concrete Block and Paving Company, U.S.): Moulding-presses.

983 of 1915.—Thomas McRae, jun.: Roof ventilators.

1,069 of 1915.—Wilfred Hiram Lowe and John Shepherd: Lever locks and latches.

1,220 of 1915.—Frederick William Edlin: Construction of floors and the like.

1,301 of 1915.—Arthur Gerald Gray: Apparatus for scrubbing floors, decks, and the like.

1,422 of 1915.—Arthur William Curran Schelff and Thomas Stamps Allden: Ferro-concrete structures.

1,527 of 1915.—Henry Frederick Farrar Sedgwick: Machines for bending metal sheets, and for like purposes.

1,532 of 1915.—Wilberforce Cobbett: Means and apparatus for the automatic discharge of sewage and liquids from tanks, sewers, or other receptacles.

1,858 of 1915.—Ernest Sidney Dupree: Fittings for spring roller-blinds.

List of Competitions, Contracts, etc.

For some contracts still open, but not included in this List, see previous issues. **Those with an asterisk (*) are advertised in this number:** Competitions, —; Contracts, iv., vi.; Public Appointments, —; Auction Sales, xx. Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

⁂ It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur.

Contracts.

BUILDING AND PAINTING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

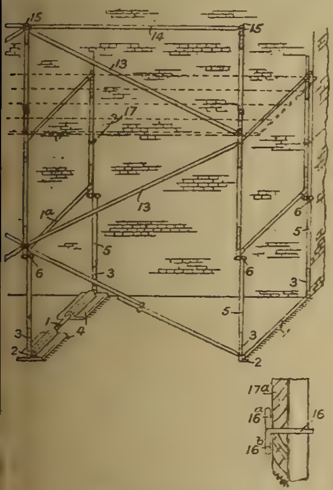
◆

SELECTED PATENTS.

46 of 1914.—John Parsons, jun., and min Claude Andrew: Scaffolding.

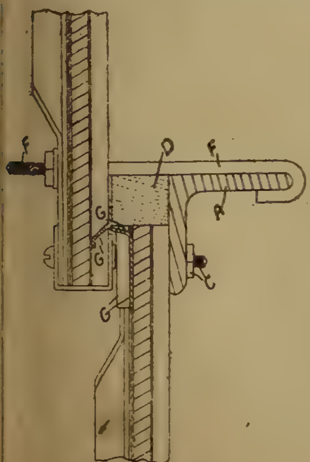
s relates to scaffolding and the like of the comprising metal tubes connected by s, and comprises, in combination, vertical r members 5 connected by dowels, and bars 1, 1ª, oblique stays 13 having eyes gage the dowels, tie-plates 17 secured to all and engaging the vertical members, djustable clamps 6 for the lower vertical blique members to adjust the scaffolding egularities of the ground. The dowels connected to the cross-bars by angle or ts 2, and the lower cross-bars may be ed with self-adjusting feet 4. A guard is secured to the upper members 5 by 5. Platforms may be formed by placing across the bars 1. Material is retained the platforms by boards 17ª held in by clips 16 having holes to receive the l members and formed with bent tongues ". The sections of the scaffolding may ng about the vertical members to conform contour of the building.



15,346 of 1914.

30 of 1914.—Frank Wilford Mellowes erbert Faulston: Glazing roofs.

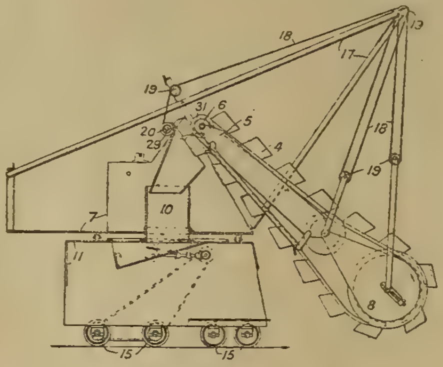
relates to a method of glazing roofs ch overlapping ends of metal glazing- re spaced apart by wood distance-pieces D which rest on the purlins A and may be provided with flashing strips G with flanges G^1 bearing against the underside of the adjacent glass panes. The glazing-bars are secured to the purlins by hooked bolts F, engaging flanges or projections on the lower edge of the purlins, and bolts and nuts C or other known connections.



16,730 of 1914.

19,760 of 1914.—David Thomas: Excavating and like machines.

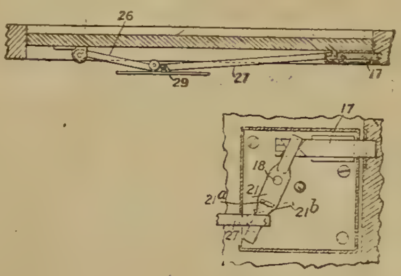
This relates to an excavating, dredging, or quarrying machine having an endless travelling chain of buckets 4 carried by an arm made in two parts 5, 8, pivoted together and supported by a pivot 6 and by tackle 18, which passes over pulleys 19 on a frame of jib 17. The material is discharged through a hollow king-post 10, which forms the connection between the upper carriage 7 supporting the jib and the lower carriage 11 running on wheels 15 and made saddle-shaped so as to pass over a truck, etc., to receive the material. The upper carriage may turn on wheels about the post 10. The gear-wheel 31 for the chain of buckets, and the shaft 29 for the drums 20 to which the lifting-tackle is connected, are both driven from the main shaft by spur and worm gearing. Suitable clutches connect the drums 20 with their shaft.



19,760 of 1914.

19,819 of 1914.—George Henry Stanbridge: Emergency-exit fastenings.

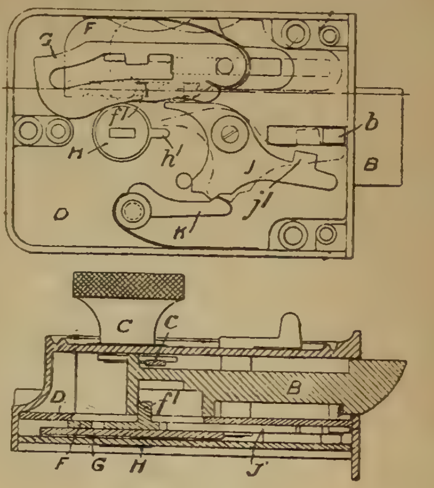
This relates to emergency-exit fastenings in which a sliding bolt 17 is connected by a lever 21 on an intermediate pivot 18 to a toggle linkage 26, 27, so as to be drawn when the linkage is straightened by pressure on the plate 29 at the joint. The arms of the intermediate lever 21 engage flared slots in the bolt and toggle. Ribs 21^a, 21^b on the lever and casing keep the lever in one plane.



19,819 of 1914.

20,061 of 1914.—Charles William Tonks, Enoch Tonks, and George Arthur Tonks (trading as Enoch Tonks & Sons): Door latches.

This relates to a cylinder door latch B for operation from the outside by a key inserted in a cylinder H, through the medium of a runner plate F mounted to slide on a slotted division plate D within the lock casing. The latch is operated from inside by a follower *c* on a handle C, and from outside by a string f^1 on the runner plate F, which is itself operated by an arm h^1 on the cylinder H under the control of the usual lever or levers G. An additional lever J, also operated by the arm h^1, and controlled by a spring-pressed pawl K, serves to lock the latch B, when shot, by a projection j^1 thereon engaging a stump *b* on the latch

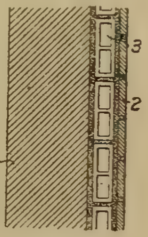


20,061 of 1914.

An ordinary night latch may similarly be adapted as a cylinder latch.

20,463 of 1914.—Wallace Clement Sabine and Rafael Guastavino: Sound-deadening in buildings.

This relates to a sound-absorbing wall or ceiling surface consisting of porous ceramic tiles 2 secured by cement to the main structure 1, with or without the interposition of hollow blocks 3. The pores of the tiles 2 are exposed at the surface. The tiles are formed from clay 25 per cent., vegetable-bearing earth 65 per cent., and a flux such as feldspar 10 per cent., the materials being pulverised and mixed in a slightly moist condition, then screened with a screen having about sixteen meshes to an inch. The powdered material is next pressed in moulds to cause the particles to cohere, and, to prevent the closing of the pores in the pressing, finely pulverised vegetable-bearing earth is sprinkled on the bottom of the mould or on the upper face of the material in the mould, whichever forms the exposed face of the tile. The blanks are then dried and burned in a kiln, the temperature of which is raised gradually to about 2,100 deg. Fahr., and then slowly cooled.



20,463 of 1914.

21,092 of 1914.—August Edward Eilertsen: Flushing drains.

This relates to a nozzle 13 having a constricted outlet 14, and secured in the wall of a soil waste or other drain-pipe by a nut 12. The outer end is adapted for connection to a high-pressure hose-pipe. The nozzle may be turned into the reverse position shown by dotted lines.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to THE BUILDER LTD., and *not* to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

◆

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us *not later than 2 p.m. on Wednesday.* [N.B.—We cannot publish Tenders unless the amount of the Tender is stated.]

* Denotes *accepted.* † Denotes *provisionally accepted.*

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

L. CX.—No. 3814. MARCH 10, 1916.

THE EFFECT OF BUILDINGS UPON CHARACTER.

THIS is a large subject, and one at first sight too absurd or too abstruse for argument, but, now that historians are beginning to take account of social environment, a brief consideration of some of the obvious facts may not be uninteresting.

here is no more commonly received belief, especially e South of England, than that the dweller in the North urdy, rugged, and of superior virtue. The hope was tless helped by the eighteenth-century reformer's und belief in the superior simplicity and virtue to be among the inhabitants of a hilly country. Switzerland of course, the most conspicuous example, but there are s nearer home, such as the novelist Amory's enthusiasm e virtues of Richmondshire farmers and Peacock's admira- of the pastoral simplicity prevailing among the Welsh tains. It is not too much to say, however, that the ession is felt, more or less consciously, by every traveller gh the northern counties, and is in great measure due to ffect produced by stone walls in place of hedges, stone es in place of brick. These houses are altogether different aracter from the exquisite stone-built farms of Oxfordshire Gloucester, which suggest an atmosphere of home and e such as hardly can be found elsewhere. The stone of North is grim and grey, not toned with hues of yellow silver, but as severe and cold after a hundred years as after nth of builded life. The North, too, does not love gardens, this adds to the severity of the effect: clearly this people o need of outward pleasures, it has enough in itself and s hills. And this is true. The rugged stone is only a ol of the rugged character, and no reader of the lives of lotte and Emily Brontë will feel that the grey houses e North were without their influence on those lovers of moors.

he Kent or Surrey cottage, nestling red-roofed in its trees, symbol not only to us but to the world of the wealth and e and happiness of England. It stands for centuries ttled peace; it is picturesque, and its beauty is increased e charm of garden and creeper and the fruitful background rchard or hops. So, too, the golden stone of Somerset well the mellow character of the countryside, the warm ts of the country folk and the soft western speech.

odern historians of the classical world are beginning to dwell he contrasting influences of the glorious temples and small squalid houses even of Greek cities, and of Athens herself, he combination of vast blocks of flats, piled with truly an confusion and disregard of sanitary laws in the poorer ters of Rome with the exquisite villas and gardens of wealthy; and it is scarcely unfair to see in Calcutta, with arrens of native quarters and its palaces of Chowringhee, odern parallel to ancient Rome. Of the effects of mud or led huts, such as were almost universal in the remoter s of agricultural Ireland before the Famine and in ent Egypt, it is needless to say much; apart from the al result in the narrower sense of the word, character ound to be affected by the fact that houses can be built out effort, replaced with little toil; when it is not th while taking trouble over what is so little permanent ill not be worth while to do anything save under compulsion, pt in the easiest way possible, and the qualities of enter- e, thrift, and exertion will die for want of nourishment. ay be a false impression, but it is one not easy to shake off, if Barnwell were not built of the cheapest whitish-yellow k and roofed with the poorest slate the authorities of bridge would have less to contend against, and it is freely itted that the outward hideousness of the packed colliery ge is directly responsible for much of the evil of colliery life.

No one who knows anything of the life of a cathedral town, whether in England or abroad, is ignorant of the moral effect of one grand building in a place otherwise perhaps destitute of beauty. There is the conscious pride which shows itself in the ready direction of the stranger; there is the unconscious standard set up in the mind by which other buildings will be judged in future years. Yet "beauty is in the eye of the beholder," and the grim houses of the dales will be as dear to those who love them as any Italian palace to its heirs, if only they are set in places that call out love. The solitary farm in Mossdale or Cotterdale will inspire a passion of love that the southerner may not always feel for his fairer and softer land.

This instinctive love of a house, a district, a country, is one that under certain conditions is too easily lost, and its loss is one of the saddest and most constant features of modern industrialism. Unfortunately it remains to be proved whether the Garden City, so incomparably better in other ways, can supply the loss and counteract the inveterate habit of moving their quarters so dear to the working classes, whose "sticks," and not whose habitation, are home. Nor can it be doubted that the growth of flats is against the recovery of the home instinct. As far as sentiment goes, one flat is as good as another, and the type of building with common lifts and staircases is not one to influence character in any positive way, at least in modern England. Every poster of every cheap land company points the moral that the Englishman's home is a house, and, this being so, it is clear that the English character, among all who can exercise a free choice, still demands a house of its own—that is, it recognises the effect of even private buildings upon character.

The first part of the Report of the Departmental Committee on Land Settlement for Soldiers and Sailors, issued on February 8, aims at the revival of this instinct on a large scale. That the creation of a true rural population is the most urgent social need of the day few will deny, but whether the proposed scheme of tenancy as against ownership is the right one is at best doubtful. Cottage and farm are rarely home unless the man who lives in them is owner or what we may call hereditary tenant under a great landowner, and when the Committee alleges in one place that their chosen system is desirable because the tenant is practically sure of permanency in his holding, and in another that it is desirable because, if unsatisfactory, he can easily be got rid of, it arouses the suspicion that a plan combining such very opposite advantages might in practice prove to have neither. Be this as it may, let us hope that at all costs the standardised cottage will be avoided when the scheme takes effect, and this can only be secured by insisting on the supervision of plans by an architect of standing in every district to ensure some regard to the style of material prevalent in that district, and thus ensuring that the cottages of the new settlers are not only watertight but humble and therefore home.

Great public buildings are the expression of a great nation, their loss is the world's; if the Hôtel de Ville, the Palais de Justice, Ste Gudule are doomed to share the fate of Louvain and of Reims, the world will feel for Brussels as she feels for the other victims of German culture, and will plan an empty and impotent revenge in the erection at German cost of other buildings to take their place when the final reckoning shall come. But the world will be the poorer, and one of the consoling lessons of the war is to be drawn from the universal cry that the spirit embodied in the lost buildings is greater than the might of arms, that the best part of the world's inheritance is the visible legacy of the past. And what is this but the recognition of our subject, the effect of buildings upon character?

NOTES.

The First Atelier Exhibition. Owing to the fact that so many of the working members of the Atelier are absent on military duty, it was thought advisable to discontinue the ordinary monthly exhibitions and to hold them once in every two months, so as to ensure a more interesting exhibition. The last exhibition and criticism, held on February 23, fully justified this policy. Quite a large show was the result, and, what is even more satisfactory, the more important designs were of an unusually high standard. The first monthly *projet* was a group of almshouses in the country with accommodation for both sexes. In this competition a "mention" was won by Mr. L. H. Bucknell for a very pleasing group of buildings arranged round a central court. The subject of the second *projet* was a universal store situated on an island site in the shopping centre of a large town. Here Mr. Bucknell did even better, obtaining the unusual distinction of a "first mention" for an excellent design in which the main essentials of the problem had been thoroughly grasped and worked out in a direct and straightforward manner. The result was a building of much character and charm. Mr. Tomlin also obtained a "mention" in this competition. The twelve-hour subjects did not attain so high a standard as the monthly *projets*, but Mr. Meldrum was awarded a "mention" for a design for the treatment of a retaining wall and staircases supporting and connecting the upper and lower terraces in a public park. The Patron, Mr. A. J. Davis, introduced a new feature into the proceedings by giving some general remarks on the subject under discussion before criticising each design in detail. A very pleasant evening was participated in by several friends of the members, including Mr. C. F. A. Voysey and Captain Bennett Goldney, M.P.

Carpenters' Hall Lectures. On February 1 Mr. MacColl, LL.D., the Keeper of the Wallace Collection, gave a most admirable lecture on the "Work and Life of Alfred Stevens," illustrated by lantern slides and by some of Stevens's original drawings, two of which we hope to reproduce shortly. Stevens was one of those great artists who make one regret the shortness of human life, for he spent years in preparing himself for coping with great problems, and died before he had accomplished enough to show the world how great an artist was in their midst. Even his greatest work, the Wellington Memorial in St. Paul's, was completed some years after his death, and, although he was recognised in his lifetime as an artist of rare gifts by a few, he did not live to reap the rewards to which he was justly entitled. The lecturer drew attention to the fact that when the competition for the memorial was held Stevens only received the sixth place, and it was not until the various schemes had been carefully examined that it was discovered most of them would not suit the intended position. Stevens had carefully designed his scheme so that it would be fittingly framed by the arch over, and it was due to this fact more than the recognition by the jury of the intrinsic merit of his work that he secured the commission. Stevens's training, like that of the artists of the Renaissance, had fitted him to cope with problems of art in every branch, and he was more closely connected with them in sympathy and knowledge than with the lesser men of his own age.

Criticism Again. A correspondent tells us that the critic who discourses on the failure of the decorative scheme of St. Andrew's Chapel is justified because his name evidently begins with "K." Neither this letter nor "M.P." nor any other combination of letters seems to us to justify anyone in likening the work of Mr. Weir to the decoration of a bath-room. Whatever the eminence of the critic may be, such remarks savour of abuse and are in bad taste. Our critic objects to Mr. Weir's scheme because the marbles which cover the lower portions of the wall are too light in tone and too cold in colour for the mosaics above, and, although we do not agree with him, his views express genuine and legitimate criticism. But, whether Mr. Weir's work satisfies competent critics or not, a fair-minded man would admit that there is abundant evidence of scholarly refinement and knowledge which cannot be associated with the decoration of a bath-room or underground convenience! We doubt whether many are really in sympathy with the use of either marble or mosaic in a decorative scheme, which are associated in our mind with the environment of southern lands, and we have little doubt that in the minds of many there is a prejudice against the use of marble except in climates bathed with sunlight and warmth. Those who feel this—and we sympathise with them—would rather see the brickwork of the church left as it is and decoration applied in the form of pictures and hangings. But such was not Bentley's scheme, which was to design a church that appeals to many as somewhat of an exotic on English soil. We are conscious of this exotic quality when we see any part of the church completely decorated, and we believe it to be this rather than the failure of decoration *per se* which leaves so many dissatisfied. Marble is an unsuitable material in this climate; it suggests coldness, its surface becomes covered with condensation in our climate, and it needs a bright clear atmosphere to be really effective. Bentley lived we might have been justified in wishing that he designed a building the decorative scheme of which depended ne on marble nor mosaic. The form in which coloured decoration c used in its full magnificence will remain as it was in past a coloured glass framed in a uniform setting of masonry or brick

---

Anzac-on-Sea. We may be sceptical, and if events prove us wrong we shall at once acknowledge it, but, th the promoters of Anzac-on-Sea have given thought to the discovery of a name which would charm, we d whether those who hold property in Brighton or Hastings ne try to dispose of it yet. The fortunate owners of plots seem ha satisfy; we should have thought that a deposit of a few gu for a title to their property was the merest bagatelle, to be forg in dreams of ecstasy over the thought that they had freehold in the new resort, but they appear to be sordid and ca individuals, possessing no idealism or enthusiasm. In fact, have disobeyed the injunctions of Holy Writ, for, having put their to the plough of inspiration to invent a fitting title, they have lo backwards and thought of their petty deposits. We shall ho be able to announce that the syndicate is going to hold a compet for the laying out and beautification of the coming seaside resor we trust the cupidity of the speculator will not be allowed to the attractions of Anzac-on-Sea, and that the promoters wil find themselves at sea in their calculations.

[Photo: Geo. Trotma

Wren's Churches: St. Lawrence Jewry.

E LONDON CHURCHES F WREN AND LATER RCHITECTS OF THE ENAISSANCE.

No. XIX.—St. Lawrence Jewry.

church of St. Lawrence Jewry occupies ral position in the City of London, fronting ng-street, Gresham-street, and Guildhall- The name "Jewry" recalls the fact that strict was occupied by the Jews in mediæval prior to their expulsion by Edward I., he position of one of the boundaries of wish settlement is still recalled by the Old Jewry.

he former church many eminent citizens buried, including Richard Rich, from were descended the Earls of Warwick olland; Sir Geoffry Boleyn, who was Lord and the ancestor of Queen Elizabeth; ir Richard Gresham, as well as Dame Avenon, who was married three times, to Sir Alexander Avenon, Lord in 1569. The Lord Mayor and Cor- n attend a service in the church lly on Michaelmas Day before proceeding election of the Lord Mayor for the coming

present church was built in 1671, but was mpleted till 1680; it cost over £11,870, one of the largest and most important Wren's work. It contains a nave and one he greater portion of which was converted large choir vestry a century ago. It is oped that at some future date the whole space may be again thrown into the the architectural effect of which would atly enhanced thereby. Internally, the is one of those finished with a flat ceiling, d by ribs, the cove round it being groined the clerestory windows. Beneath this ange of semicircular-headed windows, n which are Corinthian pilasters.

design is commonplace, but, owing to an lly fine organ gallery and door-cases, the internal effect is rich and pleasing, though greatly marred by glass of poor design and colour. The reredos constitutes a blot on the church, and is an example of the damage effected by the use of absolutely incongruous detail.

The vestry is a beautiful room, panelled in oak, with an interesting chimneypiece, and two very fine door-cases, as well as an enriched ceiling, painted by Sir John Thornhill.

Externally the church is treated in a more monumental manner than most of Wren's churches, especially the east end fronting on King-street, with its engaged columns and pilasters. The other fronts of the church are simpler, the lead-covered steeple carrying out the general effect of vigour and masculinity that distinguish the church, which is suggestive of the best work subsequent to Wren rather than characteristic of his work. The living is in the gift of the Master and Fellows of Balliol College.

No. XX.—St. Magnus, London Bridge.

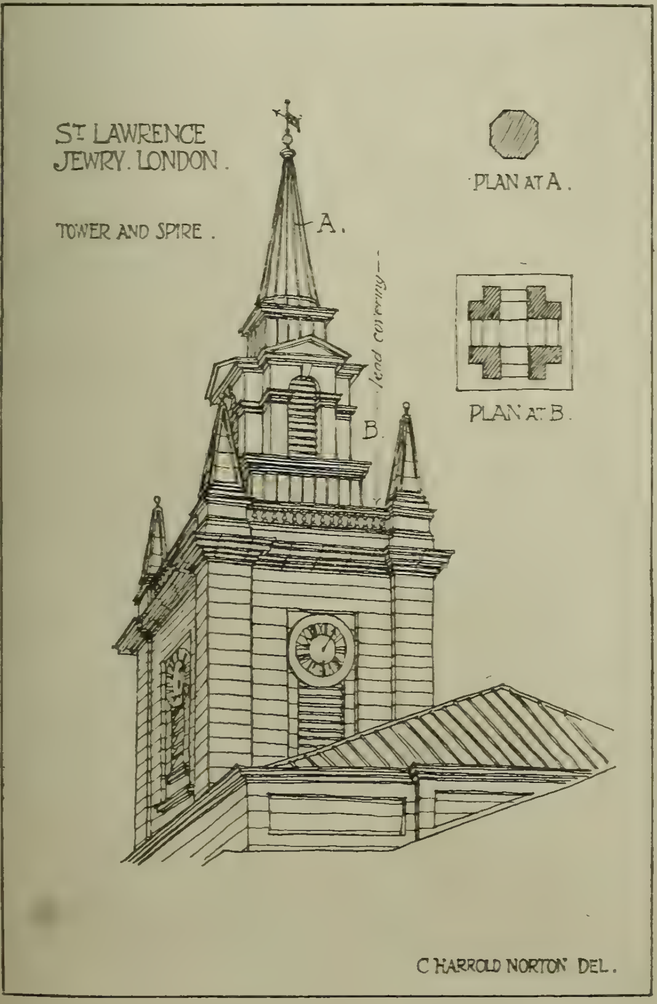
The church of St. Magnus the Martyr is situated on the south side of Thames-street, below the level of the north approach to London Bridge. The church of St. Margaret, New Fish-street, was not rebuilt after the Fire, and its site was utilised for the building of the Monument, its parish being united with that of St. Magnus.

Miles Coverdale, who translated the Scriptures, was a rector of St. Magnus from 1563-1566, and among those buried there was Henry Yeuele or de Yeverley, who was Master Mason to Edward III., Richard II., and Henry IV., and was employed by Richard at Westminster Hall.

The present church was completed in 1676, but the steeple was only added in 1705, a fact which probably accounts for its design, which is unlike most of Wren's work and inferior to it. The domed steeple is reminiscent of the work of Archer and other later architects, lacking the charm and dignity of most of Wren's compositions.

The external treatment of the church is dignified and pleasing, but internally it is one of the barest and least pleasing of the architect's interiors; nor does there seem to be any adequate reason for the singular and unusual irregular spacing of the columns on plan. The staircases leading up to the west gallery are good examples of contemporary woodwork.

The church of St. Michael, Crooked-lane, was pulled down to make room for the approaches to new London Bridge in 1831, and its parish united to that of St. Magnus. St. Michael being one of the "Peculiars" of the Archbishop of Canterbury, the united living is now presented alternately by the Archbishop of Canterbury and the Bishop of London.



◆

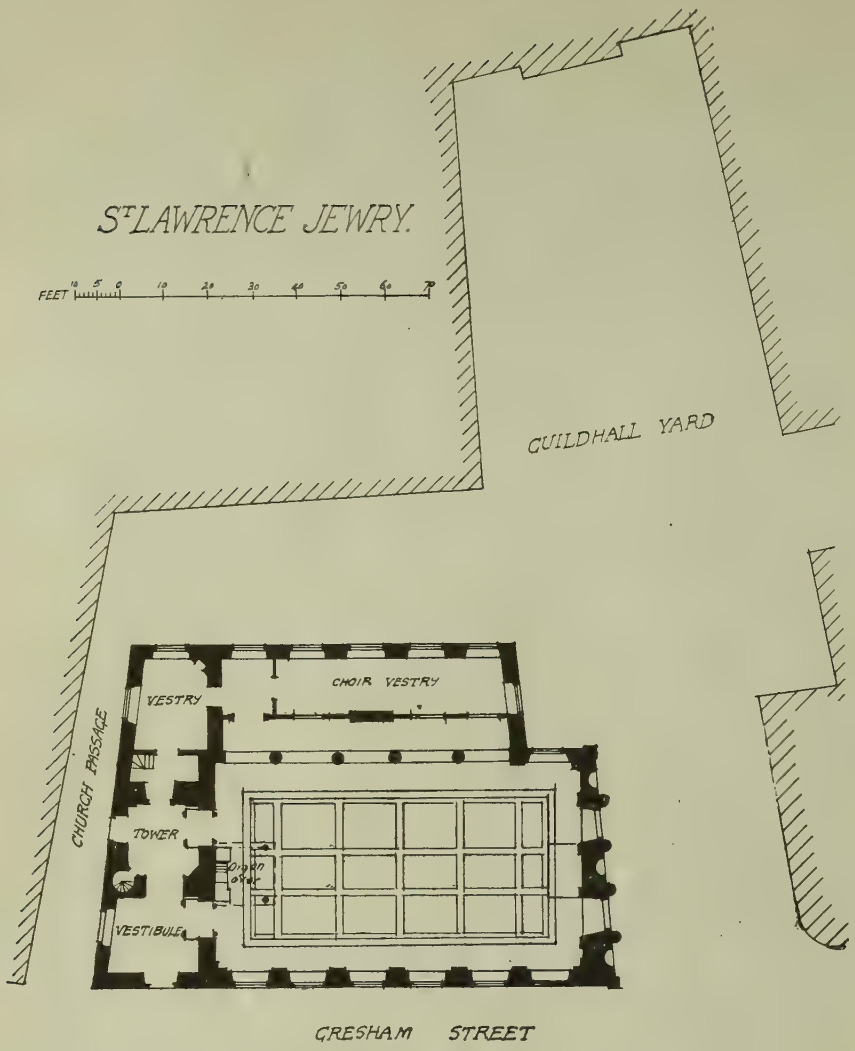
LUTON SECONDARY SCHOOL.

In November, 1914, conditions for a limited competition for a new Secondary School for Girls were issued to selected competitors by the Bedfordshire County Council, and the award has just been made; but we understand the execution of the work is deferred until after the war. The accommodation to be provided was twelve classrooms for twenty-five, an assembly hall, art, chemistry, physics, domestic science, and needlework rooms, three music-rooms, staff-rooms, cloak-rooms, changing-rooms, and other customary adjuncts, as well as caretaker's living accommodation.

In the additional particulars furnished to each competitor it was stated that provision was to be made for at least four tennis courts, one being a hard court, and a hockey ground was also to be provided. The question of future extension had "not been considered, but should not be entirely lost sight of by competitors." The site forms an oblong, 327 ft. long by 150 ft. broad, with irregular ends parallel to Marlborough-road, and reached from it by a neck 150 ft. deep by 120 ft. broad. The larger portion of the site is almost level; the "approach neck" slopes upward from the front in Marlborough-road, about 7 ft. being the extreme difference in levels.

Most of the competitors, including the architects placed first and second, have not utilised the neck except for an approach; but some have placed their buildings partly upon it, while one competitor, No. 7, submits two schemes in each of which the school is kept almost entirely on the neck, thus leaving the parallelogram at the back free—a plan possessing very great advantages, but which makes it necessary to arrange the school on one story, because direct south light is not available. This and the nature of the levels have probably induced most of the competitors to place their buildings in rear, this enabling them to light their classrooms from the south. But since the treatment of the neck as a mere approach is wasteful, no competitor, excepting No. 7, has adopted a single-story type (which we feel to be the best solution of the problem of a school wherever its adoption is possible), because sufficient playground space would not be left. In the design placed first, the authors of which are Messrs. J. R. Brown & Son, of Luton, the whole of the accommodation is arranged on either side of a central corridor, running nearly east and west. On the south side of the corridor are placed five of the classrooms on the ground floor and seven on the first floor. The assembly hall occupies a central position on the north side of corridor opposite the central entrance, and on each side of it are grouped the cloak and changing rooms, the junior and senior entrances being at the ends of the main corridor, the science-rooms over them on first floor, and the art-room over the assembly hall. Near the east end of the building and connected with it by a covered way is a block containing on the ground floor the dining-room, caretaker's rooms, and music-rooms, and on the first floor the domestic science rooms. The elevations are simply and appropriately treated, the planning is straightforward and good, and the scheme carefully worked out, and one which will make a good school.

The authors of the design placed second also submit a well-considered plan in which three classrooms face south and the remaining four east and west; over the assembly hall are the physics and chemistry laboratories, so placed as to utilise a common balance, store,



Wren's Churches. (*See page* 193.)

(Reproduced from the Ordnance Survey Plan, with the sanction of the Controller of H.M. Stationery Office.)

and dark room. The staircases appear at first sight to be somewhat wasteful, but are well worked out for the various levels and conveniently placed next the assembly hall. The outline of the plan is cramped, the main block with assembly-rooms and classrooms being to the front, and an extension at each side to the rear containing the changing-rooms, lavatories, and dining and art rooms. The buildings are kept close to the north boundary of site, helping the planning of playgrounds and hockey field, which are better arranged than in the design placed first; on the other hand, the planning of the buildings is not on such simple lines. No. 6 has sent in a scheme in which the accommodation is divided into two sections—a building containing the assembly hall and classrooms placed on the main part of the site, the remaining rooms contained in a building occupying the neck, the girls' entrances being placed in a connecting way between the two buildings. The scheme, though ingenious, is too complicated; but the architectural treatment and draughtsmanship are of a high order.

In No. 1 the assembly hall has its axis at right angles to the remainder of the school, which forms a T-shaped block with entrances to either side of the assembly hall in the angles. In No. 2 the buildings are arranged round two quadrangles, with the assembly hall between them. No. 3 forms a scheme planned round a single quadrangle, the elevations being pleasingly treated. No. 4 is a scattered scheme, but is the only one which has not some distinct merit, for the level of the designs submitted is an unusually good one.

Although both the designs placed first and second are good schemes, we prefer that submitted by No. 7 for reasons we have already mentioned—because it makes fullest use of th site and because it is a one-storied plan. Ther must needs be division of opinion on suc matters, and the best that can be expect is that an assessor should choose a good desig conforming to the type which he prefers, whic has evidently been done here.

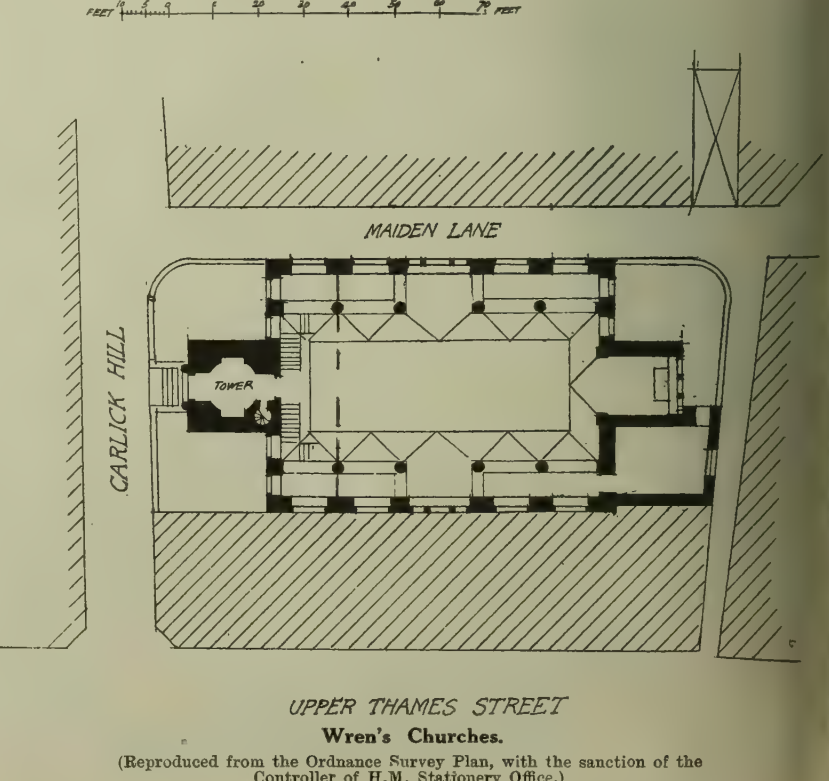
In No. 7 the classrooms face east and wes being cross-lighted and ventilated. Betwee the classrooms and corridors on either side is central space which in scheme A contains th assembly hall, flanked at either end by areas in scheme B by the art-room at one end and th library at the other, with a central area betwee In scheme B the assembly hall is a positio occupied in scheme A by the art-room. T right and left of the main block, and connect with it by covered ways, are annexes containin the science-rooms on the west and the dinin hall and caretaker's rooms on the east sid These blocks and the northern end of th central building impinge on the larger pa of the site, all else being contained in the "neck. The slope of the site is ingeniously utilised b placing the changing-rooms and domest science rooms under the southern end of th main block. The elevational treatment is of simple Georgian character, and is very pleasin while devoid of the least extravagance. W shall illustrate this design shortly; for while has not met with the assessors' approva we consider it one of the best examples secondary school planning we have seen, an an illustration of the way in which utilitaria buildings may be absolutely architectural character.

◆

ARCHITECTURAL SOCIETIES.

The Architectural Association of Ireland.

Mr. Harold Leask, President, Architectur Association of Ireland (Dublin), presided at lecture given by Mr. Horace F. O'Rourk Licentiate R.I.B.A., architect, under the auspic of the Association, on "Town Housing." In th course of an interesting address Mr. O'Rourk said that to those interested in the moder revival in Ireland, whether of her languag industries, or arts, it must be apparent th there was a great need for constantly urging her people the dire necessity of proper housi for the working classes in her cities and town For the architectural student of housing a town planning Irish cities and towns afford



Wren's Churches.

(Reproduced from the Ordnance Survey Plan, with the sanction of the Controller of H.M. Stationery Office.)

it scope for theory but little opportunity practice. There were numerous areas in of the principal cities of Ireland which in r housing conditions were a disgrace to lisation, and to find a match for them we st go to the dens of pauper foreigners in the t End of London. The real cause of the blem in towns was probably the townling movement, but that cause or explanation not universally accepted. The Corporation Dublin had found it necessary to appoint a cial Housing Committee, which for several rs had been struggling with a difficult and plicated task in face of the most skilful and nuous opposition. The problem in Dublin very grave, and a great work yet remained e accomplished in the city to alleviate the and brighten the homes of our less-favoured w-citizens. Benefits conferred on them ted in favour of the whole community.

BOOKS.

tt and Redman's Income Tax Law. By the te J. TIDD PRATT, Q.C. Ninth edition, by OSEPH HAWORTH REDMAN. (London: utterworth & Co., Bell-yard, E.C., and haw & Sons, Fetter-lane, E.C. Price 9s. 6d. et.)

is not surprising that this is the ninth ion of the late author's work, the subsidiary of which is "An Analysis of the Income Acts, with decisions, illustrations, and lanatory notes, and a chapter on Excess Profits Duty." That even a careful work on such a subject should constantly need revision and expansion at a time when startling and often confusing changes are made in the law is obvious, and the authors of the volume before us appear to have done all that is possible to explain the present law on the subject. The arrangement of the book leaves little or nothing to be desired, and with a good index and bold index side-headings to the page paragraphs, the information sought for can easily be found.

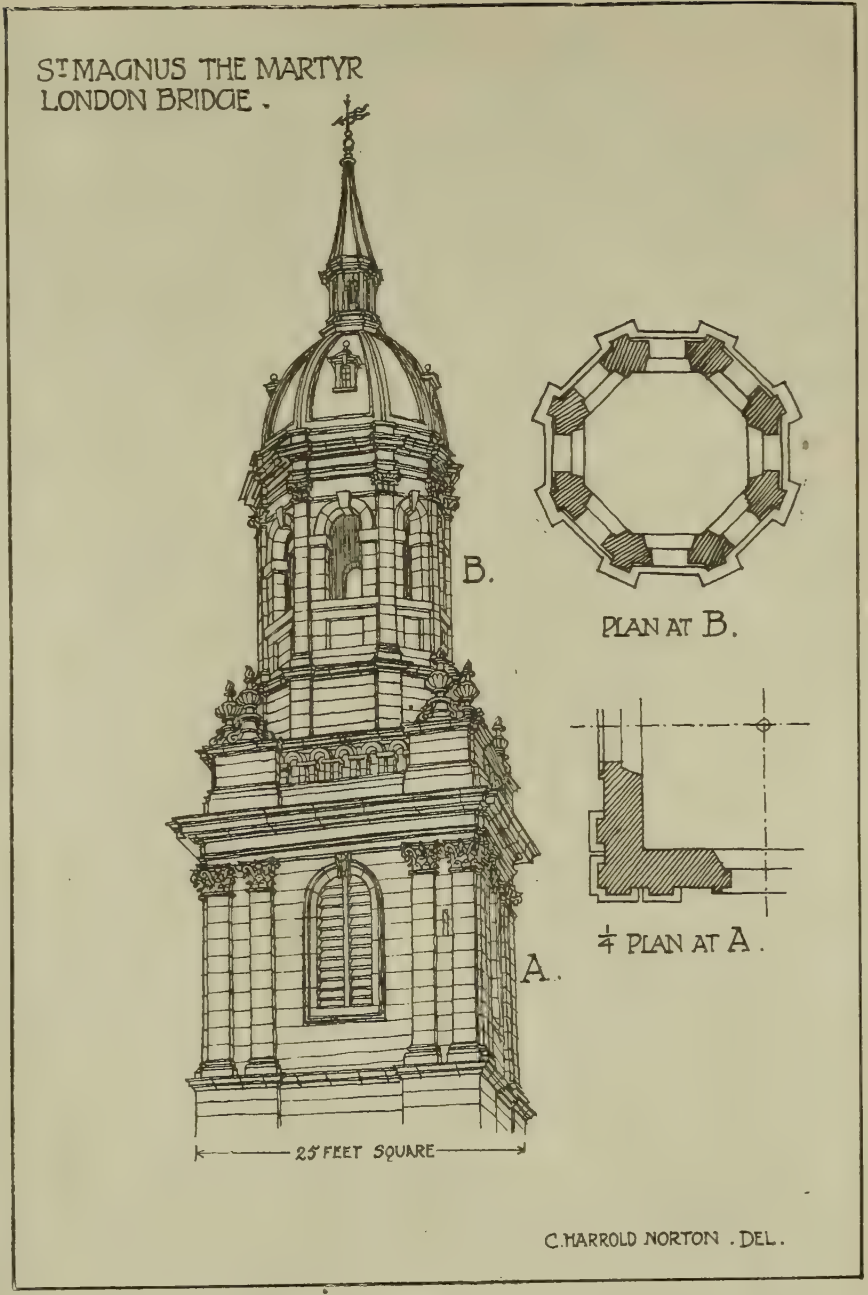
Wren's Churches: St. Magnus, London Bridge. (*See page* 193.)



Wren's Churches. (*See page* 193.)

Laxton's Builders' Price-Book for 1916. Originally compiled by WILLIAM LAXTON. Ninety-ninth edition. (London: Printed and published by Kelly's Directories, Ltd., 182, 183, and 184, High Holborn, W.C.)

FOR a work approaching its centenary one can feel a respect due to age, but we are afraid that the editor has not had the courage to attempt anything like a general revision. Our sympathies are with him, but we think he might have done a little more with the items most seriously affected, viz., those relating to woodwork. The prices given are practically those obtaining before the war started, and although it would not be possible, taking into account the rapid rise, to have brought them anything like up to date—*i.e.*, the date of publication—we think that something might have been done. In the case of steel construction, prices have been omitted as being of little value at the present time owing to the shortness of supply. This we can understand, but if prices are given at all they should at least approximate to those obtaining as late as possible up to the time of going to press. However, we hope that by the time this work reaches its hundredth edition things may be more settled and that the Editor will celebrate the event by a thorough overhauling of the prices.

BOOKS RECEIVED.

BUTTERWORTH'S WORKMEN'S COMPENSATION CASES. Vol. VIII. (London: Butterworth & Co. 12s. 6d. net.)

NOTES ON THE FENLAND. By T. McKenny Hughes, M.A., F.R.S., with a description of the Shippea Man, by Alexander Macalister, M.A., F.R.S., M.D., Sc.D. (London: Cambridge University Press. 6d. net.)

THE CATHEDRALS OF GREAT BRITAIN: THEIR HISTORY AND ARCHITECTURE. By the Rev. P. H. Ditchfield, M.A., F.S.A., F.R.Hist.S. (London: J. M. Dent & Sons, Ltd. 5s. net.)

THE SURVEYORS' INSTITUTION.

A meeting of this Institution was held on Monday at No. 12, Great George-street, Westminster, S.W., when Mr. G. Turville Brown read a paper on "The Management of Estates in Mining Districts, and Mineral Valuations." In the course of his remarks he said:—

This paper deals almost exclusively with districts producing coal and iron, in comparison with which the districts raising other minerals are relatively unimportant. Stone, sand, clay, chalk, and limestone for building and for cement and lime making are so widespread in their occurrence that many of the places which produce them are outside what may be called "mineral districts."

Upon our coal supplies two Commissions, one appointed in 1870 and the other in 1901, have reported. From the monumental volumes they produced it may be gathered that for several hundred years to come we need have no fear as to the sufficiency of our supplies. A more careful examination of their pages shows, too, that, although a great deal of the coal which can be most easily and cheaply mined has been got, there is no reason to fear that the competitive power of our collieries as against foreign coal will be impaired during the years to come.

The state of development to which Britain has been brought by the capital expended in railways and docks, and in all other ways which tend to economy and efficiency in production and transport, and the geographical position of the mines, will probably more than compensate for greater difficulties in obtaining the coal.

The districts which are likely to increase their output are the great South Yorkshire, Nottinghamshire, and Derbyshire field and the steam and anthracite coalfield of South Wales. From these two fields it is certain that, if the output is wanted, considerably greater supplies can be obtained in the future.

On the subject of iron ore the position is far less satisfactory. Up to about the middle of the nineteenth century the great bulk of iron ore which was used in this country was obtained in the coal measures themselves, but the discovery of methods of using leaner ores and the increase in the cost of underground labour have led to a great cessation in the use of Carboniferous iron ores. Their place has been taken partly by ores of Oolitic origin, quarried or mined in the Midlands and in the Cleveland Hills in Yorkshire, by hæmatite ore from Cumberland, and by Spanish and other ores imported from abroad.

Any mining surveyor who could discover further sources of ore which could be worked cheaply, and which would give a metallic content of 30 per cent. or over, within reach of our coalfields, would be doing his country a very great service. It would appear that the Government might well initiate an inquiry into the matter of our iron ore supplies on the lines of the two Coal Commissions. Failing fresh discoveries of iron ore in these islands, it is probable that future smelting works will be placed on the coasts in places where foreign ore can be put direct from ocean-going ships into the furnaces.

Our output of coal, which before the war had reached about 270,000,000 tons, is the second largest output from any country in the world, being only exceeded by the United States of America. On the other hand, our position as iron and steel makers is by no means so satisfactory, as we hold only the third place, being easily outstripped in the race by both the United States of America and Germany. Our production of iron and steel has not kept pace with our output of coal.

In methods of production we are quite in the front rank, though it is worth noting that in the United States a far greater proportion of the mineral (coal and ore) is got by machines than is the case here, and that in the case of difficult sinkings we have still a good deal to learn from the Continent.

Subsidence and support are matters on which great difficulties arise, and in connection with which the tact and knowledge of an experienced agent are of the greatest value. There is no such thing as working coal by modern methods without letting down the surface of the ground, although on the Continent, by what is known as hydraulic packing, it has been found possible to take out an entire stratum without material disturbance of the surface. The difficulties of applying such a method here would probably be so great as to render it impossible to work the mineral at a profit.

Two general rules of subsidence may be noted. The first is that the strata always break at right angles to the dip, so that workings do not affect, except in the case of absolutely flat strata, the surface of the ground immediately above them, but a point where a line drawn at right angles to their dip strikes the surface. This, in the case of deep mines lying at high angles, is a very considerable distance from a point vertically above the working, and this fact is especially important in view of the legal cases affecting subsidence.

The second rule (which is not such an "axiom" as the first) is that the amount by which the surface falls is usually about two-thirds of the thickness of the stratum extracted—*i.e.*, if a 3-ft. seam is taken out the surface falls about 2 ft.

In the case of agricultural land, mere subsidence does not always cause damage unless drainage is interfered with, though there are cases where, by disturbance of the strata beneath, the land ceases to have the power of holding its subsoil water, and consequently becomes so liable to burn in the sun that its value is diminished.

With regard to buildings, if it is desired to mine under land already built on or to build on land to be mined under, the advice of the mining engineer should always be sought. Buildings should be placed, if possible, with their length parallel to the level course or strike of the strata, so that their shorter side is on the dip. They should be put on concrete rafts, reinforced in the case of heavy buildings. A useful reinforcement can be made by inserting in the lower part of the concrete raft a spiral of an old colliery winding rope with old rails put in across it at evenly spaced intervals.

It is a great question whether, when coal is to be worked on the "long wall" principle, pillars should be left even for the support of such important buildings as churches and mansions. But if it is decided to leave pillars it is of the first importance to leave them large enough. A small pillar left for the protection of a building is probably a greater danger than no pillar at all.

Changes in the character of a district, owing to the sinking of mines and the establishment of industrial works, present problems which are more or less akin to those caused by the development of our towns. It may be remarked that the Housing and Town Planning Acts are likely to be of service in the colliery districts, where their wide adoption may be looked for.

Water supply and sewerage questions are of peculiar difficulty in mining districts, owing to the countryside becoming just sufficiently developed to require these facilities without a sufficient increase in rateable value being created to enable them to be supplied without imposing a heavy burden on the community.

It would seem that the time has almost arrived when some further and more comprehensive methods of dealing with water supplies and sewage in each watershed should be adopted when the population has reached a given number per square mile of the watershed. The multiplication of small water undertakings and small sewage disposal works over a district served by one main channel must surely be wrong, and when one knows what pains our great cities have taken to ensure that their water supplies are derived from sources above all possible risk of contamination, the conclusion must be drawn that anything which can be done to give smaller communities some of the advantages which greater centres of population can command must be for good. Boards dealing with both pure and foul water channels and works in each watershed would go nearer to being able to provide such facilities than urban and rural district councils. They would also be far better able to use the drastic powers of the Rivers Pollution Acts than the county councils, some of whom do not attempt to follow the example set them by the Thames Conservators.

With the growth of public knowledge a public taste in matters of hygiene. comfo and climate it is not easy to see how our mini districts are to be repopulated by members the upper and middle classes. One thi surveyors can do, however: they can use eve endeavour to prevent big and medium-siz houses becoming or remaining empty by keepi them up and by letting them even at caretaki rents, and they can set their faces strong against anything being done which unnecessar renders the country unfit to live in. A gre deal can, and will, be done in the future in t way of remedying nuisances and eyesores. notable sign of the times is the replacing of t old ideas of colliery villages with examples su as Brodsworth and Elthorne.

◆

CORRESPONDENCE.

Germany at Work.

Sir,—In your very appreciative "Note" my show of "Germany at Work" in t Leicester Galleries you make a few observatio which I can scarcely agree with, and hope you will not mind my calling your atte tion to your question, the *raison d'être* building the gasometers of Berlin into castl I thought the reasons for so doing were knov to and approved by all engineers, sanita authorities, and taxpayers; and the mo enthusiastic praise that I heard came fro an eminent architect—not a German—w had seen them. The reasons for so buildi them are that all the fumes, stinks, and b products which vitiate or are wasted on th country's county council protected air, a consumed or made use of, while the buildin are most appropriate and show exactly wh is inside. As to the Tower Bridge not being the design of it—capable of defence, as a me outsider I would say it is the only bridge London designed by a man who knew had to bridge a great commercial river, and n block it up and render it useless for navigatio as all the others do from London Bridge Richmond.

As to German work failing in value wh completed, if when this damnable war is ov you will visit Berlin and compare Wernheim building with Harrods' or Selfridge's, or t great new street in Hamburg which runs fro the Rathaus to the new station with Aldwy and Kingsway, some idea of the "value of this new architecture may be borne in you. And this comparison can be continu in every sort of German architectural, industria and engineering work. Joseph Pennell.

FIFTY YEARS AGO.

Competitions.

Prudhoe Convalescent Home.—The desi of Mr. Thomas Oliver, architect, of Newcastl upon-Tyne, has obtained the first premiu for the proposed new seaside hospital i tended to be built at Whitley, Northumbe land, in memory of the late Duke Northumberland. There were in all fou sets; the other competitors being Messr J. Johnstone and A. M. Dunn, of Newcastle and Mr. F. R. Haswell, of North Shields.

Bristol Assize Court Competition.

We hear that only one design was receive by the Committee for this proposed buildin sent in by Messrs. Pope & Bindon, all th other architects of the city and neighbou hood remaining firm to the determinatio expressed in their memorial lately publishe in these pages. The result has been tha the one design has been returned unopene to its authors; and, we believe, a new com petition, founded upon the printed sugge tions of the Alliance, will be ere long decide upon. We have reason to know that th Council are earnestly anxious to obtain proposition that would worthily settle th question.

[*** From the *Builder* of March 1 1866.—Ed.]

ENERAL NEWS.

Taxation of Advertisements.

is understood that, in preparation for the ng Budget, the Treasury are considering the ticability of taxing advertisement hoardings.

West Ham Garden City.

r their rehousing scheme in West Ham Port of London Authority have decided proceed upon garden-city lines, and have dy provided 204 cottages in and adjoining e Regent's-lane.

uilders' Clerks' Benevolent Institution.

the annual general meeting on February 29, Frederick Shingleton, M.V.O., was unani-sly elected President for the ensuing year. succeeds Mr. Frederick Higgs, who was tily thanked for his help in procuring a list of donors at a most trying time.

"The Purpose of Discovery."

The Purpose of Discovery: or the Spirit Service of Science," which Professor R. A. ory has written and Messrs. Macmillan & are about to publish, is to display the lity of scientific work, the value of scientific hod, and the practical service of results ined by scientific research.

The Athenæum Club.

he Committee of the Athenæum Club have ed the following under the rule which owers the annual election of a certain ber of persons "of distinguished eminence cience, literature, the arts, or for public ices":—The Rev. Ernest William Barnes, ., Sc.D., F.R.S., Master of the Temple; Ernest Newton, A.R.A., President of the al Institute of British Architects; and essor Thomas Frederick Tout, F.B.A., essor of Mediæval and Ecclesiastical History he Victoria University of Manchester.

Bothwell Castle, Haddington.

othwell Castle, it is stated, has been acquired purchaser, and will shortly be demolished. a massive pile, with a picturesque roundel ne corner abutting upon the street, and looking the River Tyne. It has long been practically ruinous condition internally. s an example of the old strongly-built, ll-chambered type of Scottish burghal llings that were a compromise between the and the homestead, and it comprises resting architectural features. It contains remains of the massive stone fireplace in chamber known as "Bothwell's kitchen."

London Fair.

he London Fair and Market will be held at Royal Agricultural Hall from the 14th he 24th of this month. As soon as the war menced the International Trade Exhibitions, ., began to prepare the London Fair with iew to assisting in the capture of German Austrian markets, and now the Agricul-l Hall, the adjoining Gilbey Hall, and the eries are to be stocked with the manu-ures of various lands, the products of ny countries being totally excluded. Chief ng the sections will be leather and fancy ds of all descriptions, printing, publishing, arts, and such hardware and art metal luctions as have been officially approved.

Stained-Glass Work.

year ago Mr. Henry Holiday exhibited e stained-glass windows carried out from his gns for the west windows of the Church of Thomas, Warlington, U.S.A. He has now pleted the sixteen aisle lights, four of ch were on view at his studio. They ict "Wycliffe," "Queen Anne," "Cranmer," "Laud." The richness and combination colouring is again of a very high standard, should blend well with those already in ition. The representation of the costume "Queen Anne" is particularly successful. the same time Mr. Holiday showed a fresco nting which will form the frieze in the apse St. Benedict, Birmingham. It consists mainly four figures of angels, about 6 ft. high, which spaced between the clerestory windows. e dome of the apse has already been painted Mr. Holiday.

Fall of Chalk.

Two thousand tons of chalk fell close to the main road at Northfleet, near Gravesend, recently.

Housing, Swansea.

At Swansea Corporation Housing Committee it was stated that so great was the demand for houses that 1,000 people were on the books waiting for vacant houses.

Piccadilly Site, Manchester.

At the Manchester City Council recently the question of the Infirmary site was raised by Sir Charles Behrens, and a suggestion was made that as the Tramways Committee were negotiating for the purchase of property off Mosley-street the site should be used partly for a tramway centre. The matter is to be again discussed three months hence, when a report on traffic congestion may be considered.

Laboratory Tests.

At a meeting of the Society of Engineers (Incorporated) on Monday, Mr. Reginald Brown read a paper entitled "Sewage and its Precipitation: Facts and Fallacies from Laboratory and Practical Tests." Laboratory tests, he contended, must be checked by tests on a practical scale before any definite line could be followed or any definite statement made as to the value of a precipitant, and a laboratory test is only sufficient in so far as it gives results under ideal conditions, which are by no means met with in actual practice of sewage disposal.

The British Journal Photographic Almanac, 1916.

This yearly volume, edited by Mr. George E. Brown, F.I.C., is a guide in all photographic matters. It contains a compendium of practical hints, gleaned from the British and foreign papers, formulæ and tables for the various photographic methods, and an article by the Editor dealing with the working of printing processes in a way which the beginner will find instructive. A feature is a review of the resources of British firms in the manufacture of photographic plates, papers, and apparatus. The price of the book, which is published by Messrs. H Greenwood & Co., Ltd., Wellington-street, Strand, W.C., is 1s. net.

Royal Society of Arts.

The prize of £10 and a Silver Medal, offered under the Peter Le Neve Foster Trust by the Royal Society of Arts for an essay on "Zinc: its Production and Industrial Applications," has been awarded to Mr. J. C. Moulden, A.R.S.M., M.Inst.M.M., of Seaton Carew, Co. Durham. Honourable mention has also been awarded to Mr. Ernest Alfred Smith, A.R.S.M., M.Inst.M.M., Deputy Assay Master of the Sheffield Assay Office, for his essay. The adjudicators, on whose recommendation the award was made, reported that the two essays above mentioned were distinctly superior to the others, several of which, nevertheless, were of interest and value. An essay by Mr. Ramji Das Vaishya, of Gwalior, Central India, contained a good deal of information with regard to the production and utilisation of the metal in the East Indies. The prize essay will be read in abstract at one of the meetings of the Society after Easter.

Princess of Wales' Scholarships.

It was announced in Circular 920 that the award of Princess of Wales' Scholarships might be suspended for 1916, or, if continued, would be made on conditions to be announced later. The Board of Education have now decided that, as the National Competition is not this year available as a basis for award, they will, if there is a candidate of sufficient merit, award at least one Princess of Wales' Scholarship on the basis of the Examinations in Art to be held in 1916. The conditions of this Scholarship, both as regards award and tenure, will be identical with those fixed for Local Scholarships by the Interim Regulations for Awards in Art, subject to the following modifications specially affecting the Princess of Wales' Scholarship:—(*a*) The Scholarship will be of the value of £24 for three years; (*b*) it will only be open to women students of Schools of Art who have not previously held a Local Scholarship or a Princess of Wales' Scholarship. The Board may, if they think fit, award a second Scholarship of £24, tenable for one year only.

Mr. W. Eve.

We regret to record the death of Mr. William Eve, senior partner in the firm of Messrs. Wm. Eve & Sons, land agents, surveyors, and architects, of 10, Union-court, Old Broad-street, E.C., which took place on February 13, at Stoke Newington, aged eighty years. Mr. Eve was one of the earlier members of the Surveyors' Institution, being elected a Fellow in 1868, the year of its inception, whilst he was well known as a London rating surveyor. Mr. Eve was born in Silsoe, Beds. He served his articles with the late Mr. Edward Ryde, and had carried on business in Union-court, City, for considerably over fifty years. The funeral service was held at St. Mary's, Stoke Newington, followed by interment at Highgate Cemetery.

Civil Service Estimates.

A portion of the Civil Service Estimates for the coming financial year has been issued. The estimates are for Class 1 (Public Works and Buildings), and the total sum asked for is £2,948,582. The original net estimates for the expiring year were £4,062,740, but the vote for works for the relief of unemployment, totalling £251,000, was withdrawn, and this, with other economies, reduced the total actual grants for Class 1 to £3,818,830. The estimates now published thus show a net decrease of £870,248. Only one vote in the whole class shows an increase, viz., rates on Government property, £25,500. The principal decreases are:—Public buildings, Great Britain, £219,200; revenue buildings, £207,400; surveys of the United Kingdom, £118,900; and public works and buildings, Ireland, £89,000.

Prudential Assurance Company.

From the sixty-seventh annual Report of the Prudential Assurance Company, Ltd., for the year ending December 31, 1915, we take the following:—The number of policies issued in the Ordinary Branch during the year was 68,785, assuring the sum of £6,619,218, and producing a new annual premium income of £457,217. The premiums received during the year were £5,157,516, being an increase of £121,891 over the year 1914. The claims of the year amounted to £4,330,768, of which £145,536 was in respect of war claims. The number of deaths was 11,358. The number of endowment assurances matured was 25,559, the premium income of which was £137,797. The number of policies in force at the end of the year was 935,514. In the Industrial Branch the premiums received during the year were £8,506,063, being an increase of £329,861. The claims of the year amounted to £3,938,596, of which £425,499 was in respect of 25,379 war claims. The bonus additions included in the claims amounted to £276,721. The total number of claims and surrenders, including 15,505 endowment assurances matured, was 429,510. The number of free policies granted during the year to those policyholders of five years' standing and upwards who desired to discontinue their payments was 88,384, the number in force being 1,984,523. The number of free policies which became claims during the year was 51,417. The total number of policies in force in this branch at the end of the year was 20,859,887—their average duration exceeds thirteen years. The war claims paid during the year in both branches number 26,826 and amount to £571,035. The total paid up to the present on this account since the outbreak of war exceeds £750,000 in respect of over 34,500 claims. In the General Branch, under the Sickness Insurance Tables the premiums received during the year were £9,065, and £5,468 was paid in sickness claims. The whole of the fund of £16,955 is reserved for future liabilities. The assets of the company, in all branches, as shown in the balance sheet, are £94,794,798, being an increase of £3,592,454 over those of 1914. The Staff Provident Fund, which was founded in 1898 for the benefit of the outdoor staff, now amounts to £270,637. During the year the company obtained power to substitute a Memorandum and Articles of Association for its Deed of Settlement and Regulations. The new Memorandum enables the company to extend its objects in the direction of undertaking various other classes of insurance (excluding marine and employers' liability insurance) in addition to life assurance.

ILLUSTRATIONS.

Wren's Churches.

WE give reproductions of the plates of St. Lawrence Jewry and St. Magnus, London Bridge, from "The Churches of Sir Christopher Wren," by J. Clayton, published by Messrs. Longmans, Green, Brown, & Longmans, which we give by the courtesy of Messrs. Longmans, Green, & Co. Further notes on the two churches and a plan of St. James, Garlickhythe, will be found on page 193.

The Bristol Branch of the Royal Colonial Institute.

THE restricted and angular area of the available site which was curtailed to improve the entrance to the Victoria Rooms and for a public widening of Whiteladies-road was a governing factor in the planning of the building, and admitted of no waste of space on the ground level where the lines of the boundaries are followed. Above the ground floor the main building is formed with rectangular walls to arrange symmetrical grouping. The difficulties and limitations have thus been carefully and somewhat ingeniously overcome with considerable advantage.

The geographical situation of the building demanded that at least two of the elevations should be regarded as of principal importance, and in order to command views of the Queen's-square with the King Edward Memorial it was important to plan the large rooms with windows overlooking this public space.

The Classic design of the Victoria Rooms suggested that a similar character and relation be introduced in this adjacent new building, but, having regard to the difference in size and the comparatively small frontage available, the architect's design is less severe and monumental, but cannot be regarded as in any way disturbing or undesirable.

The principal façades are throughout of Bath stone architecturally treated with carving and mouldings. All the floors are of fireproof construction.

In many ways and with pleasing effect emblems of the Empire have been introduced as ornaments to the column caps, cornices, and leaded glass; while the names of four important Possessions are carved on hemispheres borne by figures of Atlas surmounting panel pilasters at the principal angles.

The royal coat-of-arms occupies a prominent position in the pedimented gable over the staircase window, below which a label panel bears the inscription: "The gift of Thomas J. Lennard to his fellow-citizens." The entrances are from Whiteladies-road; one for service and back offices.

The lobby, which is lighted by a domed lantern, accommodates a small inquiry office, register desk, notice board, etc. Glazed swing doors divide this outer vestibule from the stair hall, both being paved with black and white marble.

The reception-room on the ground floor is entered from the hall, and has a floor area of nearly 800 sq. ft. with an additional end semicircular bay window fitted with leaded glass in which is introduced a very fine coloured reproduction of the City arms. A massive oak mantelpiece and overmantel surround the marble fireplace. The dado is of panelled oak and floor of hardwood parquet.

A well-appointed gentlemen's lavatory and cloak-room is approached from the hall.

The first floor accommodates a saloon 36 ft. by 22 ft. and 15 ft. high. At one end is added a semicircular bay window, and at the other a raised platform with connected retiring-room. The walls are finished with a high oak panelled dado, and the floor is parqueted. A ladies' cloak-room and lavatory is formed on this level. Upon the second floor a well-fitted library occupies the principal position and is equal in size to the saloon below. In the segmental ceiling two circular lead glazed panels afford subdued top light for reading. Approach by means of casement windows to the asphalted balcony over the bay window provides a delightful opportunity of viewing the Queen's-square from an elevated and commanding position or the enjoyment of a book in the open air.

A service kitchen with pantry is connected to the library for preparation of light refreshments.

The spacious open well grand staircase occupies a space of 18 ft. by 14 ft., and is constructed of teak with heavy carved newels and turned balusters from ground to second-floor levels. The stairs and landings are amply lighted by large windows filled with leaded glass, in which colours are only sparingly introduced; in the upper portion the lion and unicorn, rose, shamrock, and thistle, Colonial products, and the badge of the Royal Colonial Institute are introduced as enrichments. At the rear of the building a fireproof staircase is constructed from basement to the top story for general service, and therefrom are connections at each floor with the principal staircase landings. A back entrance lobby and mezzanine store are also entered from this service stairway. A small electrically-driven lift is installed for the full height of the building.

Fibrous plaster enrichments of special design are applied to the ceiling beams and panelled walls.

The whole building is warmed by means of low-pressure hot-water through radiators fixed in suitable positions, and hot water is installed for the lavatories.

Artificial light is by electricity, and ample provision has been made to ensure well-distributed lamps of the semi-indirect pattern. Special provision is made for light to the saloon to suit requirements of lecture illustrations, etc. Oak furniture and library fittings are made and supplied from the architect's drawings.

The designs were the work of Mr. Norman G. Bridgman, A.R.I.B.A., of the firm of Bridgman & Bridgman, A.R.I.B.A., M.S.A., architects, Torquay, Paignton, and Bristol.

Mr. Frank Wilkins, of Bristol, was the general contractor, and the following specialists were engaged on the building, viz., Messrs. W. J. Spry & Co., Bristol, for heating; Mr. William Smith for carving; Messrs. King & Co., Bristol, for electrical work; Messrs. G. Cox, Ltd., Leicester, for fibrous plaster work; Messrs. Swaine, Bourne, & Son, Birmingham, for stained glass. BRIDGMAN & BRIDGMAN.

Patronal Window, St. Kenelm's Chapel, Clent.

ACCORDING to the legend followed in the treatment of the window, Quendryda, the jealous sister of Kenelm, King of Mercia, endeavoured unsuccessfully to poison him; and, later, induced Askobert, his guardian, kill him.

Kenelm was warned in a dream, and in two quatrefoil traceries is depicted recount it to his nurse. The dream is illustrated the head of the sinister light. Quendryda Askobert are represented in the intermedi traceries above the dexter light conspir outside the hunting palace of Kenelmsto In the head of the dexter light Kenelm shown asleep, the while the unfaithful guard digs his grave. The next subject represe Kenelm chanting the "Te Deum Laudamu and at the words "The white-robed army martyrs" Askobert strikes off his head.

Some time after, as Pope Leo was celebrat mass, a dove appeared, dropping on altar a white scroll giving the whereabo of Kenelm's body. This forms the substa of the next subject. Below is a ship bear the Pope's embassy of monks, who were find and reinter the hidden body. In lower panel of the dexter light the monks seen discovering the spot, and in the trac above the sinister light is represented miracle of the springing water. Another pa depicts the outraged people of Worce barring the way of the men guarding the holders. The lower part of the light dep the monks refreshing themselves near abbey, and the horrible death of Quendry at the west door. The remaining two subj illustrate the two occasions upon which Kenelm is said to have appeared after death.

The subjects, which are adequately int preted by descriptive ribbons, are set u lattice or diamond panes made up of so pure and some slightly tinted whites of s body as to form a mosaic with the inte and jewel-like colour of the subject portion

The window was designed by Mr. Wal Camm, and executed by Miss Florence Messrs. Robert & Walter Camm, at The Stu Smethwick, near Birmingham. Both cartoon and design were in last year's Acade

Bath Improvement Scheme.

WE deal with this fine scheme in an art on page 199. We shall be illustrating perspective views showing the appearance the two ends of the Forum in a subsequ issue, but the six illustrations given are a small part of the series of drawings w which Mr. Atkinson has illustrated explained his scheme.

Incorporated Clerks of Works' Association Carpenters' Hall, London-wall).—6.45 p.m.

TUESDAY, MARCH 14.

Incorporated Institute of British Decorators. Mr. Arthur Wilcock, F.I.B.D., on "Colour and Patterned Draperies in Decoratio 8 p.m.

WEDNESDAY, MARCH 15.

Concrete Institute.—Paper by Mr. W. Perkins, M.C.I., entitled "Some Examples Dangerous Structures." 5.30 p.m.

Carpenters' Company.—Mr. H. J. L. Ma on "Seals." 7.45 p.m.

THURSDAY, MARCH 16.

University Extension Lecture (at the Brit Museum).—Mr. Banister Fletcher on "Ea Christian Buildings in Bethlehem." 4.30 p.

CIVIC DESIGN SECTION.

TH IMPROVEMENT SCHEME.

ATH occupies a unique position among English cities, as, though of great antiquity, dating back as it does to an times, its buildings, with the exception of nedieval Abbey Church and a few modern gruities, form a consistent epitome of the tecture of the later Georgian era.

city fell on evil times during the mediæval , and the baths, held in such high esteem e Romans, were neglected and disused. 2, it is recorded, they “were like so many gardens, and modesty was altogether shut t them: dogs and cats were thrown over ails into the waters while people were ng in them. The roads were barely ble, the houses thatched with straw, and a block and manger stood at each door.”

visit of Queen Henrietta Maria directed tion to the importance of the waters and lvantage of rendering the city suitable to commodation of the wealthy, and in 1646, ears after the brief visit of the Queen, the ration passed a series of by-laws for the vement of the city.

y years after, the increase of public ngs, churches, and conduits was notice- but they were still kept within the ancient In the time of Queen Anne Bath became sort of the nobility and the asylum of ny invalids; but its progress was checked nce and the facilities given to foreign travel, ter by the Napoleonic wars.

present position attained by Bath is due to the enterprise and skill of the two s and Baldwin, who, like Nash in Regent- , gave an expression of stateliness to s of private houses, proving that a tive and uniform treatment of private ngs may give a character to be attained other manner. The expression of mediæval ecture depended on the dominance of hurch, that of the eighteenth century on chitectural treatment of private property, in the last century we have seen the results of the uncontrolled individualism age which was not saved by the dominance e great religious inspiration which was ount in the age of the cathedral builders.

s fitting that the Corporation of Bath, ting the results of the work of the town ers of the eighteenth century, should seek as to the manner in which Bath be collectively developed in order to fit ake an undisputed place in the first rank dern European spas. It has everything in our—in a past expressed in architectural which has made it one of the most ful cities in Europe, and the scheme which strate shows how well Mr. Robert Atkin- ho has been employed by the Corporation th to advise them, has carried out his n.

believe he has made a study of almost building of architectural importance in and has looked up the records left by rchitects to whom the city owes its nce. The results of his efforts, if carried xecution, as we hope will be the case at tant date, will give the city what it needs finest municipal centre of any town in untry, without disturbing or destroying f its famous historic elements, and will away slums and dilapidated property centre of the city which at present t from the full effect of the magnificent l disposition of its plan. What we like Mr. Atkinson's scheme is that it is in ete harmony with the work of the planners h: indeed it might have been discovered old engravings in the form of a project. *otif* of the scheme is the formation of a or “Forum” south of the Abbey Church axial line with Philip-street. The sides open space so formed are formed by ump-room and Roman Baths on one nd by a block of existing property on the other, the figure being completed by an hotel and a block of baths at the sides, and the axial line at the Philip-street end being closed by a Concert Hall.

The line of North Parade is continued through the Forum and runs along the side of the Roman Baths into Stall-street. To the south of this line is a suggested new block of baths, balanced by existing buildings, which will be retained; and opposite the Pump-room block is a proposed new hotel, the main entrance to which is from Orange-grove. The whole of these buildings are linked together by a colonnade surrounding the Forum, except on the side of the Abbey Church, while the outer front of the proposed Concert Hall forms the centre of the axial line of Philip-street. The centre part of the Forum is sunk 10 ft. to within 5 ft. of the level of the Roman Baths. This height will enable any remains discovered to be left exposed *in situ*, while any lower level would involve their partial destruction.

The whole is approached by a wide flight of steps protected by balustrades, and the lower part is surrounded by a raised platform of three steps, giving access to the Roman Baths. As the Abbey Church is not symmetrically placed, some feature was necessary to mark the centre line, and a simple horizontal *motif* has been adopted as being most suitable. A bandstand worked in against the screen wall completes the open-air concert theatre, of which steps and balustrades form the background.

The lay-out of the remainder of the Forum is simpler, a circular pond and basin marking the intersection of the various foci, and concentric rings widen out gradually from it. Strong encircling lines of trees, paving, and roadways complete the scheme, which is fully shown in our illustrations.

The colonnades are in keeping with Baldwin's treatment of Bath-street, and give a continuity and completeness to the central space obtainable in no other way, while they would serve a most useful purpose in a resort for invalids.

The suggestions for new buildings are naturally of a tentative nature, but, it would seem, are on very suitable lines, which should require modification in detail only. The bathing establishment would give accommodation for 100 baths, and has been planned with a central glazed winter garden, with large lounge hall and cooling-rooms.

It is proposed to clear out the basement baths in the existing building, as they are not liked by bathers, and encumber the Roman remains which otherwise would be more interesting and easily accessible. It is intended to substitute a new system on the extended site, with accommodation for about eighty bathers.

The planning of the hotel is conjectural, but an endeavour has been made to anticipate modern wants. The chief outlook from it is over the Orange Grove and river. The front of the hotel and new Bath blocks is occupied by shops. The colonnade scheme also includes the treatment of Orange Grove and Gardens, a flight of steps leads down to the Gardens, and the obelisk marks the centre line of Pierrepont-street and forms a focal point in the approach from Station-road, also composing with the extreme edges of Orange Grove and covering the transition from the plain walls to the steps.

It is not proposed to interfere with the circular garden of the Orange Grove; but, as the obelisk has no base, it is proposed to raise it on a pedestal, as it becomes an important focal point.

We feel that the Corporation of Bath are to be congratulated on the excellence of the scheme laid down, and are fortunate in the fact that money spent in developing Bath on the lines indicated is capital which should bring in good interest in the shape of visitors, and it may be urged that the sooner the scheme is put in hand the less likelihood there will be of the city suffering from the competition of foreign spas.

RECONSTRUCTION.

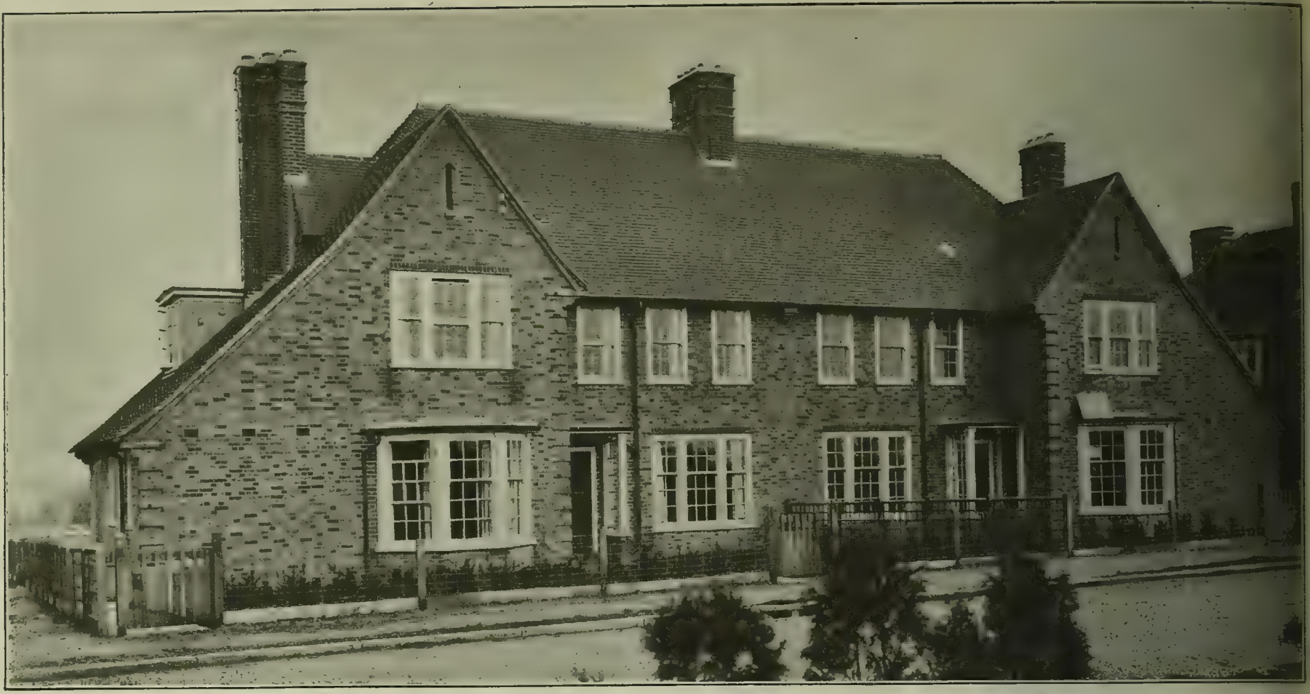
Much must be done in the way of reconstruction of institutions and industries after the war, and this is certain to involve building, for the old order will have changed, giving place to new.

The National Housing and Town Planning Association is doing a most useful work directing attention to the magnitude and importance of the housing problems which confront us, and the National Congress which the Association are promoting should prove most useful in formulating a programme the execution of which will mark a first stage in the reconstruction of the homes of the people in accordance with principles of hygiene, and will put an end to conditions which have tended to sap the vitality of the workers.

Every agency, public and private, must help if a great evil is to be swept away. It is absurd to spend public money lavishly on well-appointed schools and hospitals if conditions which are deemed essential for health in them are entirely disregarded in the homes in which most of the lives of the largest class of the population are spent.

We admire old villages as being picturesque, but an examination of the component dwellings of which they are composed will frequently make us wonder that disease and infirmities do not exact a greater toll of the population than is the case, while in the slums of our great towns similar conditions obtained without the picturesque accessories which partially obscure the squalor of the old English village. Whatever the capital cost may be, it will in the long run be found cheaper to rebuild the habitations of the workers than to provide and support an adequate number of hospitals to cope with disease which is largely due to overcrowding and other insanitary conditions.

The expansion of manufacturing production which is likely to follow the war must necessitate building both in the form of factories and in the provision of housing accommodation in their vicinity, and it is to be hoped that, though few individual firms are likely to do what has been done by Messrs. Cadbury at Bournville and Messrs. Lever at Port Sunlight, few will emulate the carelessness with which the typical nineteenth-century manufacturer desecrated the land by the creation of industrial “hells,” for no other word so adequately describes the South Staffordshire Black Country or parts of South Wales and Lancashire. The feudal tyrant may have made life miserable for his inferiors, but he did not deface the work of Nature beyond recognition, while the industrialism of the nineteenth century destroyed all that “the eye of heaven looks upon.” We may trust that electric power and improved means of transit no less than the high rates of most of the larger towns will more and more tend to the growth of manufacturing industries in the country, and that the agglomeration of larger masses of manufacturing industries in existing centres will be unnecessary. We do not view with complacency the further extension of neighbouring towns towards one another, producing continuous urban districts from which there is no easy escape. We would rather see the growth of new towns of more moderate size laid out on reasonable and convenient plans and situated in the midst of country districts. There is another reason why a further increase in the size of our greatest towns is bad economy, which is that their main arteries are already overtaxed as a result of the growth of population, which renders the rebuilding and replanning of the centre areas very desirable if not absolutely necessary, and these conditions would be intensified if the area occupied is greatly extended. We have built our towns with no provision for future requirements, and it is therefore better policy wherever it is feasible to build entirely fresh centres than to add to existing centres. In other



Nos. 7 & 8, Meadway-Close, Hampstead Garden Suburb: View from Close.

Messrs. B. H. Webb and H. S. East, Architects. (*See page* 201.)

words, we prefer the multiplication of centres like Letchworth to the octopus-like endeavour of Manchester and Liverpool to merge themselves in a continuous urban district.

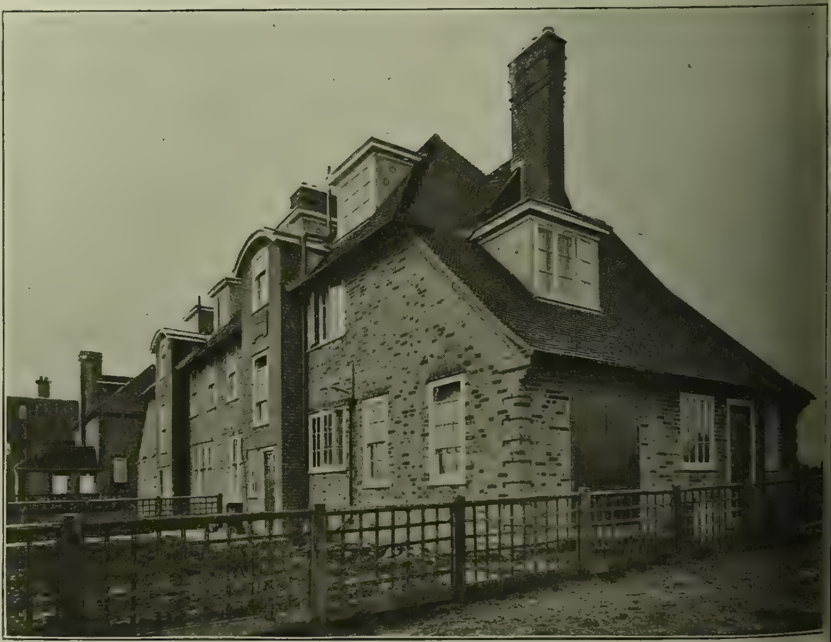
The two divisions of building activity to which we have alluded are most urgently needed both in the interest of the well-being of the people and future commercial expansion, and next to them in importance is the adoption of town-planning schemes in the heart of our existing towns to make good the defects of an unimaginatve past; but such schemes are not likely to be pressed immediately after the war, as most of them involve enormous cost, but they cannot be indefinitely deferred, for doing so will add to their ultimate capital cost, and hardly one of our large towns has been laid out with any regard to the future needs of population, while most of the railway approaches to our towns are badly conceived artistically, and often wasteful, and their rearrangement, especially in the London district, is at once badly needed and enormously costly.

Another problem of the near future will be to consider how by the wise provision of amenities our watering-places by the sea and inland can be made more attractive. The Continental exodus is for the time being ended by *force majeure*, but after the war it will be resumed to as great an extent as before unless our watering-places bring themselves into line with the requirements of the modern world, and money spent wisely on the provision of suitable buildings and the organisation of amusements will pay the localities which adopt progressive schemes, and will also tend to enrich the country by promoting the circulation of money at home instead of abroad. We are glad to learn that Bath is contemplating a scheme which should enable it to offer attractions to its visitors, and put it in a better position to compete successfully with foreign spas, and hope the example will be followed by other inland watering-places, while much leeway has to be made up if our seaside resorts are to be made as attractive as the Norman watering-places and Biarritz. The seaside lodgings, pier, and bandstand which proved sufficient attraction in the time of Leach are not so any longer, while our neighbours have studied the wants of the holiday-maker and made much profit out of doing so. Just as the authorities of the Port of London are carrying out plans which will give London a greater chance of outrivalling foreign ports in its shipping facilities, so ought those in authority in our watering-places to plan how they can attract people who before sought the Continent as a holiday-ground. We have briefly indicated directions in which the reconstruction brought about by the war may affect the building world, for in spite of dear money and heavy taxation there is reason to believe that this country will not be exhausted but invigorated by the effects of the present struggle, and may be on the eve of a more prosperous epoch than she has enjoyed for a long term of years. Though the successful prosecution of the war is our immediate task, the exploitation of the opportunities which peace will bring will be only second in importance, and the realisation of what may be gained is the first step towards attainment. Those in authority have not utilised the services of architects as fully in this period of stress as they might have done in the national interest, but when peace comes the architect's services will be a necessary element in the great schemes of reconstruction which must follow.

COTTAGE BUILDING.

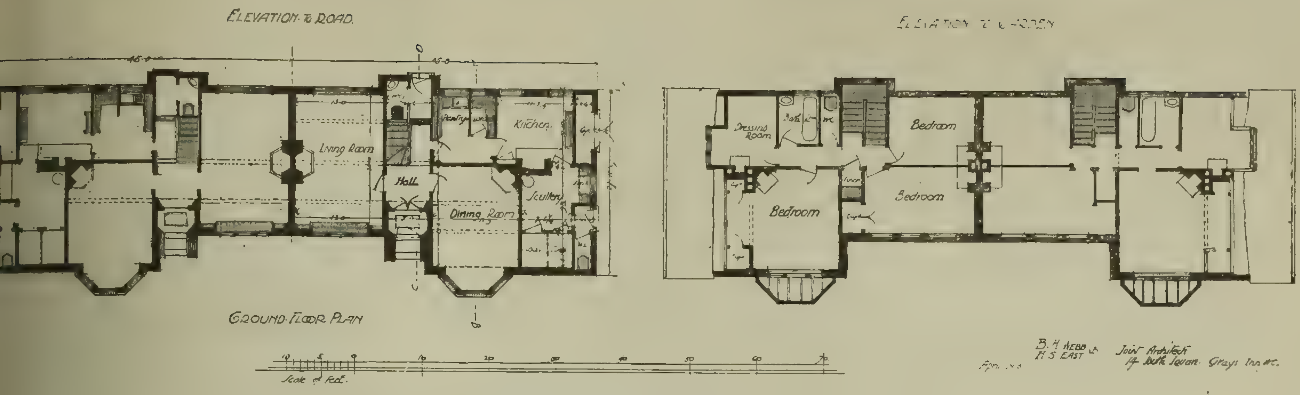
THE great necessity for more housing acc
modation in Sheffield, not only to shelter
thousands of workers who have come into
city since the outbreak of war, but to prov
for the working classes generally, is emphasi
by the details which are to be laid before
Sheffield City Council.

The Wincobank scheme for the housing
additional workers has received the furt
consideration of the Estates Emergency S
Committee, and the City Council are to
recommended to make application to the L
Government Board for their sanction to
borrowing of the sum of £69,200 for the pur
of erecting 261 houses on the High Wincob
Estate, in accordance with the scheme appro
by the Government authorities. The applica
is to be made subject to and in accordance
the conditions on next page.



Nos. 7 & 8, Meadway-Close, Hampstead Garden Suburb: Garden Front.

Messrs. B. H. Webb and H. S. East, Architects. (*See page* 201.)



Nos. 7 & 8, Meadway-Close, Hampstead Garden Suburb.

Messrs. B. H. Webb and H. S. East, Architects.

The department concerned has agreed to ibute 20 per cent. of the total cost of the sed buildings, including the cost of streets ewers, such total cost being estimated at 00—namely, £75,000 for buildings and 00 for streets and sewers.

It is agreed that the cost of the scheme, he Government's contribution of 20 per as aforesaid, will be advanced by the rnment to the Corporation as and when ents in respect thereof shall fall due, and the amounts so advanced will be repaid e Corporation with interest at the rate of cent. per annum on the annuity principle, a period of sixty years in respect of the ngs and twenty-two years in respect of s and sewers.

The houses shall during the period of the e available for munition workers employed national factories in Sheffield or at other engaged in the manufacture of steelwork, uch workers shall during the same period prior claim to occupy the houses as tenants odgers.

The houses shall be completed fit for ation as to 120 in three months after ry 17 last, as to eighty additional in four half months from the same date, and as balance of sixty-one by July 31, 1916. ded that if any delay occurs which is ed by the City Architect to be due to outside the control of the Corporation, ontribution of 20 per cent. as aforesaid e authorities shall not be reduced or eld on account of such delay.

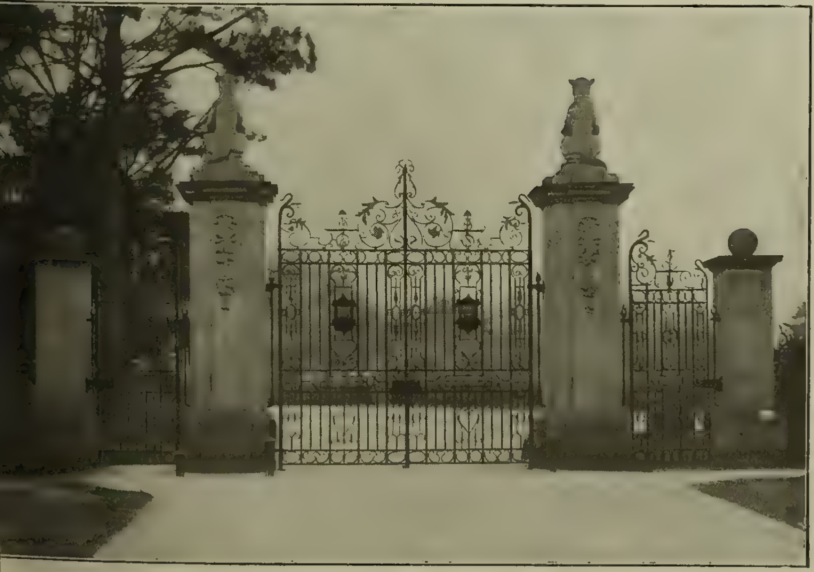
interesting Report issued by a Special ittee appointed to consider the building s of the city will also be placed before the il. The Sheffield Society of Architects Surveyors, and the Master Builders' ation, and the Corporation officials have reports to the Committee on the matter, with the result that the Council are to be asked to agree to by-laws being altered for the period of the war and for two years afterwards, in view of the high price of building materials and the increased cost of labour, and with the object of encouraging the building of cottage property in the city.

The Committee point out that they are advised that economies in the building of cottage property can be made by omitting cellars and substituting pantries and coal-houses on or near the ground-floor level; by the use of reinforced concrete walls in accordance with by-laws; by advantage being taken of by-law relating to the height of rooms, which permits rooms on the first floor to be 7 ft. 6 in. at the eaves; and by the use of asbestos tiles for roof covering instead of slates in accordance with by-laws.

It is further recommended that the Water Committee be requested to reconsider their regulations requiring a ½-in. separate lead water service to be provided in the case of each house having a bath, as the Committee are advised that this service pipe is sufficient for more than one house. The Committee have under their consideration other questions relating to this subject upon which they hope to be in a position to report to the Council at its meeting in April.

WROUGHT-IRON GATES.

We illustrate a fine example of wrought-iron work in the form of some entrance gates which were designed by the late Richard Creed, architect, and which will, we think, be of interest to our readers. Mr. Creed made the ½-in. design, the full-size details were worked out by Mr. J. A. Newington, and Mr. Finch, of Baglan, Briton Ferry, Glamorganshire, carried out the work.



Wrought-Iron Gates made for the Right Hon. Lord Belper.

NOS. 7 AND 8 MEADWAY-CLOSE, HAMPSTEAD GARDEN SUBURB.

THESE houses were built two years ago from the designs of Messrs. B. H Webb and H. S. East on a site facing east and west, and so arranged that the main sitting-room has a view each way.

The walls were faced with parti-coloured red bricks and the roofs covered with sand-faced tiles. Both houses are heated throughout with hot water supplied from an independent boiler which also supplies all the hot water used for domestic purposes.

The accommodation provides two sitting-rooms and five bedrooms and dressing-rooms, inclusive of two large rooms in the roof.

The builders were Messrs. Mattock & Parsons.

CIVIC REVIEW NOTE.

The Garden Cities and Town Planning Association.

THE question of the settlement of discharged sailors and soldiers upon the land, which is recommended by the recent Departmental Committee's Report, will be dealt with at the annual meeting of the Garden Cities and Town Planning Association, which will be held at the Mansion House on Wednesday afternoon, March 22. The Lord Mayor will preside, and among those taking part will be the Marquis of Salisbury, the President of the Association, and the Earl of Selborne, the President of the Board of Agriculture, who will deal with the proposals in the Report. The formation of garden villages, with the idea of a more general distribution of the population upon the soil, has been one of the chief aims of the Association since its foundation, and at the outbreak of war a Special Committee was at work with the idea of establishing a small holdings colony.

LAW REPORT.

KING'S BENCH DIVISION: COMMERCIAL COURT.
(On February 25.)
(Before Mr. Justice SCRUTTON.)

Action against and Counterclaim by Builders: Indented Bar and Concrete Engineering Company, Ltd. v. J. Chessum & Sons.

HIS LORDSHIP had before him a counterclaim by Messrs. J. Chessum & Sons in an action brought against them by the Indented Bar and Concrete Engineering Company, Ltd., of Stoke-upon-Trent.

Judgment had been signed on the plaintiffs' claim for balance of account for quantities of indented steel bars supplied in connection with extensive buildings the defendants were erecting at the Royal Albert Docks, and the only matter for his Lordship's consideration was a heavy counterclaim by the defendants, running (said counsel) into some thousands of pounds, for alleged delay in delivery, in consequence of which, they said, they had suffered damage.

Mr. Roche, K.C., was opening the case for the defendants in some detail, when a consultation took place, and terms were arranged disposing of the matter.

The nature of the settlement was not disclosed.

THE BUILDING TRADE.

WHAT IS A NEW BUILDING?

NOW that the case Rex *v.* Foot's Cray Urban Council, to which we have already referred, is fully reported in the Law Reports (1916, 1 K. B. 246), a few more observations on this important decision seem called for. It will be remembered that a firm of brewers, being desirous of adding to a very old building, a public house, had pulled down a portion of the old building, but had left a larger part of the old building standing; thus the operation was partly an extension, partly a re-erection, on the old site, and the leaving standing of a larger portion of the old building. The brewers gave the Urban District Council notice and plans of the portions of the building which were new, or to be altered, but not of the building as a whole, including the old portion; but the Council summoned them for not having given notice and plans as to the building as a whole. The Council had a by-law that "Every person who shall intend to erect a building shall give the Council notice of such intention, and shall at the same time deliver complete plans and sections of every floor of such intended building."

The Public Health Acts Amendment Act, 1907, was in force in the district, and sect. 23 of that Act provides that "For the purposes of this Act and the Public Health Acts, and any by-laws made thereunder, each of the following operations shall be deemed to be the erection of a new building:—

(*a*) The re-erection, wholly or partially, of any building of which an outer wall is pulled down or burnt down to or within 10 ft. of the surface of the ground adjoining the lowest story of the building.

(*d*) The making of any addition to an existing building by raising any part of the roof, by altering a wall, or making any projection from the building, but so far as the addition only."

A Divisional Court, overruling the magistrates, held that the building as a whole was a new building, and remitted the case to the Justices to convict.

After conviction, fresh plans were submitted, similar as regards the portions of the building being re-erected, but showing the old portion of the building left standing with all the floors. The original plans had only shown the ground floor of this part of the building.

These plans were again disapproved by the Council, and the brewers were served with a notice that the Council intended taking proceedings to recover penalties, on the ground that the brewers had brought forward part of the front of the building beyond the walls on either side of it. This referred to the old existing building.

The brewers then applied for a mandamus to compel the Council to consider and approve the plans. This came before a Divisional Court, but differently constituted to that which had adjudicated on the first case. This court, however, found itself bound by the decision of the court of concurrent jurisdiction in the first case (Leonard *v.* Hoare & Co., 1914, 1 K. B. 798), but one of the judges at least expressed some doubt on the question. In these circumstances the case was carried to the Court of Appeal, and that court, not being bound by the decisions of courts of inferior authority, overruled the decisions. This being a brief history of the litigation, it may be useful to analyse the reasoning of the Court of Appeal on this very important question.

Under the Public Health Act, 1875, sect. 159, it has been held to be a question of fact in each case whether additions and alterations are so extensive as to render the whole structure a new building. See James *v.* Wyvill ([1884] 51 L. T. 237).

Under the London Building Act, 1894, in sect. 5, sub-sect. 6, an exact proportion is named, and, if more than this is taken from an old building, then it is to be deemed a new building.

Neither of these Acts applied to the case under consideration, which was governed alone by the Public Health Acts Amendment Act of 1907, the necessary provisions of which we have set out above, and the Court of Appeal have interpreted sect. 23 so far as it applies to the facts of this case as making a new building, not the whole building, but only such portions as are "wholly or partially re-erected."

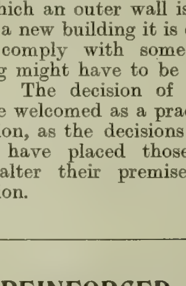
Lord Justice Bankes explained that this statute was passed to meet a plain want and nothing more; it was passed to deal with a re-erection, which, under the statute of 1875, was not sufficient to be a new building, but yet was sufficient of itself to come under the control of the local authority and within their by-laws.

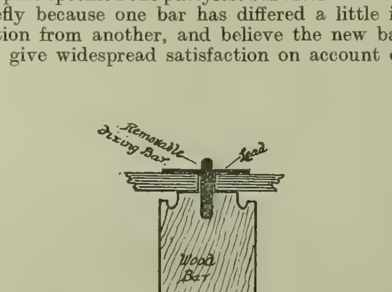
This, surely, is the most practical and satisfactory interpretation of this section, for, as Lord Justice Swinfen Eady pointed out, when the numerous matters contained in modern by-laws are considered, the contrary view would involve pulling down the whole of an old building if one outer wall required reinstating. We may point out that the real issue in this case was whether the notice and the plans deposited were sufficient, a point that the Court of Appeal has now decided in the affirmative. The notice of an offence in bringing forward the building seems to have been merely of a formal character; but it lends point to the observation we have made above, as were every building of which an outer wall is pulled down to be deemed a new building it is quite conceivable that to comply with some by-laws the whole building might have to be set back to a building line. The decision of the Court of Appeal will be welcomed as a practical solution of this question, as the decisions of the lower courts must have placed those desiring to improve or alter their premises in a very difficult position.

A NEW REINFORCED GLAZING BAR.

The Interoven Stove Company, Ltd., of 156, Charing Cross-road, have patented a new reinforced glazing bar. The company are going to carry on this business separately from their stove work, under the title of the Metacon Glazing Bar Company, but from the same address.

The promoters state that architects have in the past specified one puttyless bar after another, chiefly because one bar has differed a little in section from another, and believe the new bar will give widespread satisfaction on account of its anti-corrosive properties. The advan claimed for it are that no painting is neces no putty used in fixing, and no bolts are req to hold the lead flashings in position. is no difficulty in replacing broken glass, as are no nuts or bolts to rust. The bars ca cast in any length or form, while the bar which holds the lead flashing in po is readily removed, and allows of the ins of new lead after years of use. The com will be glad to furnish samples of the particulars of different sections, and pric





The section which we illustrate show great simplicity of the new patent, should meet a widely-felt want. Simp in glazing is everything, as those who had experience with large glass roofs frequ know to their cost. It will be noted although in our illustration the reinforce is applied in the form of T-shaped bars, any convenient section can be as readily The most admirable device in connection w is the ingenuity of the removable fixing and the way it is adjusted in connection the lead flashing, which constitutes the gre novelty, is the best feature of the new pa and one which should secure for it wides popularity and sale. There is no expa and contraction to be provided against, when desired the company can pr purlins, hips, and ridges of the same mater

PROPOSED NEW BUILDI AND OTHER WORKS.*

In these lists care is taken to ensur accuracy of the information given, but it occasionally happen that, owing to bui owners taking the responsibility of comme work before plans are finally approved b local authorities, "proposed" works, a time of publication, have been actually menced. Abbreviations:—T.C. for Council; U.D.C. for Urban District Cou R.D.C. for Rural District Council; E.C Education Committee; L.G.B. for Government Board; B.G. for Boar Guardians; L.C.C. for London County Cou B.C. for Borough Council; and P.C. for P Council.

Australia.—The New South Wales Loan mates, 1915-16, for expenditure on public etc., recommended by the Governor of the for the consideration of the Legislative Ass on December 9 last, contain the following —Harbour works and river improven £821,300; railway line additions, stations buildngs, etc., £407,000; tramway constr and additions to workshops, buildings, house, etc., £265,000; water supply £810,000; public buildings, £135,000; abattoir, meat market, etc., £200,000.

Batley.—The T.C. has had before them for an extensive new mill and warehouse Messrs. John Fenton & Sons intend to er Batley Carr.

Belfast.—The City Surveyor has instructed to carry out certain temporary at Greencastle in order to relieve the fl caused by the overflow from a strea Whitewell-road.

Burnham (Essex).—At a recent meeting U.D.C. plans were submitted for a house built at the corner of Maldon-road for Poulson.

Chelmsford.—The Sanitary Committee T.C. has recommended that the Survey directed to prepare plans, specification estimate for the erection of a dust dest and a report upon suitable sites for a destr

Doncaster.—The T.C. has agreed to con a road on land adjoining the Grand Stand at an estimated cost of £1,600, at the req the Road Board.

Dundee.—Messrs. Fleming & Barry, Camperdown Sawmills, having given u ground they occupy at the harbour, an Caledon Shipbuilding Company, Ltd., applied for this ground for an extension o yard.

Durham.—Plans passed by the R.D.C.

ny, naphtha tank and shed, Foss Islands-
Messrs. W. Birch & Sons, Ltd., five
Heworth-road; Mr. G. L. Brown, altera-
143, East-parade.

dmynach.—At a recent meeting of the
illy Council attention was drawn to the
ility of town planning at Ystradmynach.
decided at a forthcoming joint conference
he Gelligaer members whether they would
ate in the suggested scheme for adopting
wn Planning Act.

GENERAL BUILDING NEWS.

ST. JUDE'S CHURCH, MAPPERLEY.

The Bishop of Southwell recently consecrated two new aisles in connection with St. Jude's Church, Mapperley. Hitherto the building has only consisted of chancel and nave. Previous to the alterations, the nave was a building 60 ft. by 24 ft., and originally designed with the idea of extension by means of transepts. Eventually the building is to be extended 16 ft. westwards, with another bay to the arcade. The old roof has been relaid with new tiles, and a good deal of alteration has been done to the original part of the building in connection with roof and heating. The seating accommodation has been increased from under 200 to 400, at a cost of about £3,000. The architects are Messrs. Heazell & Sons; and the work has been carried out by Messrs. Thomas Long & Sons.

CHURCH HALL, EDINBURGH.

A new church hall and vestry for St. John's Church, Princes-street, were recently dedicated by the Bishop of Edinburgh. The building, which is situated on the south side of the church, has been erected over the cloistered vaults. It has been designed by Mr. J. M. Dick-Peddie, and has cost over £2,300. It consists of a clergy-vestry, porch, and a hall, which will accommodate 300 people.

PREMISES, GOLDEN-SQUARE, PICCADILLY.

The superstructure of No. 22, Golden-square, Piccadilly, W., is being executed by Messrs. E. A. Roome & Co., of Crown Works, Urswick-road, Hackney, N.E., under the supervision of Messrs. Naylor & Sale, architects, Market-place, Derby.

TRADE NEWS.

In order to ensure the rough-casting and flat roofs of the kennels of the Royal (Dick) Veterinary College, Summerhall, Edinburgh, being made permanently watertight, we are informed that the powder Pudlo has been employed.

The offices of the Belfast Ropework Company, Ltd., Belfast, are being warmed by Messrs. E. H. Shorland & Brother, Ltd., of Failsworth, Manchester.

Messrs. Summerscales, Ltd., of 4, Central-buildings, Westminster, S.W., recently gave a special demonstration of cookery by Mr. William Lawton's Patent Gas Cooking Stove. The stove, which is being put on the market by Messrs. Summerscales, Ltd., under the registered trade mark "Barrister," is open and exposed to view, the principle of the closed oven being banished, and it may also be taken to pieces with ease for cleansing purposes when necessary. It is a structure of steel bars, with a horizontal burner so designed as to prevent the annoyance of "firing back," a special radiating screen providing a means of open-fire roasting. The "Barrister" stove is contrived so as to enable a cook to roast, bake, fry, grill, and boil simultaneously with a gas consumption of 15 cubic ft. per hour. It is suitable for small flats and families living in rooms, no floor space being required, as it is operated on the table, a flexible tube connecting it to any gas-fittings, and it may be taken to pieces in one minute after use. The stove is well adapted for use with fireproof ware, it being recommended for the old-fashioned English ware, and having been designed with a view to prevent the breakages which occur with fireproof pots used in connection with the ordinary gas stove. The stove will be retailed at 25s.

Under the direction of Mr. T. B. Whinney, F.R.I.B.A., Old Jewry, E.C., the "Boyle" System of Ventilation (Natural), embracing Boyle's Latest Patent "Air-Pump" Ventilator and Air Inlets, has been adopted for the cheque-sorting-room at the London City and Midland Bank, Finch-lane, E.C.

Messrs. Stevens & Adams, flooring and paving contractors, of Wandsworth, are now completing 6,500 yds. of maple wood block flooring at the new Postal Stores, Studd-street, Islington, and have a similar contract in hand at the new offices for Superintending Engineer, Denman-street, London Bridge, both contracts being carried out for H.M. Office of Works.

NEW COMPANIES.

The undermentioned particulars of new companies recently registered are taken from the Daily Register compiled by Messrs. Jordan & Sons, Ltd., Company Registration Agents, Chancery-lane, W.C.:—

J. F. Farwig & Co., Ltd. (142,976). Registered February 10. To carry on business of manufacturers of articles composed of or workers in iron, steel, tin, brass, and other metals or wood, or other substances, smiths, mechanical engineers, carpenters, cabinet makers, builders, etc. Nominal capital, £25,000 in 25,000 £1 shares.

To acquire, take over, and carry on business now carried on as packing case makers, saw mill proprietors, timber and general merchants, joinery manufacturers, contractors, dealers in machinery, brick makers, etc. Nominal capital, £5,000 in 5,000 £1 shares.

A. C. Smerdon (1916), Ltd. (143,092), 265a, Finchley-road, N.W. Registered February 23. To acquire, take over, and carry on business of coal merchants and factors, now carried on by J. H. Gill at above address as A. C. Smerdon, dealers in stone, sand, lime, bricks, timber, hardware, and general builders' merchants, mechanical and general engineers, etc. Nominal capital, £1,000 in 1,000 £1 shares.

Whitaker & Clegg, Ltd. (143,101), 76, Manchester-road, Burnley, Lancs. Registered February 23. To acquire, take over, and carry on business of slaters, concreters, asphalters, now carried on at above address, builders, contractors, stone and shale merchants, builders' merchants, quarry masters and owners, joiners, etc. Nominal capital, £5,000 in 5,000 £1 shares.

THE LONDON COUNTY COUNCIL.

The fortnightly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. Cyril Jackson, Chairman, presiding.

The first business of the Council was to elect officers for the ensuing year, and Mr. Alfred F. Buxton was elected as Chairman, Mr. W. J. Squires as Vice-Chairman, and Mr. H. H. Gordon as Deputy-Chairman.

Tenders.—Tenders were received for the supply of building materials, oils, etc.; Portland cement for the Tramways Department; river ballast for the Tramways Department; river sand for the Tramways Department; shingle for the Tramways Department.

Loans.—Loans were granted to Metropolitan Borough Councils as follows:—£3,000 and £2,000, respectively, to the Hackney and Poplar Borough Councils for electricity purposes; £1,980 to the Lewisham Borough Council for contribution towards cost of street improvements; and £4,584 to the Stepney Borough Council for repayment of loan for housing purposes.

Appointment of Representative of the Council.—On the recommendation of the Education Committee it was agreed that the Right Hon. Lord Monk Bretton, C.B., D.L., be nominated for appointment as a representative of the Council on the Committee of University College for the twelve months ending February 28, 1917.

Blackwall and Rotherhithe Tunnels—By-laws.—It was reported by the Highways Committee that the amended by-laws relating to Blackwall and Rotherhithe tunnels, made by the Council on November 23, 1915, and December 7, 1915, have been confirmed by the Secretary of State for the Home Department and are now in force.

Council Rate.—The Chairman of the Finance Committee announced that, so far as could at present be judged, and subject to further consideration, the Council rate required for the year to end March 31, 1917, would be:—For education purposes, 1s. 9d. in the £, representing a reduction of 2¼d. in the £ on the rate levied for 1915-16, and for purposes other than education, 1s. 5d. in the £ for parishes outside the City of London, and 1s. 2¾d. for parishes inside the City, the rate of 1s. 5d. representing a reduction of ¾d. in the £.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the present rates of wages in the Building Trade in the principal towns of England and Wales. It must be understood that, while every endeavour is made to ensure accuracy, we cannot be responsible for errors that *may* occur:—

——	Masons.	Bricklayers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Masons' Labourers.	Bricklayers' Labourers.	Plasterers' Labourers.

* War bonus of 2s. per week granted. † War bonus of 3s. per week granted.

WAGES IN THE BUILDIN TRADE.

Ashton-under-Lyne and Stalybrid At the recent annual meeting of the Nort Centre Board of Conciliation for the Bui Trades an appeal was heard from the join this district. Mr. R. K. Higginbotham behalf of the operative joiners, stated their application for 2d. per hour advan wages had been put forward in consequ of the increased cost of living. He pointe that their district was surrounded by Stock Manchester, and Oldham, where the were higher than those obtaining in As Mr. J. Saxon, on behalf of the emplo stated that they were fully aware of th creased cost of living, and for this reaso sympathetic towards the men, and, alth their notice did not expire until May 1, they had offered them ½d. advance as and February 1, 1916. He also stated that had settled with the operative bricklayers stonemasons for a similar amount, and it a source of disappointment to their Associ that the joiners had not accepted the Mr. C. Marshall supported Mr. Saxon, stated that several employers in the di were executing pre-war contracts upon they had no provision for such advance, a them any increase would be a great hard After considering the evidence the decided:—"That the wages of the oper joiners of Ashton-under-Lyne, Stalyb and District be advanced ½d. per hour (1 10½d.) as and from May 1, 1916, and a fu advance of ¼d. per hour (10½d. to 10¾ and from November 1, 1916."

Basingstoke.—An appeal from the masons of this district was heard at the annual meeting of the South-Eastern Board of Conciliation for the Building T Mr. S. Stranks opened the case for the tives, and said negotiations had been in pr for a set of local rules, and the parties agreed except as to the rate of wages and whether a worked-stone rule for the di should be adopted. They desired that should read:—"That no worked sto allowed to be imported from any lowe district." They also wished that Rule 1 s provide for a rate of wages for maso 9½d. per hour, with an extra ½d. for The present rate was 8½d. per hour, and asked for the advance on the ground increased cost of living, and the fact th plumbers and plasterers were already rec 9d. per hour. Mr. Musselwhite replied f employers, and said the rate for bricklaye carpenters was 8½d., and they were to grant the same to the masons, but ob to the worked-stone rule. He agreed th points of difference were Rules 1 and 8. witnesses having retired, the Board cons the case, and after some discussion the foll resolution was unanimously agreed t became the decision of the Board:— the rate of wages for Basingstoke maso 9d. per hour as from March 1, provided th proposed rule as to worked-stone be drawn."

Coventry.—The following increases in will be paid in this district as from April Carpenters and joiners, bricklayers plumbers, ¾d. per hour (10¼d. to 11d.); pa ¾d. per hour (9¼d. to 10d.); masons' and layers' labourers, 1¼d. per hour (7¼d. to plasterers' labourers, 1¼d per hour (7¾d. t

Dudley.—On and after April 1 an ac in wages of 1¼d. per hour (8¾d. to 10d.) paid to the bricklayers and carpente joiners in this district.

Leicester.—The following increases in will be paid in this district as from Apri Stonemasons, ¼d. per hour (10¼d. to 1 bricklayers, ½d. per hour (10d. to 1 masons' and bricklayers' labourers, ½ hour (7½d. to 8d.); plasterers' labourers. hour (8d. to 8½d.).

Nottingham.—On and after April following advances in wages will be this district:—Stonemasons, bricklayer carpenters and joiners, ½d. per hour (1 11d.); masons' and bricklayers' labour per hour (8d. to 8½d.); plasterers' labour per hour (8½d. to 9d.).

THE BUILDER

A RECORD OF ARCHITECTURE AND CONSTRUCTION.

VOL. CX.—No. 3815. MARCH 17, 1916.

OFFICIAL ARCHITECTURE IN INDIA.

THE architectural work undertaken by the Government of India is both important and interesting—firstly, because the Government of India is a benevolent despotism which directly undertakes and controls many branches of ivity left in this country to self-governing communities; ondly, because the needs of a population five times as merous as that of the United Kingdom have to be met; and, tly, because the nature of the problem makes its adequate ution exceedingly difficult. We have before us a copy of e annual Report on Architectural Works in India for the year 14-15, compiled by the Consulting Architect to the vernment of India, and its study adds further point to ticisms which we made in reviewing last year's Report* omments which were subsequently discussed in a letter eived from Mr. Begg which we gave in our columns.†

Our argument was that the architects employed by the vernment of India were too few in number to be able to deal an adequate manner with the enormous amount of work which ssed through their hands, and we urged that in the interests the public service and of architecture the conditions should be ered. Mr. Begg stated in his letter that “ no Government hitect in India is or can be the architect of any building in e full and individual sense that applies in private practice at me. His work is necessarily more or less of the nature of ollaboration with the administrative and executive machinery the Public Works Department as that exists from time to ne. . . . It is therefore an unsound basis on which to nd any criticism of the building work of the Department to mpare the amount of work with which one of our architects ay be associated to the amount with which the average chitect in private practice may be associated.” The writer nt on to say that the system was in a state of transition, d that the *Builder* would “ best serve the cause of architecture India by the attitude of encouragement displayed by certain its contemporaries towards the work of the Public Works epartment and, for the rest, by a suspension of judgment.”

We feel, on the other hand, that if, as Mr. Begg says, the stem is in a state of transition, presumably from a time in hich work was wholly directed, controlled, and designed by gineers to one in which work will be wholly directed, ntrolled, and designed by architects, we serve a useful purpose we are able to show reason why the transition period should abbreviated, and, admitting the argument that the work of chitects in the Public Works Department cannot be compared th that of the private practitioner, as it is more or less in the ture of a collaboration, the point still remains that the work hich has to be done by the twenty-seven architects whose mes are given in this Report is altogether too much be adequately dealt with by them, even if they are relieved of supervision and other administrative duties, which, we ther, is not entirely the case. The year's record of the work the Consulting Architect to the Government of India forms list of sixty-four buildings, including a Woman's Medical llege at Delhi, five post-offices, twenty churches, three railway-ations, seven science or college buildings, and a number of her works. The work dealt with by the Consulting Architect the Government of Bombay includes sixty-four buildings, any of great importance; that of the Government of Bengal clude fifty-two buildings; Madras, thirty-five buildings; urma, fifteen buildings of different sizes; the United Provinces Agra and Oudh, twenty-three buildings; Bihar and Orissa, any important buildings, besides work carried out in the ntral Provinces.

We are aware that these lists contain preliminary sketches for works which will be more fully considered subsequently and works which are being completed and really belong to former years; but, even assuming this and admitting that the architects employed have the assistance of engineers and draughtsmen and clerks of the works, it seems clear that the architects whose names are given in the Report are too few in number to cope with the mass of work described, and that this fact *is bound to militate against the quality of the work done, and that it would be in the interests of the Government of India to employ further architectural assistance.*

We illustrate four of the more important buildings completed in the year—two post-office buildings, the Prince of Wales Museum, Bombay, and the Government House at Puri. These are designed by four different architects, and give a good idea of the quality of work produced. Under the conditions which obtain the Government of India is to be congratulated because the standard of design is as good as it is, but we are sure that better results would be obtained from the recognition of the fact that good architecture is the result of thought and study, and cannot be produced unless the designer has ample time and opportunity for thought. The want of adequate consideration may be evidenced in defective planning, which means economical loss to the employer, and in poor architectural design, which entails a loss of beauty to the world.

In all these designs we see a curious note of hesitancy—they are neither Eastern nor Western in type—and in three out of the four definite and strongly-marked cornices and horizontal lines are, for some reason, entirely omitted. There is a more decided note in design in the examples of modern work carried out by the Indian master builders, which we give by way of comparison, and which with all their faults possess an interest which does not attach to the work of the Public Works Department. Mr. Havell* says, “ A department which exists *pro bono publico* should not be worked as it has been to the detriment of Indian craftsmanship; neither is it policy to allow the vested interests of a great State monopoly to prejudice Indians against the British Raj. Certainly there are useful things which the Indian builders might learn from co-operation with the Western engineer and architect. But why is it that in over fifty years, during which all the most important building operations in British India and in many of the Native States have been a close Government monopoly, not a single Indian master builder has been trained to understand these useful modern things? History proves that the Indian craftsman has always had the capacity for learning and even for teaching his teachers. But there is now no co-operation between the architect and the craftsman, and the education in architecture afforded to Indian students at Anglo-Indian Engineering Colleges is a relic of Victorian pedagogics of seventy years ago. . . . The curriculum is such that, if by any chance a young Indian master builder should enter one of these colleges, he would end by ceasing to be a first-rate craftsman architect and become a fourth-rate engineer.” We believe Mr. Havell is justified when he pleads for the co-operation of the English architect and the Indian craftsman, but that he is wrong in considering the working basis to be the native style. Equally we feel that the work of the Public Works Department is somewhat nondescript and indeterminate. The best medium would seem to be a vigorous and free rendering of the types of Renaissance employed with such success in the Spanish colonies of South America, Mexico, and California, varieties of which would be suitable for the wants of the climate of India, while they are European enough to be sympathetically expressed by our architects and elastic enough to lend themselves to the incorporation of much of the decoration and possibly the constructive features which are indigenous to the Indian peninsula. In the projected buildings of New Delhi, as far as we can judge from the sketch designs we have seen, there is the seed of such forms of design, which we trust will burgeon and grow, forming the foundation of a style which may be a fitting chapter in the development of Indian architecture, in the same way that Moghul forms were of the civilisation introduced by the Mohammedan rulers of past centuries.

---

* “ Architectural Work in India,” February 5, 1915.

† “ Government Architecture, India,” March 26, 1915

* “ Indian Architecture.” E. B. Havell.

If the point of view we have advanced is reasonable, it is an additional reason why the Government of India should ungrudgingly recognise the services which have been performed for them by the architects they have employed within recer years, and give them conditions which will enable them t think out the great problems, æsthetic as well as practical, whic await solution. They have moved in the right direction i recognising that architects rather than engineers should desig buildings, and they will be advancing the great work government in India by making an æsthetic improvemer possible. The benefits of British rule in India need not l confined to the administration of justice and the promotion material prosperity, but will be of more value if they mak an appeal to the idealistic and æsthetic elements of India character.

NOTES.

The R.I.B.A. and its Elections.

WE are glad to state that at the special general meeting held on Monday it was unanimously decided that the by-laws should be suspended to allow the present Council to remain in office for a further year, thus obviating the necessity for the expense and labour entailed by an election at a time when a large number of members are away. Nothing of moment can be done until the war is over, and no election result would be really representative of the views of the whole of the members, apart from which much paper—white, blue, yellow, pink, and green—will be saved at a time when there is a shortage of paper and dyes! More than this, the staff of the R.I.B.A. will be relieved of unnecessary work when their activities are fully taken up with extra work incidental to the war and the special conditions it has brought about among architects. We trust in another year's time there will be nothing to prevent the holding of an election under normal circumstances, and one which will be more interesting than usual, for many live issues will come into being with the termination of hostilities, and it is to be hoped that commercial prosperity will follow in its train.

Westminster Cathedral.

THE mosaic tympanum over the main entrance of Westminster Cathedral has been completed, and the effect of Mr. Anning Bell's work can be seen. The central group represents God the Son, attended by the Virgin Mother and St. Joseph. Christ is seated on a throne, one hand raised in blessing the world, and is crowned by the cruciform nimbus. On the extreme left of the panel St. Peter is shown as the first Bishop of the Christian Church. On the extreme right of the panel is St. Edward the Confessor. The treatment of the figures is reticent and refined, and the colouring very pleasing when considered independently of its surroundings; but when these are taken into consideration we feel that the whole effect is too light in tone, which will be increasingly apparent as the surrounding stone and brickwork become darker. We question whether the external use of mosaic will ever be wholly satisfactory in our climate, and, although the tympanum was intended for mosaic decoration, we believe a far better result would have been possible had stone bas-reliefs in low relief been employed. This need not detract from our appreciation of a piece of work which is in itself fine and well considered; but the decoration of Westminster Cathedral will enable us to form an opinion as to whether marble or mosaic is suitable for the decorative schemes of any of our buildings.

Mr. Pennell's Criticism.

ONE of the most difficult questions to decide is whether our views on art and architecture are almost wholly the result of education and habit or whether they are founded on instinctive and racial feelings which it is unwise to attempt to override. The gist of Mr. Pennell's criticism as shown in his letter to us—and, we may add, in the notes in the catalogue of "Germany at Work"—indicates a dislike of Classicism as expressed in modern architecture and a suspicion of concealed construction. Mr. Pennell sees the soul of structure in things mediæval, in modern engineering, and in the work of Germany, and elsewhere we are inclined to believe he suspects an inclination to indulge in unmeaning shams. He probably expresses in his views on architecture what many of the public feel but give no utterance to. It may be that the modern architect is dangerously "off the rails" in his estimation of architectural values, and that the public want of interest in the subject is due to an instinctive dislike of an artificial standard rather than a normal indifference to a subject they do not understand. The question is one of very great interest, and we should like to hear more of Mr. Pennell's views than can be covered in the notes in a catalogue, however tersely and vigorously expressed. History shows how difficult it is for any generation to separate the prophet from the fanatic, and time is almost always necessary before we can judge fairly as to the rival claims of the discoverers of "truth."

The Land Taxes and Economy.

THE *Times* on March 2 called attention to tl extravagance involved in war-time by continuir the Land Valuation Department, which it asserte would cost £361,000 in the coming year to secu the collection of revenue which would not amou to £50,000. The actual expenditure of the Department is not tl only waste involved by this system of taxation, as it still impos expense on those who come under its long-drawn-out valuations, ar it still is detrimental in checking building and other industric The scheme of valuation was always chimerical, and if it had ev had any bottom in it the war has certainly knocked that botto out. What possible use can it be to ascertain the value of propert as on April 30, 1909? It would serve as useful a purpose to ascertai its value before the Flood. The war has put an end to "incremer value" for many years to come, and present conditions render it manifest injustice to tax undeveloped land. Undeveloped soldie are all that the nation are now considering. We cannot help feelir that the author of this system of taxation, who is now doing suc splendid service to the country, might be relieved himself if one his own bombs were to shatter this whole scheme of land valuatior but, however this may be, when the Government are looking f economies to be effected and men to be set free they cannot do bett than to evacuate the Land Valuation offices and order the sta "back to the land."

Churches of St. Nicholas and St. Peter, Liverpool.

AN Order in Council has just been made to constitu the old parochial Chapel of St Nicholas, whic stands by the riverside, near to St. George's landin stage, as the parish church of Liverpool instead St. Peter's, formerly the cathedral, as the Chap of the Virgin in the new cathedral is now opened ar dedicated for worship. The Order provides further for the pullir down of St. Peter's and vesting the site and churchyard in tl Ecclesiastical Commissioners. The church was built in 1704, ar is a good specimen of an ordinary tower church of that day, havir an interior with good woodwork and fittings of oak, and a tow surmounted with an octagonal turret and pinnacles. St. Nicholas' which at one time had four chantries, was erected in or about 135 and for more than 350 years was the only church in the origin chapelry of Liverpool in Walton parish. It was rebuilt (the tow and spire excepted) in 1774 after the Batty Langley Gothic styl The tower fell upon the congregation in 1810, and was replaced nir years afterwards with a notable one of modern Perpendicular Gothi crowned with an open-traceried spire, designed by Harrison, Chester, the composition being similar to that at St. Nicholas' Newcastle-on-Tyne.

Forthcoming Picture Exhibitions.

AN exhibition has been arranged to take place i London of the Italian Association of Etchers an Engravers (Associazione Italiana Aquafortisti Incisori). The Royal Society of British Artists ha offered its rooms for the exhibition. One half of tl net entries from sales will be devoted to the benefit of the Italia Red Cross. The exhibition will consist exclusively of original worl in engraving, etchings, aquatints, dry-point, woodcuts, lithograph and colour prints. The catalogue, at the wish of the London patron will have a notably artistic value as a permanent record of tl exhibition and of Italy; and we understand that his Excellency tl Italian Ambassador has signified his intention of being present the opening. The exhibition of the Aquarellisti Lombardi (Societ of Lombard Water-Colour Painters) has fixed its opening for April in the upper rooms of the "Cova" at Milan. This exhibition limited to Italian water-colour artists residing in Lombardy, althoug in some instances English water-colour artists of high standing ha received a special invitation to exhibit. Invitations have bee sent this year to Mr. John Sargent, Mrs. Laura Knight, Mr. Annir Bell, and Mr. T. Robertson. The standard of merit of variou exhibitions has been exceedingly well maintained in spite of tl existing state of war.

LONDON CHURCHES F WREN AND LATER RCHITECTS OF THE ENAISSANCE.

No. XXI.—St. Margaret Pattens.

Church of St. Margaret Pattens fronts od-lane near its junction with Eastcheap. s were formerly made and sold in Rood- he title of the church forming a reminder fact. The first church which stood on e was rebuilt in the reign of Henry VIII., ond church being destroyed in the Great The advowson of the church originally ed to the Nevill family, but in 1408 into the possession of Sir Richard ngton and other citizens, who subse- v bestowed it on the Mayor and onalty of London, and the rectory has hen continued in the gift of the Mayor orporation of London. The parish was with that of St. Gabriel Fenchurch after re.

church is not of great interest, being nplace in its detail and design and e in effect. It contains some good wood- of the usual character. The tower and re among the most interesting of Wren's , as he has here produced a design of character in terms of the Renaissance. elfry windows are square-headed and nded by an architrave, the angle les and balustrade are frankly Re- ce in detail, but the general effect of nposition is more suggestive of mediæval than that of St. Dunstan, St. Mary anbury, or St. Michael Cornhill, in churches Wren employed pseudo-Gothic It may be assumed here that Wren terested in seeing how completely the thic combination of a simple tower and ould be interpreted in another medium t the softening gradation of forms ced in later days.

HE CARPENTERS' HALL LECTURES.

Sixth Spring Art Lecture arranged by the ters' Company was given in the Hall of mpany on the 8th inst. by Mr. W. Colton, A.R.A., whose subject was Effect of War on Art." In the course remarks the lecturer said:—

think I cannot do better than to take for xt of my discourse a quotation from 's "Crown of Wild Olives," which we robably all read and most of us forgotten many years of peace :—

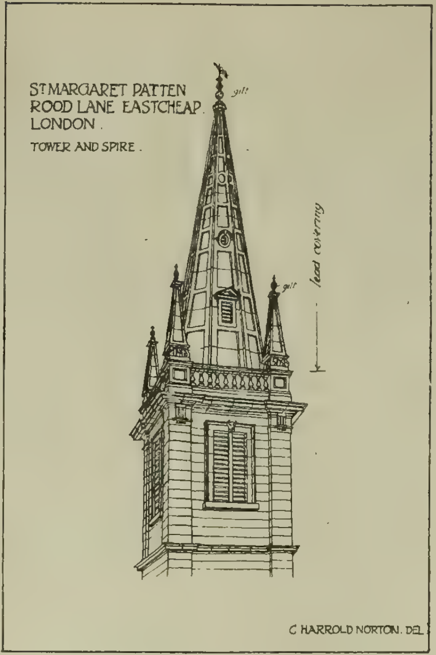
l the pure and noble arts of peace are d on war. No great art ever yet rose h but among a nation of soldiers. There art among an agricultural people if it s at peace. Commerce is barely con- with fine art, but cannot produce it. acture not only is unable to produce invariably destroys what seeds of it There is no great art possible to a but that which is based on battle.

e first dawn of it is in Egypt, and the of it is founded on the perpetual con- tion of death by the mind of a nation h the ruling caste were priests and the soldiers. The greatest works produced n are sculptures of their troops going out le or receiving the homage of conquered

om Egypt art passes directly into Greece, all poetry and all painting are nothing an the descriptive praise or dramatic ntation of war.

us," he proceeds, "the arts are ex- hed in the hands of the Romans and do e again until with Gothic chivalry there ack into the mind of Europe a passionate in war itself for the sake of war, and the fighting kings of France, England, pain and under the fighting dukeships izenships of Italy art is born again and o her height in the great valleys of rdy and Tuscany.

d from this time forward as peace is shed or extended in Europe the arts . They reach an unparalleled pitch of ess, but lose their life, enlist themselves at last on the side of luxury and various corruptions, and among wholly tranquil nations wither utterly away, remaining only in partial practice among races who like the French and us have still the minds though we cannot all live the lives of soldiers."



Ruskin, it seems to me, for the sake of fine language and complete ideas, was at times prone to overstate his case. Perhaps he underestimates the influence of religion on art, perhaps we shall see as we progress that his individual estimate of the art of countries and periods is somewhat prejudiced for the sake maybe of complete principles and rounded periods, and in his generalities he over-emphasises in some cases and does injustice in others. To my mind he despises unnecessarily the Roman nation, particularly in matters of art. I cannot but think in architecture, in their arches of triumph, the effect of war in the causation of fine art is most completely manifest. But with these reservations and in the larger view that Ruskin takes I agree with him, and I take his words, as I have said, in some ways as my text.

Photo.: Geo. Trotman.

Wren's Churches : St. Margaret Pattens, ' Tower-Street.

Of the horrors and terrors of war we all of us gathered here know enough, but we are inclined to forget that usually its effect is that of a violent tonic on the nation afflicted. Its influence is welding us once more into a social unit. It teaches us self-sacrifice for the good of an idea and of the community. It shows us clearly that selfish luxury and the accumulation of wealth are not the most important things in life or in the history of a nation. It stamps with a hall-mark what is the true gold and despises what we had begun to think real from its mere glitter. As far as art is concerned it was high time that war should come with its purifying fire. In some fifty years it had grown in Europe like unto a puffed-out and unhealthy fungus of enormous size, without beauty, without delicacy, and without health. A wave of diseased degeneracy had submerged philosophy, music, literature, and art to such a depth that, looking forward, I venture to prophesy that future centuries will gaze back with pity upon this period of mistaken morbidness.

We find perhaps in the German philosophers and musicians the first crystallised expression of this viciousness, but unfortunately we, with all other nations of Europe, cannot pretend that we are exempt. The morbid invention of the artistic mind is seen everywhere. We have Oscar Wilde, Aubrey Beardsley, and others; the Futurists, the Cubists, and whole schools of decadent novelists. We have had it also in the art of medicine, in the surgical rage for removing sundry portions of the internal organs, not when they were hopelessly diseased, but in a mad attempt to improve upon nature itself and in the taking of drugs for a special excitation of the human mind. In art, unfortunately, we cannot deny the technical skill of many of these unworthy craftsmen, and by the extent of that skill is increased the danger of the disease that has affected art.

Recently at a so-called important exhibition of sculpture a man of the world well known for his logical outlook on life, in reply to my demand, gave as his opinion that such an exhibition was to him "the direct road to hell." I am telling you this to show that the disease is fairly well recognised by others than myself and that those who know well the modern schools of thought and art cannot very well fail to agree with his verdict.

Of course you will find bordering upon the schools much art which is free from viciousness and merely foolish. An attempt to do without form in sculpture and poetry and the drama and without drawing and form in painting. A portrait may be painted with some straight lines of colour and a name, nothing else. Meaningless daubs and dashes of paint represent some profound philosophic thought which the innocent critic will discuss through columns of the credulous Press. The slides I now show you on the screen are quite innocently foolish, made for a foolish public which thinks that which it cannot understand must be profound.

In architecture we have perhaps kept saner than our neighbours and have not fallen to the new art eccentricities which are bad enough in any form of art, but in architecture meaningless desecration; doors and windows shaped like kidneys and other entrails of the human body are really anathema, but, alas! have not been unknown in Austria and Germany. In England we have run a little off the rails in producing architecture without much intention. We have elaborated the keystone to an awful extent. We use it without meaning and quite usually cut through lintels with it. We use arches without meaning simply as a decoration and we use pillars where there is nothing to support. We riot in niches containing nothing and plinths and bases with nothing upon them. The pediment has long ceased to be the end of a gable, and is more or less used at the fancy of the architect. Nevertheless, I think perhaps our architecture has kept itself healthier than most of the arts, and I certainly do not agree with the discovery of a well-known statesman that at last he understood why the blind walked the streets of London always looking happy, as they were unable to see its architecture.

In sculpture, among other crazes, we have been badly bitten by that of mutilation. We have almost decided that the complete work is not artistic, and that mutilations of a figure are. Sane England has been so far influenced that at an ordinary exhibition I have noticed that the great proportion of works were mutilated—of course, counting an ordinary bust or head as a complete work. Not content with a beautiful figure conveying some idea, it has been discovered by a certain school that to lop off a leg or two legs, perhaps an arm or two arms and a head, greatly enhances the value of an artistic production. At any rate, it leaves more to the imagination. Some bolder genius of this type has gone a step further and split off a fragment of a face for exhibition, another has a head without a crown. Another unfortunate female figure had the appearance of having been caught sitting on the railway line—she had suffered amputation of both legs at the most unfortunate section, so that two full moons or discs were presented to our gaze as supporting her in hardly an artistic or poetic fashion. Then we have had marble with black veins, fissures, and even pieces let in used from choice; point holes left showing, and so much marble rough and unfinished, that an ordinary reasonable being can see no reason for commencing.

I do plead for a sane future, when peace comes, in art, including architecture. Let us make things as beautiful as we can; let us make things as healthy as we can. I do not plead for an innocence that is childish and hypocritical, but for a delight in the sane, and that reticence that has always marked the supreme endeavour of mankind in the masterpieces of the mind. The actor to be great may not rant and rave from the beginning to the end of his act; his power must be used with discretion to be great; it must be well considered to be effective and to appear spontaneous.

All good design has always been and always will be founded upon the centuries of good design that have gone before us. Original work must come as a natural growth in continuation of what has gone before, never by way of antithesis. To teach our art worker originality of design, it is necessary that he should be acquainted with the finest designs bearing upon his work for generations past, otherwise we shall be trying to grow a flower without a stem, without leaves or a root, which is manifestly impossible.

Now, if we rapidly consider the influence of sacred and secular war upon the art of the nations we shall find that from time immemorial it has been the custom to incise or to cut in relief pictorial representations or inscriptions commemorating victories, campaigns, or incidents in those campaigns, such as kings returning from war, the siege and assault of cities, etc. In the British Museum you will find several sculptured panels from the palaces of the Kings of Assyria, dated some 700 years before Christ."

After a survey of historical art, illustrated by lantern slides, Mr. Colton concluded by saying:—

"And now I will close my very sketchy survey of the influence of war upon art by a word upon what is likely to happen in the future. If this century is to have a real record of the war through its memorials that shall be worthy of the nation, I imagine there is but one way. Never before, I am bold enough to say, has there existed such a mass of craftsmen anxiously waiting to give expression to those feelings of patriotism, sorrow, and hero worship, that, when crystallised, will produce its record in stone, marble, and bronze.

The one thing needful to success is trust in the artist whether he be sculptor, architect, or decorative painter. Those who have given their lives to the consideration of the subject are the only guides worth considering, and if you attempt to fetter them through timidity or by that so-called expert guidance that is without real knowledge and is founded on empty words then we shall fail.

A memorial must be a love gift spiritually ungrudged both by its promoters and by its artist, if it is to be valued by succeeding generations. A utilitarian value detracts from its spiritual quality. A triumphal arch should be boldly nothing but an emblem of triumph. A war memorial should express simply the nobility of the individual or the common sacrifice in terms of art. A thing of utility called a war memorial is but begging the question—beyond its usefulness it has no value in the history of the nation. Perhaps I have told you before that to commemorate Prince Albert a certain town in England proposed an elaborate scheme for a drainage scheme, to be called the Prince Albert Memorial Sewer. I need hardly say that we shall not on these lines successfully compete with the nations of the past.

We are fighting the greatest war the world has ever seen at untold sacrifice. Let us sacrifice a little more, and in our gratitude make sure that its commemoration shall stand for evermore a worthy tribute to our heroes."

THE LONDON SOCIETY.

The fourth annual meeting of the London Society was held on March 9 at the Rooms of the Royal Society of Arts, Adelphi, under the chairmanship of Sir Aston Webb, R.A.

In moving the adoption of the Report and accounts the Chairman said there was a balance on the right side, although it was small. They were just paying their way, and hoped the members by their support would enable them to continue to do so. They had lost the services of their Secretary, who had joined the forces, and amongst those they had lost by death were Sir Laurence Gomme, Lord Alverstone, and Mr. Florence. They were proposing to have a few lectures this year. Their principal work during the year had been the development plan of Greater London, which was progressing favourably. They calculated that it would cost them about £1,000, towards which they had received about £900. They would not only have a very fine plan when it was finished, but they would also have the satisfaction of knowing they had employed a certain number of men in preparing it during these trying times. When it was published they would have to issue a sort of handbook to describe all the improvements and suggestions made on the plan, and by the help of that he quite thought they would be able to make it generally attractive and interesting to the public. Another matter dealt with was that of Charing Cross railway bridge. It had been before the Society for years, but just at the moment it came up in rather an acute form. A few weeks ago Mr. Newton, the President of the Royal Institute of British Architects, and he, as representing the London Society, called attention in the Press to the fact that the South-Eastern Railway Company had promoted a Bill in Parliament for the strengthening of the bridge, and suggested that such an unsightly bridge should not be strengthened, but had better be removed. Charing Cross Bridge had been built at two different times, the first part being built lightly and the second portion more strongly. Owing to the increase in the weight of the trains the company wished to strengthen the side nearest Waterloo Bridge, and they had hit on the ingenious idea of so strengthening it with iron arches. The result would be that from the Waterloo side one would see an arched bridge, whilst from the Westminster side it would appear as a girder bridge with pontoons. One could hardly think such a proposal as that would be deliberately carried out. Fortunately the matter had gone to the House of Lords, and in the absence of Lord Plymouth, through illness, Lord Beauchamp moved an amendment to the effect that it be an instruction to the Committee to take into consideration the requirements of the traffic for the river at this point and the effect which the Bill if carried as proposed would have upon it; and to hear evidence from the Royal Instit British Architects, the London Society others. Lord Chilston, who represente railway company, agreed to the instru and said the company recognised tha bridge was unsightly and would be glad it removed. At the same time he p out that the railway company were not p thropists, and he (the speaker) was sure would misrepresent the South-Eastern Co by so describing them. The matter come up again, but if Lord Plymout successful in getting the instruction they would have reason to be satisfied a they had done for the moment. The done their work during the year quietl unostentatiously, but he hoped it had b some extent useful. Such a society coul act by suggestion. They might not b to carry all their suggestions, but the undoubtedly broaden people's intere London, and this might bring forth ver siderable improvement in the future. was only one London, and it was the of all who lived in it to make it beautif wholesome, and it was the aim of the L Society to do what it could in that way.

Sir J. Young, in seconding the motio marked that it was stated in a circular Society that the plan being prepared contain imaginative proposals. Londo lacked imaginative proposals for a ver time, and it was to be hoped that aft war a little imagination might be prac developed out of the plan for the develo of Greater London by the removal of s the eyesores and by adding to the me transit from one part to another.

Mr. Douglas Fox said the members Institution of Civil Engineers hoped able to co-operate with the architects and professional people in London to carry o excellent schemes the Society were propos

Mr. Paul asked if anything had been d get the unsightly ventilators removed the Embankment-gardens. Now the ground Railway was electrified they w longer necessary.

The Chairman said the Society ha proached the London County Council a Underground Railway Company, and bot agreeable to the removal of the venti It was the war which was responsible delay, but they would prod the auth up a little later on.

The Report was then adopted.

On the motion of Mr. A. Bowker, the members of the Council were re-elected Messrs. W. Vernon Crompton and P. F as additions.

Mr. Carmichael Thomas, in propos vote of thanks to the Chairman, referred great interest Sir Aston Webb took Society, and said it was due to him tha got the money to carry out the work paring the map.

The Chairman, in reply, said that he had not sufficiently thanked the dr men for the work they had done. It difficult task and they were doing it ext well.

LAW REPORTS.

KING'S BENCH DIVISION.

(Before Mr. Justice ROWLATT.)

chitect's Plans and Light Infringement: ote v. Minister & Co.; Minister & Co. v. Northcote & Nixon.

was an action decided by Mr. Justice tt in the King's Bench Division on last, March 10, after a week's hearing, raised points of great importance bear- the duties of architects in regard to the ation of plans where claims affecting of light were likely to arise.

plaintiff, Mr. Arthur Edward North- rchitect, 19, Tothill-street, Westminster, Messrs. Minister & Co., Ltd., fashion- printers, 40, Great Marlborough-street, inster, to recover £347 11s., on account fessional services in the preparation of for the defendants for buildings at Nos. d 56, Poland-street, Westminster. The ants alleged that the plaintiff warranted s plans that the buildings would not ge rights of light and air vested in ouring owners, and that this warranty ot carried out, and the defendants set counterclaim against Mr. Northcote and gainst Mr. Samuel Nixon, who had acted veyor for them, and who introduced Mr. cote as architect, claiming damages ting to £225, part of which had been it was said, in settling the claims of ours.

Gibbons, K.C., and Mr. Brandon were e plaintiff; Mr. Holman Gregory, K.C., Mr. Alex. Neilson were for Messrs. er & Co.; and Mr. Hollis Walker, K.C., Ir. Woodgate were for Mr. Nixon.

case was heard for a whole week, a mass of evidence being called.

substantial allegation made by Messrs. ter & Co. was that, on the faith of the of Mr. Northcote, they entered into n indentures of lease for buildings at 55 and 56, Poland-street, and it was ed that Nos. 55 and 56 interfered with r and light rights of the Roman Catholic s in the rear, and that No. 55 interfered similar rights of owners at No. 54. s. Minister & Co. eventually called in eo. Hubbard, F.R.I.B.A.

Northcote, by his reply, denied the nty alleged, and said that it was always stood that certain claims for air and would have to be dealt with, and a ation that the plans might have to be ed on account of the adjoining owners he understood, provided for in the ct with the lessors.

Nixon and Mr. Northcote gave evidence, or the other side Mr. Hubbard's evidence idavit was submitted, and various archi- were called to say that the plans did ge air and light rights. Mr. Guildford the solicitor for Messrs. Minister & Co., gave evidence.

Justice Rowlatt, in delivering judgment, hat in regard to No. 56 he thought there n infringement of the lights of the Roman lic schools, and they would have obtained junction against Messrs. Minister & Co. matter had been proceeded with. He not think that a professional man was to be infallible, but he had to be careful iligent. The case for Mr. Northcote was e was authorised to chance the matter of ights; but he was of opinion that Mr. cote misjudged the situation—he did not apply himself to the angles of light, and ossible claims of the schools were not taken into consideration. It was not a likely thing that a client would say to his ect, "I will chance it," in the sense that were to be drawn regardless of other e's rights; but it was likely that a client point out the difficulties to the archi- but tell him to go on, especially at an stage, but without limiting the architect's ation to take care. Therefore he held ase against Mr. Northcote in regard to 6 was made out.

to No. 55, the facts showed that difficulties foreseen, and his view was that when ctions were given to Mr. Northcote it understood that openings were left for fications in the plans. It was understood some little changes might have to be , but it was not intended that the plans to be so provisional that it might be sary to make alterations that amounted to lding or the making of an entirely ent place. He held that the case as to 55 against Mr. Northcote was also made

As to the counterclaim against Mr. Nixon, he thought this failed, and he could not be held liable. He gave judgment for Mr. Nixon with costs.

The accounts as between Messrs. Minister & Co. and Mr. Northcote were subsequently gone into. Judgment was entered for Mr. Northcote on his claim for fees for £256 18s. 1d. (less £96 paid), and costs, except as to the issue of negligence, as to which Messrs. Minister & Co. were awarded the costs, and judgment was entered for Messrs. Minister & Co. on the counterclaim for £375 6s. 2d., and costs.

Mr. Gibbons, K.C., said that the question of the duties of an architect were involved here, and as in regard to No. 56 it was a very fine point, he asked for a stay, as it might be desired to take the opinion of another court. The application was granted on terms.

OFFICIAL REFEREE'S COURT.

(Before Mr. MUIR MACKENZIE.)

Action for Dilapidation: Bradshaw v. Kyffin.

THE plaintiffs in this case are the trustees of certain property in Holbrook-street, Homerton, and they claimed possession of six houses in that street by reason of alleged breaches of covenants of a lease to repair. The leases were dated July, 1844, and February, 1846, for terms of seventy-eight years, and contained the usual covenants for repairs, with a proviso for re-entry in case of breach. The defendant was a sub-lessee, and notices were served upon him owing to his failure to keep the houses in repair, particularly in regard to the pantile roofs, which, it was said, were in such a condition of dilapidation as to be detrimental to the property generally, as there was danger of the rafters rotting. The notices were served under the Act on May 17, and a period of three months was fixed within which to do the repairs, and something had been done; but plaintiffs' counsel said that it was not nearly sufficient.

The defendant admitted the title, and paid into Court a sum equal to the ground rent due to date, but denied that he had neglected to repair, and claimed relief under the Act.

Mr. Harvey Dyball, architect and surveyor, of 35, Bucklersbury, who surveyed the premises, gave evidence as to the condition in which he found them. He stated that for seventeen or eighteen years he had acted as surveyor to the plaintiffs' estate, which consisted of many hundreds of houses in various parts of London.

Mr. J. P. G. Kyffin, surveyor and estate agent, of 38, Launston-road, Hackney, son of the defendant, was one of the witnesses for the defence, and his evidence was to the effect that the houses were not in the dilapidated condition alleged by the witnesses for the plaintiff.

The Official Referee, in giving judgment, said that the covenants of the lease clearly gave the plaintiff the right to re-enter in the event of a breach of the covenant to repair; but such breach had not been proved. The houses, which were a small property, were managed by the defendant's son, who apparently kept, besides an estate office, an establishment for carrying on repairs, and at the time employed a builder accustomed to do work in the neighbourhood, who from time to time repaired the houses which were the subject of action. In 1915 the plaintiff's surveyor, Mr. Dyball, surveyed the premises, and found that certain repairs were wanted, and he served notices accordingly. Repairs were done under the direction of Mr. Percy Kyffin, and he thought that all the requirements had been complied with; but Mr. Dyball again inspected the premises, and furnished further particulars. In all, the repairs done by Mr. Kyffin amounted to £63; but the plaintiffs' case was that as little was done as possible, and what had been done had been badly done. The chief complaint was in regard to the roofs, and as to these the defendant proved that he had put them in repair, and had made them watertight in August, but said that the subsequent leakage was caused by concussions which had occurred. They were old houses, and he (the Referee) was not surprised that they were shaken by the explosions. He could not find that the defendant ought to be turned out because he had adopted a method of repairing the roofs which was not in accordance with the views of the plaintiffs.' On the whole he held that the action failed, and the defendant was entitled to have it dismissed. That, however, did not prevent further action being taken in the event of the repairs specified not being done. The defendant ought to have the costs, but in awarding them he was going to make an unusual stipulation. The plaintiffs were entitled to have the premises put in repair, and he would not draw up the order for a certain time, giving the defendant liberty to apply to have the order drawn up when he was able to support it by an affidavit that the roofs had been properly repaired. When drawn up, the judgment would be for the defendant, dismissing the action with costs.

Case under the London Building Act, 1894: Notice of Work.

AT Greenwich Police-court on the 10th inst. Messrs. John Appleby & Sons, Ltd., builders and contractors, were summoned by Mr. B. Greig, District Surveyor for Deptford, for failing to serve a building notice in respect of work executed by them at their premises in Silwood-street, Southwark Park. A brick-built saw-mill partly erected about 1907 had not been completed, and one end was enclosed with a temporary wood frame, covered externally with felt. In the temporary end enclosure were certain doors and windows.

The new work, in respect of which the summons was issued, consisted of three wood posts supporting a beam at a height of about 10 ft. above the ground, from which wood rafters rose to a height of about 15 ft. against the temporary end. The span of the rafters was about 21 ft., and the structure covered an area of about 21 ft. by 33 ft. On the rafters open boarding was laid, and two tarpaulin sheets were spread thereon and tied at the edges. The tarpaulins could be taken off without affecting the timber construction. The purpose of the work was to provide shelter for work to be done at a machine-saw driven by a belt from shafting carried through the temporary end of the saw-mill. The shelter was unenclosed at the sides except where it abutted against the temporary wood and felt end, which extended to a greater height than the shelter.

The defendants pleaded not guilty. It was contended that the work formed an addition to the saw-mill, and that even if it were temporary, as the defendants stated, it should be licensed by the London County Council under sect. 83 of the London Building Act, 1894.

Mr. G. Hay Halkett decided that notice should have been served, and fined the defendants 2s. 6d. and £1 1s. costs.

PUBLIC WORKS IN AUSTRALIA.

THE Commercial Intelligence Branch of the Board of Trade is in receipt of an official statement giving details of items authorised by the South Australian Public Purposes Loan Bill, 1915, which provides for a total expenditure of £9,266,500; the following particulars of special interest are extracted therefrom:—

	£
Railways—	
Rolling stock, locomotives, machinery, and appliances for locomotive workshops, accommodation, line alterations, etc. ...	1,584.700
Railway construction	1,962.000
Harbours—	
Deepening and improvement of harbours at Port Adelaide, Port Pirie, and at outports	272 000
Murray River improvements... ...	500.000
Water supply works in districts of Adelaide, Baroota, Country, Beetaloo, Bundaleer, Barossa, Millbrook, Warren, and Pekina Creek	1,465,000
Drainage Works—	
Drainage works in South-Eastern District	300.000
Adelaide sewers	200,000
Jetties and lighthouses	42,000
Buildings—	
Erection of schoolhouses	140.000
Police barracks	22.000
Explosive magazines	2,000
Produce stores	20.000
The Magill Home	52,000
Roads	173,000
Miscellaneous works—	
Irrigation and reclamation of swamp land	300 000
Advances to settlers' and homes' funds	600 000
Sheds and tanks for settlers	25.000

GENERAL NEWS.

Presentation to Sir A. Geikie.

The bust of Sir Archibald Geikie by Professor E. Lanteri is now finished, and it is to be presented to the Board of Education.

The Friday Club.

The painter members of the Friday Club will hold their annual exhibition at the Hall of the Alpine Club, Mill-street, Conduit-street, Bond-street, W. It will consist of oil and water-colour paintings, drawings, etchings, etc. The exhibition will open to the public on Monday, March 20, and will continue till Saturday, April 8.

Patronal Window, St. Kenelm's Chapel, Clent.

In reference to this illustration, which we gave in our last issue, we have been asked to point out that the window was the first war memorial of any kind erected, and it was dedicated by an anonymous donor to the memory of children who had fallen or would fall in the present war, the subject of St. Kenelm, the child martyr, being a most appropriate one for the purpose.

Industrial Development.

Mr. Harold Cox, in an address at the Institution of Civil Engineers recently on "Industrial Development," pointed out that after the war there would be hundreds of thousands of men returning to this country looking for work, and changes would occur which would have a tremendous effect upon our social life. All important was it we should look ahead and act at once. Vague talk would not put the necessary machinery in motion. The Government Consular system he considered of little good, and he suggested the establishment of an organisation, representing practically all the trade of the country, which would develop our trade and commerce all over the world. Road-making and planning of towns and cities should be considered, and he could imagine no finer task at the end of the war than the reconstruction of the capital of the Empire.

Town Planning in Babylon.

Professor W. L. King, Assistant Keeper of Egyptian and Assyrian Antiquities in the British Museum, gave the second of a series of lectures on "Recent Excavations in Mesopotamia" at the Royal Institution recently. In recent excavations, he said, portions of the older city of Babylon had come to light, and it was shown that as early as the second millennium B.C. the streets were carefully laid out, the main thoroughfares running straight through and parallel to the river, and the others crossing them at right angles. We had in Babylon recovered what was undoubtedly the earliest attempt at town planning on scientific lines. It was only when we came to the Babylon of Nebuchadnezzar and his successors that we found traces of any building of a public character, and here the excavators had had some striking successes and one equally striking failure. They had recovered and identified Babylon's great temple, the throne of Marduk, the city god, close to the old foundations of the temple tower, the original of the Tower of Babel. They had found the gate of Ishtar, which spanned Babylon's sacred way. They had recovered Nebuchadnezzar's palace, and it was possible now for anyone to stand in the ruins of the throne-room and note the recess in the wall in which the throne was placed, or tread the endless corridors and chambers of the palace. It was in this area that the excavators made their one great failure—their proposed identification of the hanging gardens of Babylon. The descriptions left by classical writers suggested that these royal gardens towered on high above the surrounding buildings, and it had been suggested now that they lay in the north-east corner of the palace, supported by massive vaulting, but lying deep below the palace level. On this theory the gardens would have formed a sort of sunken courtyard, rather like some of our modern winter gardens. Such a construction could have caused little wonder, and it seemed more probable that the subterranean building was simply a palace granary.

Institution of Civil Engineers.

At an ordinary meeting of this Institution held on the 7th inst. Sir John Wolfe Barry, K.C.B., LL.D.(Glas.), F.R.S., was elected an honorary member, and Mr. Alfred Cecil Eborall a member. The election of forty Associate members and admission of two students was also reported.

National Gallery Purchases.

It is announced that purchases have been made by the trustees of the National Gallery:—1. "Madonna and Child," by Masaccio (from Brant Broughton), purchased with the generous assistance of the National Art Collections Fund, who contributed half the purchase-money. 2. "La Collation," by Pieter de Hooch. Both these pictures were purchased out of the interest of the Temple West Fund. The latter picture will be on exhibition in Room XIX.

Royal Society of British Artists.

In the galleries of the Royal Society of British Artists, in Suffolk-street, Pall Mall, an exhibition is to be held of the Italian Society of Etchers and Engravers in aid of the Italian Red Cross; and of the sketches by members of the Royal Society of British Artists, in aid of the Charing Cross Hospital Fund for Wounded Soldiers. The exhibition will be opened by his Excellency Marchese Guglielmo Imperiali, the Italian Ambassador, on Saturday, March 18. The exhibition will remain open until May 13.

Development of Cement-Making Industry in the Urals.

The British Vice-Consul at Ekaterinburg (Mr. T. H. Preston) reports that the first cement works were opened in the Urals at Neviansk (Ekaterinburg-Perm Railway) during 1914. Formerly the Urals as well as the whole of Western Siberia were dependent on cement transported from Russia from the Volga works at Saratov. The whole production of 500,000 barrels (about 83,333 tons) was sold during 1915. The Ural district is likely to be in the future a very extensive market for cheap cement, especially in view of its employment in the making of ferro-concrete, which is now beginning to be extensively adopted both in private buildings and in various works and factories. It is only since the opening of the new cement works in the Urals that ferro-concrete has become practicable, and it is likely to become very popular both in the Urals and Siberia. It may interest architects and builders in the United Kingdom to know that architectural and building firms, among whom Germans used to predominate, did considerable business in the Ural district in ferro-concrete structure up to July, 1914.

The Peabody Trust.

In the fifty-first annual Report of the Governors of the Peabody Donation Fund it is stated that the surplus income for the year from rents and interest was £42,453 1s. 9d., as shown by the accounts, this return being 2·25 per cent. on the capital of the fund at January 1, 1915, against 2·48 per cent. last year.—The capital expenditure on lands and buildings to the end of the year was £1,879,379 17s. 10d.—The ten blocks of self-contained tenements at Rodney-road, Walworth, were opened in March and are fully occupied.—An additional block of self-contained tenements is being built on the Bethnal Green Estate, together with hot and cold baths and a steam laundry.—The agreement with the Bridge House Committee for the purchase of a site adjoining the present Southwark Estate has been signed and sealed. Owing to the war the completion of the transaction has been postponed by arrangement with the Bridge House Committee. A site has been purchased adjoining the Camberwell Estate, on which four blocks of self-contained tenements can be built.—At the end of the year the Governors had provided for the artisan and labouring poor of London 15,885 rooms, including those occupied by the superintendents and porters, besides laundries and lavatories. These rooms provide 6,634 separate dwellings, viz., 300 cottages of five rooms, twenty-three tenements of five rooms (superintendents' quarters), 240 tenements of four rooms, 2,200 of three rooms, 2,778 of two rooms, 1,084 of one room, and nine shops with sixty-one rooms attached.

The Port of Havre.

The Commercial Intelligence Branch of Board of Trade is informed by the For Office as follows:—The French Governn desire it to be known that the Port of H is much congested, and it is consequ desirable that British exporters of goods Switzerland should send, in their own inter as little as possible by this route for the pres meantime, efforts are being made to relieve congestion.

The Great Tympanum at Westminster Cathedral.

The mosaic tympanum over the main d of Westminster Cathedral has now been exp to view. The great semicircular space five figures. The central group represents the Son attended by the Virgin Mother by St. Joseph. Christ is seated on a thr one hand raised in blessing the world. the extreme left St. Peter is shown and the extreme right St. Edward the Confes It is the work of Mr. Robert Anning A.R.A., of the Glasgow School of Art.

Demolition of St. Peter's, Liverpool.

The Church of St. Peter, Liverpool, w has for so long been the parish church of city, is to be demolished. The Order in Cou which decrees that the demolition is to carried out will not be carried into effect u the cathedral is completed, so that un existing circumstances the old church has a few more years to stand. When the chu is demolished it is supposed that the site be sold for secular purposes, the proceeds b devoted towards the cathedral endowmen

The Athenæum Index.

The Athenæum Subject Index to Periodi covers some 400 magazines and proceeding societies. The work of indexing is underta voluntarily by a number of librarians; publication is not issued for profit. The cur issue deals with the subject of Education, is the seventh of a series of twelve class covering the year 1915. An annual consoli tion will be issued later. The present contains 517 index entries, selected from journals, and distributed under 228 headi with many references in addition.

The English Chancel.
